It has been remarked, my HERMIPPUS, that though the ancient philosophers conveyed most of their instruction in the form of dialogue, this method of composition has been little practised in later ages, and has seldom succeeded in the hands of those who have attempted it. Accurate and regular argument, indeed, such as is now expected of philosophical inquirers, naturally throws a man into the methodical and didactic manner; where he can immediately, without preparation, explain the point at which he aims; and thence proceed, without interruption, to deduce the proofs on which it is established. To deliver a SYSTEM in conversation, scarcely appears natural; and while the dialogue-writer desires, by departing from the direct style of composition, to give a freer air to his performance, and avoid the appearance of *Author* and *Reader*, he is apt to run into a worse inconvenience, and convey the image of *Pedagogue* and *Pupil*. Or, if he carries on the dispute in the natural spirit of good company, by throwing in a variety of topics, and preserving a proper balance among the speakers, he often loses so much time in preparations and transitions, that the reader will scarcely think himself compensated, by all the graces of dialogue, for the order, brevity, and precision, which are sacrificed to them.

There are some subjects, however, to which dialogue-writing is peculiarly adapted, and where it is still preferable to the direct and simple method of composition.

Any point of doctrine, which is so obvious that it scarcely admits of dispute, but at the same time so *important* that it cannot be too often inculcated, seems to require some such method of handling it; where the novelty of the manner may compensate the triteness of the subject; where the vivacity of conversation may enforce the precept; and where the variety of lights, presented by various personages and characters, may appear neither tedious nor redundant.

Any question of philosophy, on the other hand, which is so *obscure* and *uncertain*, that human reason can reach no fixed determination with regard to it; if it should be treated at all, seems to lead us naturally into the style of dialogue and conversation. Reasonable men may be allowed to differ, where no one can reasonably be positive. Opposite sentiments, even without any decision, afford an agreeable amusement; and if the subject be curious and interesting, the book carries us, in a manner, into company; and unites the two greatest and purest pleasures of human life, study and society.

Happily, these circumstances are all to be found in the subject of NATURAL RELIGION. What truth so obvious, so certain, as the *being* of a God, which the most ignorant ages have acknowledged, for which the most refined geniuses have ambitiously striven to produce new proofs and arguments? What truth so important as this, which is the ground of all our hopes, the surest foundation of morality, the firmest support of society, and the only principle which ought never to be a moment absent from our thoughts and meditations? But, in treating of this obvious and important truth, what obscure questions occur concerning the *nature* of that Divine Being, his attributes, his decrees, his plan of providence? These have been always subjected to the disputations of men; concerning these human reason has not reached any certain determination. But these are topics so interesting, that we cannot restrain our restless inquiry with regard to them; though nothing but doubt, uncertainty, and contradiction, have as yet been the result of our most accurate researches.

This I had lately occasion to observe, while I passed, as usual, part of the summer season with CLEANTHES, and was present at those conversations of his with PHILO and DEMEA, of which I gave you lately some imperfect account. Your curiosity, you then told me, was so excited, that I must, of necessity, enter into a more exact detail of their reasonings, and display those various systems which they advanced with regard to so delicate a subject as that of natural religion. The remarkable contrast in their characters still further raised your expectations; while you opposed the accurate philosophical turn of CLEANTHES to the careless scepticism of PHILO, or compared either of their dispositions with the rigid inflexible orthodoxy of DEMEA. My youth rendered me a mere auditor of their disputes; and that curiosity, natural to the early season of life, has so deeply imprinted in my memory the whole chain and connection of their arguments, that, I hope, I shall not omit or confound any considerable part of them in the recital.

Dialogues Concerning Natural Religion

David Hume

1779

PART 1

After I joined the company, whom I found sitting in CLEANTHES's library, DEMEA paid CLEANTHES some compliments on the great care which he took of my education, and on his unwearied perseverance and constancy in all his friendships. The father of PAMPHILUS, said he, was your intimate friend: The son is your pupil; and may indeed be regarded as your adopted son, were we to judge by the pains which you bestow in conveying to him every useful branch of literature and science. You are no more wanting, I am persuaded, in prudence, than in industry. I shall, therefore, communicate to you a maxim, which I have observed with regard to my own children, that I may learn how far it agrees with your practice. The method I follow in their education is founded on the saying of an ancient, "That students of philosophy ought first to learn logics, then ethics, next physics, last of all the nature of the gods."[12] This science of natural theology, according to him, being the most profound and abstruse of any, required the maturest judgement in its students; and none but a mind enriched with all the other sciences, can safely be entrusted with it.

Are you so late, says PHILO, in teaching your children the principles of religion? Is there no danger of their neglecting, or rejecting altogether those opinions of which they have heard so little during the whole course of their education? It is only as a science, replied DEMEA, subjected to human reasoning and disputation, that I postpone the study of Natural Theology. To season their minds with early piety, is my chief care; and by continual precept and instruction, and I hope too by example, I imprint deeply on their tender minds an habitual reverence for all the principles of religion. While they pass through every other science, I still remark the uncertainty of each part;

the eternal disputations of men; the obscurity of all philosophy; and the strange, ridiculous conclusions, which some of the greatest geniuses have derived from the principles of mere human reason. Having thus tamed their mind to a proper submission and self-diffidence, I have no longer any scruple of opening to them the greatest mysteries of religion; nor apprehend any danger from that assuming arrogance of philosophy, which may lead them to reject the most established doctrines and opinions.

Your precaution, says PHILO, of seasoning your children's minds early with piety, is certainly very reasonable; and no more than is requisite in this profane and irreligious age. But what I chiefly admire in your plan of education, is your method of drawing advantage from the very principles of philosophy and learning, which, by inspiring pride and self-sufficiency, have commonly, in all ages, been found so destructive to the principles of religion. The vulgar, indeed, we may remark, who are unacquainted with science and profound inquiry, observing the endless disputes of the learned, have commonly a thorough contempt for philosophy; and rivet themselves the faster, by that means, in the great points of theology which have been taught them. Those who enter a little into study and study and inquiry, finding many appearances of evidence in doctrines the newest and most extraordinary, think nothing too difficult for human reason; and, presumptuously breaking through all fences, profane the inmost sanctuaries of the temple. But CLEANTHES will, I hope, agree with me, that, after we have abandoned ignorance, the surest remedy, there is still one expedient left to prevent this profane liberty. Let DEMEA's principles be improved and cultivated: Let us become thoroughly sensible of the weakness, blindness, and narrow limits of human reason: Let us duly consider its uncertainty and endless contrarieties, even in subjects of common life and practice: Let the errors and deceits of our very senses be set before us; the insuperable difficulties which attend first principles in all systems; the contradictions which adhere to the very ideas of matter, cause and effect, extension, space, time, motion; and in a word, quantity of all kinds, the object of the only science that can fairly pretend to any certainty or evidence. When these topics are displayed in their full light, as they are by some philosophers and almost all divines; who can retain such confidence in this frail faculty of reason as to pay any regard to its determinations in points so sublime, so abstruse, so remote from common life and experience? When the coherence of the parts of a stone, or even that composition of parts which renders it extended; when these familiar objects, I say, are so inexplicable, and contain circumstances so repugnant and contradictory; with what assurance can we decide concerning the origin of worlds, or trace their history from eternity to eternity?

While PHILO pronounced these words, I could observe a smile in the countenance both of DEMEA and CLEANTHES. That of DEMEA seemed to imply an unreserved satisfaction in the doctrines delivered: But, in CLEANTHES's features, I could distinguish an air of finesse; as if he perceived some raillery or artificial malice in the reasonings of PHILO.

You propose then, PHILO, said CLEANTHES, to erect religious faith on philosophical scepticism; and you think, that if certainty or evidence be expelled from every other subject of inquiry, it will all retire to these theological doctrines, and there acquire a superior force and authority. Whether your scepticism be as absolute and sincere as you pretend, we shall learn by and by, when the company breaks up: We shall then see, whether you go out at the door or the window; and whether you really doubt if your body has gravity, or can be injured by its fall; according to popular opinion, derived from our fallacious senses, and more fallacious experience. And this consideration, DEMEA, may, I think, fairly serve to abate our ill-will to this humorous sect of the sceptics. If they be thoroughly in earnest, they will not long trouble the world with their doubts,

cavils, and disputes: If they be only in jest, they are, perhaps, bad raillers; but can never be very dangerous, either to the state, to philosophy, or to religion.

In reality, PHILO, continued he, it seems certain, that though a man, in a flush of humour, after intense reflection on the many contradictions and imperfections of human reason, may entirely renounce all belief and opinion, it is impossible for him to persevere in this total scepticism, or make it appear in his conduct for a few hours. External objects press in upon him; passions solicit him; his philosophical melancholy dissipates; and even the utmost violence upon his own temper will not be able, during any time, to preserve the poor appearance of scepticism. And for what reason impose on himself such a violence? This is a point in which it will be impossible for him ever to satisfy himself, consistently with his sceptical principles. So that, upon the whole, nothing could be more ridiculous than the principles of the ancient PYRRHONIANS; if in reality they endeavoured, as is pretended, to extend, throughout, the same scepticism which they had learned from the declamations of their schools, and which they ought to have confined to them.

In this view, there appears a great resemblance between the sects of the STOICS and PYRRHONIANS, though perpetual antagonists; and both of them seem founded on this erroneous maxim, That what a man can perform sometimes, and in some dispositions, he can perform always, and in every disposition. When the mind, by Stoical reflections, is elevated into a sublime enthusiasm of virtue, and strongly smit with any species of honour or public good, the utmost bodily pain and sufferings will not prevail over such a high sense of duty; and it is possible, perhaps, by its means, even to smile and exult in the midst of tortures. If this sometimes may be the case in fact and reality, much more may a philosopher, in his school, or even in his closet, work himself up to such an enthusiasm, and support in imagination the acutest pain or most calamitous event which he can possibly conceive. But how shall he support this enthusiasm itself? The bent of his mind relaxes, and cannot be recalled at pleasure; avocations lead him astray; misfortunes attack him unawares; and the *philosopher* sinks by degrees into the *plebeian*.

I allow of your comparison between the STOICS and SKEPTICS, replied PHILO. But you may observe, at the same time, that though the mind cannot, in Stoicism, support the highest flights of philosophy, yet, even when it sinks lower, it still retains somewhat of its former disposition; and the effects of the Stoic's reasoning will appear in his conduct in common life, and through the whole tenor of his actions. The ancient schools, particularly that of ZENO, produced examples of virtue and constancy which seem astonishing to present times.

> **Vain Wisdom all and false Philosophy.**
> **Yet with a pleasing sorcery could charm**
> **Pain, for a while, or anguish; and excite**
> **Fallacious Hope, or arm the obdurate breast**
> **With stubborn Patience, as with triple steel.[13]**

In like manner, if a man has accustomed himself to sceptical considerations on the uncertainty and narrow limits of reason, he will not entirely forget them when he turns his reflection on other subjects; but in all his philosophical principles and reasoning, I dare not say in his common conduct, he will be found different from those, who either never formed any opinions in the case, or have entertained sentiments more favourable to human reason.

To whatever length any one may push his speculative principles of scepticism, he must act, I own, and live, and converse, like other men; and for this conduct he is not obliged to give any other reason, than the absolute necessity he lies under of so doing. If he ever carries his speculations

further than this necessity constrains him, and philosophises either on natural or moral subjects, he is allured by a certain pleasure and satisfaction which he finds in employing himself after that manner. He considers besides, that every one, even in common life, is constrained to have more or less of this philosophy; that from our earliest infancy we make continual advances in forming more general principles of conduct and reasoning; that the larger experience we acquire, and the stronger reason we are endued with, we always render our principles the more general and comprehensive; and that what we call *philosophy* is nothing but a more regular and methodical operation of the same kind. To philosophise on such subjects, is nothing essentially different from reasoning on common life; and we may only expect greater stability, if not greater truth, from our philosophy, on account of its exacter and more scrupulous method of proceeding.

But when we look beyond human affairs and the properties of the surrounding bodies: when we carry our speculations into the two eternities, before and after the present state of things; into the creation and formation of the universe; the existence and properties of spirits; the powers and operations of one universal Spirit existing without beginning and without end; omnipotent, omniscient, immutable, infinite, and incomprehensible: We must be far removed from the smallest tendency to scepticism not to be apprehensive, that we have here got quite beyond the reach of our faculties. So long as we confine our speculations to trade, or morals, or politics, or criticism, we make appeals, every moment, to common sense and experience, which strengthen our philosophical conclusions, and remove, at least in part, the suspicion which we so justly entertain with regard to every reasoning that is very subtle and refined. But, in theological reasonings, we have not this advantage; while, at the same time, we are employed upon objects, which, we must be sensible, are too large for our grasp, and of all others, require most to be familiarised to our apprehension. We are like foreigners in a strange country, to whom every thing must seem suspicious, and who are in danger every moment of transgressing against the laws and customs of the people with whom they live and converse. We know not how far we ought to trust our vulgar methods of reasoning in such a subject; since, even in common life, and in that province which is peculiarly appropriated to them, we cannot account for them, and are entirely guided by a kind of instinct or necessity in employing them.

All sceptics pretend, that, if reason be considered in an abstract view, it furnishes invincible arguments against itself; and that we could never retain any conviction or assurance, on any subject, were not the sceptical reasonings so refined and subtle, that they are not able to counterpoise the more solid and more natural arguments derived from the senses and experience. But it is evident, whenever our arguments lose this advantage, and run wide of common life, that the most refined scepticism comes to be upon a footing with them, and is able to oppose and counterbalance them. The one has no more weight than the other. The mind must remain in suspense between them; and it is that very suspense or balance, which is the triumph of scepticism.

But I observe, says CLEANTHES, with regard to you, PHILO, and all speculative sceptics, that your doctrine and practice are as much at variance in the most abstruse points of theory as in the conduct of common life. Wherever evidence discovers itself, you adhere to it, notwithstanding your pretended scepticism; and I can observe, too, some of your sect to be as decisive as those who make greater professions of certainty and assurance. In reality, would not a man be ridiculous, who pretended to reject NEWTON's explication of the wonderful phenomenon of the rainbow, because that explication gives a minute anatomy of the rays of light; a subject, forsooth, too refined for human comprehension? And what would you say to one, who, having nothing particular to object to the arguments of COPERNICUS and GALILEO for the motion of the earth, should withhold his

assent, on that general principle, that these subjects were too magnificent and remote to be explained by the narrow and fallacious reason of mankind?

There is indeed a kind of brutish and ignorant scepticism, as you well observed, which gives the vulgar a general prejudice against what they do not easily understand, and makes them reject every principle which requires elaborate reasoning to prove and establish it. This species of scepticism is fatal to knowledge, not to religion; since we find, that those who make greatest profession of it, give often their assent, not only to the great truths of Theism and natural theology, but even to the most absurd tenets which a traditional superstition has recommended to them. They firmly believe in witches, though they will not believe nor attend to the most simple proposition of Euclid. But the refined and philosophical sceptics fall into an inconsistence of an opposite nature. They push their researches into the most abstruse corners of science; and their assent attends them in every step, proportioned to the evidence which they meet with. They are even obliged to acknowledge, that the most abstruse and remote objects are those which are best explained by philosophy. Light is in reality anatomised. The true system of the heavenly bodies is discovered and ascertained. But the nourishment of bodies by food is still an inexplicable mystery. The cohesion of the parts of matter is still incomprehensible. These sceptics, therefore, are obliged, in every question, to consider each particular evidence apart, and proportion their assent to the precise degree of evidence which occurs. This is their practice in all natural, mathematical, moral, and political science. And why not the same, I ask, in the theological and religious? Why must conclusions of this nature be alone rejected on the general presumption of the insufficiency of human reason, without any particular discussion of the evidence? Is not such an unequal conduct a plain proof of prejudice and passion?

Our senses, you say, are fallacious; our understanding erroneous; our ideas, even of the most familiar objects, extension, duration, motion, full of absurdities and contradictions. You defy me to solve the difficulties, or reconcile the repugnancies which you discover in them. I have not capacity for so great an undertaking: I have not leisure for it: I perceive it to be superfluous. Your own conduct, in every circumstance, refutes your principles, and shows the firmest reliance on all the received maxims of science, morals, prudence, and behaviour.

I shall never assent to so harsh an opinion as that of a celebrated writer,[14] who says, that the Sceptics are not a sect of philosophers: They are only a sect of liars. I may, however, affirm (I hope without offence), that they are a sect of jesters or raillers. But for my part, whenever I find myself disposed to mirth and amusement, I shall certainly choose my entertainment of a less perplexing and abstruse nature. A comedy, a novel, or at most a history, seems a more natural recreation than such metaphysical subtleties and abstractions.

In vain would the sceptic make a distinction between science and common life, or between one science and another. The arguments employed in all, if just, are of a similar nature, and contain the same force and evidence. Or if there be any difference among them, the advantage lies entirely on the side of theology and natural religion. Many principles of mechanics are founded on very abstruse reasoning; yet no man who has any pretensions to science, even no speculative sceptic, pretends to entertain the least doubt with regard to them. The COPERNICAN system contains the most surprising paradox, and the most contrary to our natural conceptions, to appearances, and to our very senses: yet even monks and inquisitors are now constrained to withdraw their opposition to it. And shall PHILO, a man of so liberal a genius and extensive knowledge, entertain any general undistinguished scruples with regard to the religious hypothesis, which is founded on the simplest

and most obvious arguments, and, unless it meets with artificial obstacles, has such easy access and admission into the mind of man?

And here we may observe, continued he, turning himself towards DEMEA, a pretty curious circumstance in the history of the sciences. After the union of philosophy with the popular religion, upon the first establishment of Christianity, nothing was more usual, among all religious teachers, than declamations against reason, against the senses, against every principle derived merely from human research and inquiry. All the topics of the ancient academics were adopted by the fathers; and thence propagated for several ages in every school and pulpit throughout Christendom. The Reformers embraced the same principles of reasoning, or rather declamation; and all panegyrics on the excellency of faith, were sure to be interlarded with some severe strokes of satire against natural reason. A celebrated prelate too,[15] of the Romish communion, a man of the most extensive learning, who wrote a demonstration of Christianity, has also composed a treatise, which contains all the cavils of the boldest and most determined PYRRHONISM. LOCKE seems to have been the first Christian who ventured openly to assert, that *faith* was nothing but a species of *reason*; that religion was only a branch of philosophy; and that a chain of arguments, similar to that which established any truth in morals, politics, or physics, was always employed in discovering all the principles of theology, natural and revealed. The ill use which BAYLE and other libertines made of the philosophical scepticism of the fathers and first reformers, still further propagated the judicious sentiment of Mr. LOCKE: And it is now in a manner avowed, by all pretenders to reasoning and philosophy, that Atheist and Sceptic are almost synonymous. And as it is certain that no man is in earnest when he professes the latter principle, I would fain hope that there are as few who seriously maintain the former.

Don't you remember, said PHILO, the excellent saying of LORD BACON on this head? That a little philosophy, replied CLEANTHES, makes a man an Atheist: A great deal converts him to religion. That is a very judicious remark too, said PHILO. But what I have in my eye is another passage, where, having mentioned DAVID's fool, who said in his heart there is no God, this great philosopher observes, that the Atheists nowadays have a double share of folly; for they are not contented to say in their hearts there is no God, but they also utter that impiety with their lips, and are thereby guilty of multiplied indiscretion and imprudence. Such people, though they were ever so much in earnest, cannot, methinks, be very formidable.

But though you should rank me in this class of fools, I cannot forbear communicating a remark that occurs to me, from the history of the religious and irreligious scepticism with which you have entertained us. It appears to me, that there are strong symptoms of priestcraft in the whole progress of this affair. During ignorant ages, such as those which followed the dissolution of the ancient schools, the priests perceived, that Atheism, Deism, or heresy of any kind, could only proceed from the presumptuous questioning of received opinions, and from a belief that human reason was equal to every thing. Education had then a mighty influence over the minds of men, and was almost equal in force to those suggestions of the senses and common understanding, by which the most determined sceptic must allow himself to be governed. But at present, when the influence of education is much diminished, and men, from a more open commerce of the world, have learned to compare the popular principles of different nations and ages, our sagacious divines have changed their whole system of philosophy, and talk the language of STOICS, PLATONISTS, and PERIPATETICS, not that of PYRRHONIANS and ACADEMICS. If we distrust human reason, we have now no other principle to lead us into religion. Thus, sceptics in one age, dogmatists in another; whichever system best suits the purpose of these reverend gentlemen, in giving them an

ascendant over mankind, they are sure to make it their favourite principle, and established tenet.

It is very natural, said CLEANTHES, for men to embrace those principles, by which they find they can best defend their doctrines; nor need we have any recourse to priestcraft to account for so reasonable an expedient. And, surely nothing can afford a stronger presumption, that any set of principles are true, and ought to be embraced, than to observe that they tend to the confirmation of true religion, and serve to confound the cavils of Atheists, Libertines, and Freethinkers of all denominations.

Dialogues Concerning Natural Religion

David Hume

1779

PART 2

I must own, CLEANTHES, said DEMEA, that nothing can more surprise me, than the light in which you have all along put this argument. By the whole tenor of your discourse, one would imagine that you were maintaining the Being of a God, against the cavils of Atheists and Infidels; and were necessitated to become a champion for that fundamental principle of all religion. But this, I hope, is not by any means a question among us. No man, no man at least of common sense, I am persuaded, ever entertained a serious doubt with regard to a truth so certain and self-evident. The question is not concerning the *being*, but the *nature* of *God*. This, I affirm, from the infirmities of human understanding, to be altogether incomprehensible and unknown to us. The essence of that supreme Mind, his attributes, the manner of his existence, the very nature of his duration; these, and every particular which regards so divine a Being, are mysterious to men. Finite, weak, and blind creatures, we ought to humble ourselves in his august presence; and, conscious of our frailties, adore in silence his infinite perfections, which eye hath not seen, ear hath not heard, neither hath it entered into the heart of man to conceive. They are covered in a deep cloud from human curiosity. It is profaneness to attempt penetrating through these sacred obscurities. And, next to the impiety of denying his existence, is the temerity of prying into his nature and essence, decrees and attributes.

But lest you should think that my *piety* has here got the better of my *philosophy*, I shall support my opinion, if it needs any support, by a very great authority. I might cite all the divines, almost, from the foundation of Christianity, who have ever treated of this or any other theological subject: But I shall confine myself, at present, to one equally celebrated for piety and philosophy. It is Father

MALEBRANCHE, who, I remember, thus expresses himself.[16] "One ought not so much," says he, "to call God a spirit, in order to express positively what he is, as in order to signify that he is not matter. He is a Being infinitely perfect: Of this we cannot doubt. But in the same manner as we ought not to imagine, even supposing him corporeal, that he is clothed with a human body, as the ANTHROPOMORPHITES asserted, under colour that that figure was the most perfect of any; so, neither ought we to imagine that the spirit of God has human ideas, or bears any resemblance to our spirit, under colour that we know nothing more perfect than a human mind. We ought rather to believe, that as he comprehends the perfections of matter without being material.... he comprehends also the perfections of created spirits without being spirit, in the manner we conceive spirit: That his true name is, *He that is*; or, in other words, Being without restriction, All Being, the Being infinite and universal."

After so great an authority, DEMEA, replied PHILO, as that which you have produced, and a thousand more which you might produce, it would appear ridiculous in me to add my sentiment, or express my approbation of your doctrine. But surely, where reasonable men treat these subjects, the question can never be concerning the *Being*, but only the *Nature*, of the Deity. The former truth, as you well observe, is unquestionable and self-evident. Nothing exists without a cause; and the original cause of this universe (whatever it be) we call God; and piously ascribe to him every species of perfection. Whoever scruples this fundamental truth, deserves every punishment which can be inflicted among philosophers, to wit, the greatest ridicule, contempt, and disapprobation. But as all perfection is entirely relative, we ought never to imagine that we comprehend the attributes of this divine Being, or to suppose that his perfections have any analogy or likeness to the perfections of a human creature. Wisdom, Thought, Design, Knowledge; these we justly ascribe to him; because these words are honourable among men, and we have no other language or other conceptions by which we can express our adoration of him. But let us beware, lest we think that our ideas anywise correspond to his perfections, or that his attributes have any resemblance to these qualities among men. He is infinitely superior to our limited view and comprehension; and is more the object of worship in the temple, than of disputation in the schools.

In reality, CLEANTHES, continued he, there is no need of having recourse to that affected scepticism so displeasing to you, in order to come at this determination. Our ideas reach no further than our experience. We have no experience of divine attributes and operations. I need not conclude my syllogism. You can draw the inference yourself. And it is a pleasure to me (and I hope to you too) that just reasoning and sound piety here concur in the same conclusion, and both of them establish the adorably mysterious and incomprehensible nature of the Supreme Being.

Not to lose any time in circumlocutions, said CLEANTHES, addressing himself to DEMEA, much less in replying to the pious declamations of PHILO; I shall briefly explain how I conceive this matter. Look round the world: contemplate the whole and every part of it: You will find it to be nothing but one great machine, subdivided into an infinite number of lesser machines, which again admit of subdivisions to a degree beyond what human senses and faculties can trace and explain. All these various machines, and even their most minute parts, are adjusted to each other with an accuracy which ravishes into admiration all men who have ever contemplated them. The curious adapting of means to ends, throughout all nature, resembles exactly, though it much exceeds, the productions of human contrivance; of human designs, thought, wisdom, and intelligence. Since, therefore, the effects resemble each other, we are led to infer, by all the rules of analogy, that the causes also resemble; and that the Author of Nature is somewhat similar to the mind of man, though possessed of much larger faculties, proportioned to the grandeur of the work which he has

executed. By this argument *a posteriori*, and by this argument alone, do we prove at once the existence of a Deity, and his similarity to human mind and intelligence.

I shall be so free, CLEANTHES, said DEMEA, as to tell you, that from the beginning, I could not approve of your conclusion concerning the similarity of the Deity to men; still less can I approve of the mediums by which you endeavour to establish it. What! No demonstration of the Being of God! No abstract arguments! No proofs *a priori*! Are these, which have hitherto been so much insisted on by philosophers, all fallacy, all sophism? Can we reach no further in this subject than experience and probability? I will not say that this is betraying the cause of a Deity: But surely, by this affected candour, you give advantages to Atheists, which they never could obtain by the mere dint of argument and reasoning.

What I chiefly scruple in this subject, said PHILO, is not so much that all religious arguments are by CLEANTHES reduced to experience, as that they appear not to be even the most certain and irrefragable of that inferior kind. That a stone will fall, that fire will burn, that the earth has solidity, we have observed a thousand and a thousand times; and when any new instance of this nature is presented, we draw without hesitation the accustomed inference. The exact similarity of the cases gives us a perfect assurance of a similar event; and a stronger evidence is never desired nor sought after. But wherever you depart, in the least, from the similarity of the cases, you diminish proportionably the evidence; and may at last bring it to a very weak *analogy*, which is confessedly liable to error and uncertainty. After having experienced the circulation of the blood in human creatures, we make no doubt that it takes place in TITIUS and MAEVIUS. But from its circulation in frogs and fishes, it is only a presumption, though a strong one, from analogy, that it takes place in men and other animals. The analogical reasoning is much weaker, when we infer the circulation of the sap in vegetables from our experience that the blood circulates in animals; and those, who hastily followed that imperfect analogy, are found, by more accurate experiments, to have been mistaken.

If we see a house, CLEANTHES, we conclude, with the greatest certainty, that it had an architect or builder; because this is precisely that species of effect which we have experienced to proceed from that species of cause. But surely you will not affirm, that the universe bears such a resemblance to a house, that we can with the same certainty infer a similar cause, or that the analogy is here entire and perfect. The dissimilitude is so striking, that the utmost you can here pretend to is a guess, a conjecture, a presumption concerning a similar cause; and how that pretension will be received in the world, I leave you to consider.

It would surely be very ill received, replied CLEANTHES; and I should be deservedly blamed and detested, did I allow, that the proofs of a Deity amounted to no more than a guess or conjecture. But is the whole adjustment of means to ends in a house and in the universe so slight a resemblance? The economy of final causes? The order, proportion, and arrangement of every part? Steps of a stair are plainly contrived, that human legs may use them in mounting; and this inference is certain and infallible. Human legs are also contrived for walking and mounting; and this inference, I allow, is not altogether so certain, because of the dissimilarity which you remark; but does it, therefore, deserve the name only of presumption or conjecture?[17]

Good God! cried DEMEA, interrupting him, where are we? Zealous defenders of religion allow, that the proofs of a Deity fall short of perfect evidence! And you, PHILO, on whose assistance I depended in proving the adorable mysteriousness of the Divine Nature, do you assent to all these extravagant opinions of CLEANTHES? For what other name can I give them? or, why spare my

censure, when such principles are advanced, supported by such an authority, before so young a man as PAMPHILUS?

You seem not to apprehend, replied PHILO, that I argue with CLEANTHES in his own way; and, by showing him the dangerous consequences of his tenets, hope at last to reduce him to our opinion. But what sticks most with you, I observe, is the representation which CLEANTHES has made of the argument *a posteriori*; and finding that that argument is likely to escape your hold and vanish into air, you think it so disguised, that you can scarcely believe it to be set in its true light. Now, however much I may dissent, in other respects, from the dangerous principles of CLEANTHES, I must allow that he has fairly represented that argument; and I shall endeavour so to state the matter to you, that you will entertain no further scruples with regard to it.

Were a man to abstract from every thing which he knows or has seen, he would be altogether incapable, merely from his own ideas, to determine what kind of scene the universe must be, or to give the preference to one state or situation of things above another. For as nothing which he clearly conceives could be esteemed impossible or implying a contradiction, every chimera of his fancy would be upon an equal footing; nor could he assign any just reason why he adheres to one idea or system, and rejects the others which are equally possible.

Again; after he opens his eyes, and contemplates the world as it really is, it would be impossible for him at first to assign the cause of any one event, much less of the whole of things, or of the universe. He might set his fancy a rambling; and she might bring him in an infinite variety of reports and representations. These would all be possible; but being all equally possible, he would never of himself give a satisfactory account for his preferring one of them to the rest. Experience alone can point out to him the true cause of any phenomenon.

Now, according to this method of reasoning, DEMEA, it follows, (and is, indeed, tacitly allowed by CLEANTHES himself,) that order, arrangement, or the adjustment of final causes, is not of itself any proof of design; but only so far as it has been experienced to proceed from that principle. For aught we can know *a priori*, matter may contain the source or spring of order originally within itself, as well as mind does; and there is no more difficulty in conceiving, that the several elements, from an internal unknown cause, may fall into the most exquisite arrangement, than to conceive that their ideas, in the great universal mind, from a like internal unknown cause, fall into that arrangement. The equal possibility of both these suppositions is allowed. But, by experience, we find, (according to CLEANTHES), that there is a difference between them. Throw several pieces of steel together, without shape or form; they will never arrange themselves so as to compose a watch. Stone, and mortar, and wood, without an architect, never erect a house. But the ideas in a human mind, we see, by an unknown, inexplicable economy, arrange themselves so as to form the plan of a watch or house. Experience, therefore, proves, that there is an original principle of order in mind, not in matter. From similar effects we infer similar causes. The adjustment of means to ends is alike in the universe, as in a machine of human contrivance. The causes, therefore, must be resembling.

I was from the beginning scandalised, I must own, with this resemblance, which is asserted, between the Deity and human creatures; and must conceive it to imply such a degradation of the Supreme Being as no sound Theist could endure. With your assistance, therefore, DEMEA, I shall endeavour to defend what you justly call the adorable mysteriousness of the Divine Nature, and shall refute this reasoning of CLEANTHES, provided he allows that I have made a fair representation of it.

When CLEANTHES had assented, PHILO, after a short pause, proceeded in the following manner.

That all inferences, CLEANTHES, concerning fact, are founded on experience; and that all experimental reasonings are founded on the supposition that similar causes prove similar effects, and similar effects similar causes; I shall not at present much dispute with you. But observe, I entreat you, with what extreme caution all just reasoners proceed in the transferring of experiments to similar cases. Unless the cases be exactly similar, they repose no perfect confidence in applying their past observation to any particular phenomenon. Every alteration of circumstances occasions a doubt concerning the event; and it requires new experiments to prove certainly, that the new circumstances are of no moment or importance. A change in bulk, situation, arrangement, age, disposition of the air, or surrounding bodies; any of these particulars may be attended with the most unexpected consequences: And unless the objects be quite familiar to us, it is the highest temerity to expect with assurance, after any of these changes, an event similar to that which before fell under our observation. The slow and deliberate steps of philosophers here, if any where, are distinguished from the precipitate march of the vulgar, who, hurried on by the smallest similitude, are incapable of all discernment or consideration.

But can you think, CLEANTHES, that your usual phlegm and philosophy have been preserved in so wide a step as you have taken, when you compared to the universe houses, ships, furniture, machines, and, from their similarity in some circumstances, inferred a similarity in their causes? Thought, design, intelligence, such as we discover in men and other animals, is no more than one of the springs and principles of the universe, as well as heat or cold, attraction or repulsion, and a hundred others, which fall under daily observation. It is an active cause, by which some particular parts of nature, we find, produce alterations on other parts. But can a conclusion, with any propriety, be transferred from parts to the whole? Does not the great disproportion bar all comparison and inference? From observing the growth of a hair, can we learn any thing concerning the generation of a man? Would the manner of a leaf's blowing, even though perfectly known, afford us any instruction concerning the vegetation of a tree?

But, allowing that we were to take the operations of one part of nature upon another, for the foundation of our judgement concerning the *origin* of the whole, (which never can be admitted,) yet why select so minute, so weak, so bounded a principle, as the reason and design of animals is found to be upon this planet? What peculiar privilege has this little agitation of the brain which we call thought, that we must thus make it the model of the whole universe? Our partiality in our own favour does indeed present it on all occasions; but sound philosophy ought carefully to guard against so natural an illusion.

So far from admitting, continued PHILO, that the operations of a part can afford us any just conclusion concerning the origin of the whole, I will not allow any one part to form a rule for another part, if the latter be very remote from the former. Is there any reasonable ground to conclude, that the inhabitants of other planets possess thought, intelligence, reason, or any thing similar to these faculties in men? When nature has so extremely diversified her manner of operation in this small globe, can we imagine that she incessantly copies herself throughout so immense a universe? And if thought, as we may well suppose, be confined merely to this narrow corner, and has even there so limited a sphere of action, with what propriety can we assign it for the original cause of all things? The narrow views of a peasant, who makes his domestic economy the rule for the government of kingdoms, is in comparison a pardonable sophism.

But were we ever so much assured, that a thought and reason, resembling the human, were to be

found throughout the whole universe, and were its activity elsewhere vastly greater and more commanding than it appears in this globe; yet I cannot see, why the operations of a world constituted, arranged, adjusted, can with any propriety be extended to a world which is in its embryo state, and is advancing towards that constitution and arrangement. By observation, we know somewhat of the economy, action, and nourishment of a finished animal; but we must transfer with great caution that observation to the growth of a foetus in the womb, and still more to the formation of an animalcule in the loins of its male parent. Nature, we find, even from our limited experience, possesses an infinite number of springs and principles, which incessantly discover themselves on every change of her position and situation. And what new and unknown principles would actuate her in so new and unknown a situation as that of the formation of a universe, we cannot, without the utmost temerity, pretend to determine.

A very small part of this great system, during a very short time, is very imperfectly discovered to us; and do we thence pronounce decisively concerning the origin of the whole?

Admirable conclusion! Stone, wood, brick, iron, brass, have not, at this time, in this minute globe of earth, an order or arrangement without human art and contrivance; therefore the universe could not originally attain its order and arrangement, without something similar to human art. But is a part of nature a rule for another part very wide of the former? Is it a rule for the whole? Is a very small part a rule for the universe? Is nature in one situation, a certain rule for nature in another situation vastly different from the former?

And can you blame me, CLEANTHES, if I here imitate the prudent reserve of SIMONIDES, who, according to the noted story,[18] being asked by HIERO, *What God was*? desired a day to think of it, and then two days more; and after that manner continually prolonged the term, without ever bringing in his definition or description? Could you even blame me, if I had answered at first, *that I did not know*, and was sensible that this subject lay vastly beyond the reach of my faculties? You might cry out sceptic and railler, as much as you pleased: but having found, in so many other subjects much more familiar, the imperfections and even contradictions of human reason, I never should expect any success from its feeble conjectures, in a subject so sublime, and so remote from the sphere of our observation. When two *species* of objects have always been observed to be conjoined together, I can *infer*, by custom, the existence of one wherever I *see* the existence of the other; and this I call an argument from experience. But how this argument can have place, where the objects, as in the present case, are single, individual, without parallel, or specific resemblance, may be difficult to explain. And will any man tell me with a serious countenance, that an orderly universe must arise from some thought and art like the human, because we have experience of it? To ascertain this reasoning, it were requisite that we had experience of the origin of worlds; and it is not sufficient, surely, that we have seen ships and cities arise from human art and contrivance.

PHILO was proceeding in this vehement manner, somewhat between jest and earnest, as it appeared to me, when he observed some signs of impatience in CLEANTHES, and then immediately stopped short. What I had to suggest, said CLEANTHES, is only that you would not abuse terms, or make use of popular expressions to subvert philosophical reasonings. You know, that the vulgar often distinguish reason from experience, even where the question relates only to matter of fact and existence; though it is found, where that *reason* is properly analysed, that it is nothing but a species of experience. To prove by experience the origin of the universe from mind, is not more contrary to common speech, than to prove the motion of the earth from the same principle. And a caviller might raise all the same objections to the Copernican system, which you have urged against my

reasonings. Have you other earths, might he say, which you have seen to move? Have

Yes! cried PHILO, interrupting him, we have other earths. Is not the moon another earth, which we see to turn round its centre? Is not Venus another earth, where we observe the same phenomenon? Are not the revolutions of the sun also a confirmation, from analogy, of the same theory? All the planets, are they not earths, which revolve about the sun? Are not the satellites moons, which move round Jupiter and Saturn, and along with these primary planets round the sun? These analogies and resemblances, with others which I have not mentioned, are the sole proofs of the COPERNICAN system; and to you it belongs to consider, whether you have any analogies of the same kind to support your theory.

In reality, CLEANTHES, continued he, the modern system of astronomy is now so much received by all inquirers, and has become so essential a part even of our earliest education, that we are not commonly very scrupulous in examining the reasons upon which it is founded. It is now become a matter of mere curiosity to study the first writers on that subject, who had the full force of prejudice to encounter, and were obliged to turn their arguments on every side in order to render them popular and convincing. But if we peruse GALILEO's famous Dialogues concerning the system of the world, we shall find, that that great genius, one of the sublimest that ever existed, first bent all his endeavours to prove, that there was no foundation for the distinction commonly made between elementary and celestial substances. The schools, proceeding from the illusions of sense, had carried this distinction very far; and had established the latter substances to be ingenerable, incorruptible, unalterable, impassable; and had assigned all the opposite qualities to the former. But GALILEO, beginning with the moon, proved its similarity in every particular to the earth; its convex figure, its natural darkness when not illuminated, its density, its distinction into solid and liquid, the variations of its phases, the mutual illuminations of the earth and moon, their mutual eclipses, the inequalities of the lunar surface, &c. After many instances of this kind, with regard to all the planets, men plainly saw that these bodies became proper objects of experience; and that the similarity of their nature enabled us to extend the same arguments and phenomena from one to the other.

In this cautious proceeding of the astronomers, you may read your own condemnation, CLEANTHES; or rather may see, that the subject in which you are engaged exceeds all human reason and inquiry. Can you pretend to show any such similarity between the fabric of a house, and the generation of a universe? Have you ever seen nature in any such situation as resembles the first arrangement of the elements? Have worlds ever been formed under your eye; and have you had leisure to observe the whole progress of the phenomenon, from the first appearance of order to its final consummation? If you have, then cite your experience, and deliver your theory.

Dialogues Concerning Natural Religion

David Hume

1779

PART 3

How the most absurd argument, replied CLEANTHES, in the hands of a man of ingenuity and invention, may acquire an air of probability! Are you not aware, PHILO, that it became necessary for Copernicus and his first disciples to prove the similarity of the terrestrial and celestial matter; because several philosophers, blinded by old systems, and supported by some sensible appearances, had denied this similarity? but that it is by no means necessary, that Theists should prove the similarity of the works of Nature to those of Art; because this similarity is self-evident and undeniable? The same matter, a like form; what more is requisite to show an analogy between their causes, and to ascertain the origin of all things from a divine purpose and intention? Your objections, I must freely tell you, are no better than the abstruse cavils of those philosophers who denied motion; and ought to be refuted in the same manner, by illustrations, examples, and instances, rather than by serious argument and philosophy.

Suppose, therefore, that an articulate voice were heard in the clouds, much louder and more melodious than any which human art could ever reach: Suppose, that this voice were extended in the same instant over all nations, and spoke to each nation in its own language and dialect: Suppose, that the words delivered not only contain a just sense and meaning, but convey some instruction altogether worthy of a benevolent Being, superior to mankind: Could you possibly hesitate a moment concerning the cause of this voice? and must you not instantly ascribe it to some design or purpose? Yet I cannot see but all the same objections (if they merit that appellation) which lie against the system of Theism, may also be produced against this inference.

Might you not say, that all conclusions concerning fact were founded on experience: that when we

hear an articulate voice in the dark, and thence infer a man, it is only the resemblance of the effects which leads us to conclude that there is a like resemblance in the cause: but that this extraordinary voice, by its loudness, extent, and flexibility to all languages, bears so little analogy to any human voice, that we have no reason to suppose any analogy in their causes: and consequently, that a rational, wise, coherent speech proceeded, you know not whence, from some accidental whistling of the winds, not from any divine reason or intelligence? You see clearly your own objections in these cavils, and I hope too you see clearly, that they cannot possibly have more force in the one case than in the other.

But to bring the case still nearer the present one of the universe, I shall make two suppositions, which imply not any absurdity or impossibility. Suppose that there is a natural, universal, invariable language, common to every individual of human race; and that books are natural productions, which perpetuate themselves in the same manner with animals and vegetables, by descent and propagation. Several expressions of our passions contain a universal language: all brute animals have a natural speech, which, however limited, is very intelligible to their own species. And as there are infinitely fewer parts and less contrivance in the finest composition of eloquence, than in the coarsest organised body, the propagation of an *Iliad* or *Aeneid* is an easier supposition than that of any plant or animal.

Suppose, therefore, that you enter into your library, thus peopled by natural volumes, containing the most refined reason and most exquisite beauty; could you possibly open one of them, and doubt, that its original cause bore the strongest analogy to mind and intelligence? When it reasons and discourses; when it expostulates, argues, and enforces its views and topics; when it applies sometimes to the pure intellect, sometimes to the affections; when it collects, disposes, and adorns every consideration suited to the subject; could you persist in asserting, that all this, at the bottom, had really no meaning; and that the first formation of this volume in the loins of its original parent proceeded not from thought and design? Your obstinacy, I know, reaches not that degree of firmness: even your sceptical play and wantonness would be abashed at so glaring an absurdity.

But if there be any difference, PHILO, between this supposed case and the real one of the universe, it is all to the advantage of the latter. The anatomy of an animal affords many stronger instances of design than the perusal of LIVY or TACITUS; and any objection which you start in the former case, by carrying me back to so unusual and extraordinary a scene as the first formation of worlds, the same objection has place on the supposition of our vegetating library. Choose, then, your party, PHILO, without ambiguity or evasion; assert either that a rational volume is no proof of a rational cause, or admit of a similar cause to all the works of nature.

Let me here observe too, continued CLEANTHES, that this religious argument, instead of being weakened by that scepticism so much affected by you, rather acquires force from it, and becomes more firm and undisputed. To exclude all argument or reasoning of every kind, is either affectation or madness. The declared profession of every reasonable sceptic is only to reject abstruse, remote, and refined arguments; to adhere to common sense and the plain instincts of nature; and to assent, wherever any reasons strike him with so full a force that he cannot, without the greatest violence, prevent it. Now the arguments for Natural Religion are plainly of this kind; and nothing but the most perverse, obstinate metaphysics can reject them. Consider, anatomise the eye; survey its structure and contrivance; and tell me, from your own feeling, if the idea of a contriver does not immediately flow in upon you with a force like that of sensation. The most obvious conclusion, surely, is in favour of design; and it requires time, reflection, and study, to summon up those frivolous, though abstruse objections, which can support Infidelity. Who can

behold the male and female of each species, the correspondence of their parts and instincts, their passions, and whole course of life before and after generation, but must be sensible, that the propagation of the species is intended by Nature? Millions and millions of such instances present themselves through every part of the universe; and no language can convey a more intelligible irresistible meaning, than the curious adjustment of final causes. To what degree, therefore, of blind dogmatism must one have attained, to reject such natural and such convincing arguments?

Some beauties in writing we may meet with, which seem contrary to rules, and which gain the affections, and animate the imagination, in opposition to all the precepts of criticism, and to the authority of the established masters of art. And if the argument for Theism be, as you pretend, contradictory to the principles of logic; its universal, its irresistible influence proves clearly, that there may be arguments of a like irregular nature. Whatever cavils may be urged, an orderly world, as well as a coherent, articulate speech, will still be received as an incontestable proof of design and intention.

It sometimes happens, I own, that the religious arguments have not their due influence on an ignorant savage and barbarian; not because they are obscure and difficult, but because he never asks himself any question with regard to them. Whence arises the curious structure of an animal? From the copulation of its parents. And these whence? From their parents? A few removes set the objects at such a distance, that to him they are lost in darkness and confusion; nor is he actuated by any curiosity to trace them further. But this is neither dogmatism nor scepticism, but stupidity: a state of mind very different from your sifting, inquisitive disposition, my ingenious friend. You can trace causes from effects: You can compare the most distant and remote objects: and your greatest errors proceed not from barrenness of thought and invention, but from too luxuriant a fertility, which suppresses your natural good sense, by a profusion of unnecessary scruples and objections.

Here I could observe, HERMIPPUS, that PHILO was a little embarrassed and confounded: But while he hesitated in delivering an answer, luckily for him, DEMEA broke in upon the discourse, and saved his countenance.

Your instance, CLEANTHES, said he, drawn from books and language, being familiar, has, I confess, so much more force on that account: but is there not some danger too in this very circumstance; and may it not render us presumptuous, by making us imagine we comprehend the Deity, and have some adequate idea of his nature and attributes? When I read a volume, I enter into the mind and intention of the author: I become him, in a manner, for the instant; and have an immediate feeling and conception of those ideas which revolved in his imagination while employed in that composition. But so near an approach we never surely can make to the Deity. His ways are not our ways. His attributes are perfect, but incomprehensible. And this volume of nature contains a great and inexplicable riddle, more than any intelligible discourse or reasoning.

The ancient PLATONISTS, you know, were the most religious and devout of all the Pagan philosophers; yet many of them, particularly PLOTINUS, expressly declare, that intellect or understanding is not to be ascribed to the Deity; and that our most perfect worship of him consists, not in acts of veneration, reverence, gratitude, or love; but in a certain mysterious self-annihilation, or total extinction of all our faculties. These ideas are, perhaps, too far stretched; but still it must be acknowledged, that, by representing the Deity as so intelligible and comprehensible, and so similar to a human mind, we are guilty of the grossest and most narrow partiality, and make ourselves the model of the whole universe.

All the *sentiments* of the human mind, gratitude, resentment, love, friendship, approbation, blame, pity, emulation, envy, have a plain reference to the state and situation of man, and are calculated for preserving the existence and promoting the activity of such a being in such circumstances. It seems, therefore, unreasonable to transfer such sentiments to a supreme existence, or to suppose him actuated by them; and the phenomena besides of the universe will not support us in such a theory. All our *ideas,* derived from the senses, are confessedly false and illusive; and cannot therefore be supposed to have place in a supreme intelligence: And as the ideas of internal sentiment, added to those of the external senses, compose the whole furniture of human understanding, we may conclude, that none of the *materials* of thought are in any respect similar in the human and in the divine intelligence. Now, as to the *manner* of thinking; how can we make any comparison between them, or suppose them any wise resembling? Our thought is fluctuating, uncertain, fleeting, successive, and compounded; and were we to remove these circumstances, we absolutely annihilate its essence, and it would in such a case be an abuse of terms to apply to it the name of thought or reason. At least if it appear more pious and respectful (as it really is) still to retain these terms, when we mention the Supreme Being, we ought to acknowledge, that their meaning, in that case, is totally incomprehensible; and that the infirmities of our nature do not permit us to reach any ideas which in the least correspond to the ineffable sublimity of the Divine attributes.

Dialogues Concerning Natural Religion

David Hume

1779

PART 4

It seems strange to me, said CLEANTHES, that you, DEMEA, who are so sincere in the cause of religion, should still maintain the mysterious, incomprehensible nature of the Deity, and should insist so strenuously that he has no manner of likeness or resemblance to human creatures. The Deity, I can readily allow, possesses many powers and attributes of which we can have no comprehension: But if our ideas, so far as they go, be not just, and adequate, and correspondent to his real nature, I know not what there is in this subject worth insisting on. Is the name, without any meaning, of such mighty importance? Or how do you mystics, who maintain the absolute incomprehensibility of the Deity, differ from Sceptics or Atheists, who assert, that the first cause of all is unknown and unintelligible? Their temerity must be very great, if, after rejecting the production by a mind, I mean a mind resembling the human, (for I know of no other,) they pretend to assign, with certainty, any other specific intelligible cause: And their conscience must be very scrupulous indeed, if they refuse to call the universal unknown cause a God or Deity; and to bestow on him as many sublime eulogies and unmeaning epithets as you shall please to require of them.

Who could imagine, replied DEMEA, that CLEANTHES, the calm philosophical CLEANTHES, would attempt to refute his antagonists by affixing a nickname to them; and, like the common bigots and inquisitors of the age, have recourse to invective and declamation, instead of reasoning? Or does he not perceive, that these topics are easily retorted, and that *Anthropomorphite* is an appellation as invidious, and implies as dangerous consequences, as the epithet of *Mystic*, with which he has honoured us? In reality, CLEANTHES, consider what it is you assert when you represent the Deity as similar to a human mind and understanding. What is the soul of man? A composition of various

faculties, passions, sentiments, ideas; united, indeed, into one self or person, but still distinct from each other. When it reasons, the ideas, which are the parts of its discourse, arrange themselves in a certain form or order; which is not preserved entire for a moment, but immediately gives place to another arrangement. New opinions, new passions, new affections, new feelings arise, which continually diversify the mental scene, and produce in it the greatest variety and most rapid succession imaginable. How is this compatible with that perfect immutability and simplicity which all true Theists ascribe to the Deity? By the same act, say they, he sees past, present, and future: His love and hatred, his mercy and justice, are one individual operation: He is entire in every point of space; and complete in every instant of duration. No succession, no change, no acquisition, no diminution. What he is implies not in it any shadow of distinction or diversity. And what he is this moment he ever has been, and ever will be, without any new judgement, sentiment, or operation. He stands fixed in one simple, perfect state: nor can you ever say, with any propriety, that this act of his is different from that other; or that this judgement or idea has been lately formed, and will give place, by succession, to any different judgement or idea.

I can readily allow, said CLEANTHES, that those who maintain the perfect simplicity of the Supreme Being, to the extent in which you have explained it, are complete *Mystics*, and chargeable with all the consequences which I have drawn from their opinion. They are, in a word, Atheists, without knowing it. For though it be allowed, that the Deity possesses attributes of which we have no comprehension, yet ought we never to ascribe to him any attributes which are absolutely incompatible with that intelligent nature essential to him. A mind, whose acts and sentiments and ideas are not distinct and successive; one, that is wholly simple, and totally immutable, is a mind which has no thought, no reason, no will, no sentiment, no love, no hatred; or, in a word, is no mind at all. It is an abuse of terms to give it that appellation; and we may as well speak of limited extension without figure, or of number without composition.

Pray consider, said PHILO, whom you are at present inveighing against. You are honouring with the appellation of Atheist all the sound, orthodox divines, almost, who have treated of this subject; and you will at last be, yourself, found, according to your reckoning, the only sound Theist in the world. But if idolaters be Atheists, as, I think, may justly be asserted, and Christian Theologians the same, what becomes of the argument, so much celebrated, derived from the universal consent of mankind?

But because I know you are not much swayed by names and authorities, I shall endeavour to show you, a little more distinctly, the inconveniences of that Anthropomorphism, which you have embraced; and shall prove, that there is no ground to suppose a plan of the world to be formed in the Divine mind, consisting of distinct ideas, differently arranged, in the same manner as an architect forms in his head the plan of a house which he intends to execute.

It is not easy, I own, to see what is gained by this supposition, whether we judge of the matter by *Reason* or by *Experience*. We are still obliged to mount higher, in order to find the cause of this cause, which you had assigned as satisfactory and conclusive.

If *Reason* (I mean abstract reason, derived from inquiries *a priori*) be not alike mute with regard to all questions concerning cause and effect, this sentence at least it will venture to pronounce, That a mental world, or universe of ideas, requires a cause as much, as does a material world, or universe of objects; and, if similar in its arrangement, must require a similar cause. For what is there in this subject, which should occasion a different conclusion or inference? In an abstract view, they are entirely alike; and no difficulty attends the one supposition, which is not common to both of them.

Again, when we will needs force *Experience* to pronounce some sentence, even on these subjects which lie beyond her sphere, neither can she perceive any material difference in this particular, between these two kinds of worlds; but finds them to be governed by similar principles, and to depend upon an equal variety of causes in their operations. We have specimens in miniature of both of them. Our own mind resembles the one; a vegetable or animal body the other. Let experience, therefore, judge from these samples. Nothing seems more delicate, with regard to its causes, than thought; and as these causes never operate in two persons after the same manner, so we never find two persons who think exactly alike. Nor indeed does the same person think exactly alike at any two different periods of time. A difference of age, of the disposition of his body, of weather, of food, of company, of books, of passions; any of these particulars, or others more minute, are sufficient to alter the curious machinery of thought, and communicate to it very different movements and operations. As far as we can judge, vegetables and animal bodies are not more delicate in their motions, nor depend upon a greater variety or more curious adjustment of springs and principles.

How, therefore, shall we satisfy ourselves concerning the cause of that Being whom you suppose the Author of Nature, or, according to your system of Anthropomorphism, the ideal world, into which you trace the material? Have we not the same reason to trace that ideal world into another ideal world, or new intelligent principle? But if we stop, and go no further; why go so far? why not stop at the material world? How can we satisfy ourselves without going on *in infinitum*? And, after all, what satisfaction is there in that infinite progression? Let us remember the story of the Indian philosopher and his elephant. It was never more applicable than to the present subject. If the material world rests upon a similar ideal world, this ideal world must rest upon some other; and so on, without end. It were better, therefore, never to look beyond the present material world. By supposing it to contain the principle of its order within itself, we really assert it to be God; and the sooner we arrive at that Divine Being, so much the better. When you go one step beyond the mundane system, you only excite an inquisitive humour which it is impossible ever to satisfy.

To say, that the different ideas which compose the reason of the Supreme Being, fall into order of themselves, and by their own nature, is really to talk without any precise meaning. If it has a meaning, I would fain know, why it is not as good sense to say, that the parts of the material world fall into order of themselves and by their own nature. Can the one opinion be intelligible, while the other is not so?

We have, indeed, experience of ideas which fall into order of themselves, and without any *known* cause. But, I am sure, we have a much larger experience of matter which does the same; as, in all instances of generation and vegetation, where the accurate analysis of the cause exceeds all human comprehension. We have also experience of particular systems of thought and of matter which have no order; of the first in madness, of the second in corruption. Why, then, should we think, that order is more essential to one than the other? And if it requires a cause in both, what do we gain by your system, in tracing the universe of objects into a similar universe of ideas? The first step which we make leads us on for ever. It were, therefore, wise in us to limit all our inquiries to the present world, without looking further. No satisfaction can ever be attained by these speculations, which so far exceed the narrow bounds of human understanding.

It was usual with the PERIPATETICS, you know, CLEANTHES, when the cause of any phenomenon was demanded, to have recourse to their *faculties* or *occult qualities*; and to say, for instance, that bread nourished by its nutritive faculty, and senna[19] purged by its purgative. But it has been

discovered, that this subterfuge was nothing but the disguise of ignorance; and that these philosophers, though less ingenuous, really said the same thing with the sceptics or the vulgar, who fairly confessed that they knew not the cause of these phenomena. In like manner, when it is asked, what cause produces order in the ideas of the Supreme Being; can any other reason be assigned by you, Anthropomorphites, than that it is a *rational* faculty, and that such is the nature of the Deity? But why a similar answer will not be equally satisfactory in accounting for the order of the world, without having recourse to any such intelligent creator as you insist on, may be difficult to determine. It is only to say, that *such* is the nature of material objects, and that they are all originally possessed of a *faculty* of order and proportion. These are only more learned and elaborate ways of confessing our ignorance; nor has the one hypothesis any real advantage above the other, except in its greater conformity to vulgar prejudices.

You have displayed this argument with great emphasis, replied CLEANTHES: You seem not sensible how easy it is to answer it. Even in common life, if I assign a cause for any event, is it any objection, PHILO, that I cannot assign the cause of that cause, and answer every new question which may incessantly be started? And what philosophers could possibly submit to so rigid a rule? philosophers, who confess ultimate causes to be totally unknown; and are sensible, that the most refined principles into which they trace the phenomena, are still to them as inexplicable as these phenomena themselves are to the vulgar. The order and arrangement of nature, the curious adjustment of final causes, the plain use and intention of every part and organ; all these bespeak in the clearest language an intelligent cause or author. The heavens and the earth join in the same testimony: The whole chorus of Nature raises one hymn to the praises of its Creator. You alone, or almost alone, disturb this general harmony. You start abstruse doubts, cavils, and objections: You ask me, what is the cause of this cause? I know not; I care not; that concerns not me. I have found a Deity; and here I stop my inquiry. Let those go further, who are wiser or more enterprising.

I pretend to be neither, replied PHILO: And for that very reason, I should never perhaps have attempted to go so far; especially when I am sensible, that I must at last be contented to sit down with the same answer, which, without further trouble, might have satisfied me from the beginning. If I am still to remain in utter ignorance of causes, and can absolutely give an explication of nothing, I shall never esteem it any advantage to shove off for a moment a difficulty, which, you acknowledge, must immediately, in its full force, recur upon me. Naturalists indeed very justly explain particular effects by more general causes, though these general causes themselves should remain in the end totally inexplicable; but they never surely thought it satisfactory to explain a particular effect by a particular cause, which was no more to be accounted for than the effect itself. An ideal system, arranged of itself, without a precedent design, is not a whit more explicable than a material one, which attains its order in a like manner; nor is there any more difficulty in the latter supposition than in the former.

Dialogues Concerning Natural Religion

David Hume

1779

PART 5

But to show you still more inconveniences, continued PHILO, in your Anthropomorphism, please to take a new survey of your principles. *Like effects prove like causes*. This is the experimental argument; and this, you say too, is the sole theological argument. Now, it is certain, that the liker the effects are which are seen, and the liker the causes which are inferred, the stronger is the argument. Every departure on either side diminishes the probability, and renders the experiment less conclusive. You cannot doubt of the principle; neither ought you to reject its consequences.

All the new discoveries in astronomy, which prove the immense grandeur and magnificence of the works of Nature, are so many additional arguments for a Deity, according to the true system of Theism; but, according to your hypothesis of experimental Theism, they become so many objections, by removing the effect still further from all resemblance to the effects of human art and contrivance. For, if LUCRETIUS, even following the old system of the world, could exclaim,

> *Quis regere immensi summam, quis habere profundi*
> *Indu manu validas potis est moderanter habenas?*
> *Quis pariter coelos omnes convertere? et omnes*
> *Ignibus aetheriis terras suffire feraces?*
> *Omnibus inque locis esse omni tempore praesto?*[20]

If TULLY esteemed this reasoning so natural, as to put it into the mouth of his EPICUREAN:

> "*Quibus enim oculis animi intueri potuit vester Plato fabricam illam tanti operis, qua construi a Deo atque aedificari mundum facit? quae molitio? quae ferramenta? qui*

> *vectes? quae machinae? qui ministri tanti muneris fuerunt? quemadmodum autem obedire et parere voluntati architecti aer, ignis, aqua, terra potuerunt?"*[21]

If this argument, I say, had any force in former ages, how much greater must it have at present, when the bounds of Nature are so infinitely enlarged, and such a magnificent scene is opened to us? It is still more unreasonable to form our idea of so unlimited a cause from our experience of the narrow productions of human design and invention.

The discoveries by microscopes, as they open a new universe in miniature, are still objections, according to you, arguments, according to me. The further we push our researches of this kind, we are still led to infer the universal cause of all to be vastly different from mankind, or from any object of human experience and observation.

And what say you to the discoveries in anatomy, chemistry, botany? These surely are no objections, replied CLEANTHES; they only discover new instances of art and contrivance. It is still the image of mind reflected on us from innumerable objects. Add, a mind *like the human*, said PHILO. I know of no other, replied CLEANTHES. And the liker the better, insisted PHILO. To be sure, said CLEANTHES .

Now, CLEANTHES, said PHILO, with an air of alacrity and triumph, mark the consequences. *First*, By this method of reasoning, you renounce all claim to infinity in any of the attributes of the Deity. For, as the cause ought only to be proportioned to the effect, and the effect, so far as it falls under our cognisance, is not infinite; what pretensions have we, upon your suppositions, to ascribe that attribute to the Divine Being? You will still insist, that, by removing him so much from all similarity to human creatures, we give in to the most arbitrary hypothesis, and at the same time weaken all proofs of his existence.

Secondly, You have no reason, on your theory, for ascribing perfection to the Deity, even in his finite capacity, or for supposing him free from every error, mistake, or incoherence, in his undertakings. There are many inexplicable difficulties in the works of Nature, which, if we allow a perfect author to be proved *a priori*, are easily solved, and become only seeming difficulties, from the narrow capacity of man, who cannot trace infinite relations. But according to your method of reasoning, these difficulties become all real; and perhaps will be insisted on, as new instances of likeness to human art and contrivance. At least, you must acknowledge, that it is impossible for us to tell, from our limited views, whether this system contains any great faults, or deserves any considerable praise, if compared to other possible, and even real systems. Could a peasant, if the *Aeneid* were read to him, pronounce that poem to be absolutely faultless, or even assign to it its proper rank among the productions of human wit, he, who had never seen any other production?

But were this world ever so perfect a production, it must still remain uncertain, whether all the excellences of the work can justly be ascribed to the workman. If we survey a ship, what an exalted idea must we form of the ingenuity of the carpenter who framed so complicated, useful, and beautiful a machine? And what surprise must we feel, when we find him a stupid mechanic, who imitated others, and copied an art, which, through a long succession of ages, after multiplied trials, mistakes, corrections, deliberations, and controversies, had been gradually improving? Many worlds might have been botched and bungled, throughout an eternity, ere this system was struck out; much labour lost, many fruitless trials made; and a slow, but continued improvement carried on during infinite ages in the art of world-making. In such subjects, who can determine, where the truth; nay, who can conjecture where the probability lies, amidst a great number of hypotheses which may be proposed, and a still greater which may be imagined?

And what shadow of an argument, continued PHILO, can you produce, from your hypothesis, to prove the unity of the Deity? A great number of men join in building a house or ship, in rearing a city, in framing a commonwealth; why may not several deities combine in contriving and framing a world? This is only so much greater similarity to human affairs. By sharing the work among several, we may so much further limit the attributes of each, and get rid of that extensive power and knowledge, which must be supposed in one deity, and which, according to you, can only serve to weaken the proof of his existence. And if such foolish, such vicious creatures as man, can yet often unite in framing and executing one plan, how much more those deities or demons, whom we may suppose several degrees more perfect!

To multiply causes without necessity, is indeed contrary to true philosophy: but this principle applies not to the present case. Were one deity antecedently proved by your theory, who were possessed of every attribute requisite to the production of the universe; it would be needless, I own, (though not absurd,) to suppose any other deity existent. But while it is still a question, Whether all these attributes are united in one subject, or dispersed among several independent beings, by what phenomena in nature can we pretend to decide the controversy? Where we see a body raised in a scale, we are sure that there is in the opposite scale, however concealed from sight, some counterpoising weight equal to it; but it is still allowed to doubt, whether that weight be an aggregate of several distinct bodies, or one uniform united mass. And if the weight requisite very much exceeds any thing which we have ever seen conjoined in any single body, the former supposition becomes still more probable and natural. An intelligent being of such vast power and capacity as is necessary to produce the universe, or, to speak in the language of ancient philosophy, so prodigious an animal exceeds all analogy, and even comprehension.

But further, CLEANTHES: men are mortal, and renew their species by generation; and this is common to all living creatures. The two great sexes of male and female, says MILTON, animate the world. Why must this circumstance, so universal, so essential, be excluded from those numerous and limited deities? Behold, then, the theogony of ancient times brought back upon us.

And why not become a perfect Anthropomorphite? Why not assert the deity or deities to be corporeal, and to have eyes, a nose, mouth, ears, &c.? EPICURUS maintained, that no man had ever seen reason but in a human figure; therefore the gods must have a human figure. And this argument, which is deservedly so much ridiculed by CICERO, becomes, according to you, solid and philosophical.

In a word, CLEANTHES, a man who follows your hypothesis is able perhaps to assert, or conjecture, that the universe, sometime, arose from something like design: but beyond that position he cannot ascertain one single circumstance; and is left afterwards to fix every point of his theology by the utmost license of fancy and hypothesis. This world, for aught he knows, is very faulty and imperfect, compared to a superior standard; and was only the first rude essay of some infant deity, who afterwards abandoned it, ashamed of his lame performance: it is the work only of some dependent, inferior deity; and is the object of derision to his superiors: it is the production of old age and dotage in some superannuated deity; and ever since his death, has run on at adventures, from the first impulse and active force which it received from him. You justly give signs of horror, DEMEA, at these strange suppositions; but these, and a thousand more of the same kind, are CLEANTHES's suppositions, not mine. From the moment the attributes of the Deity are supposed finite, all these have place. And I cannot, for my part, think that so wild and unsettled a system of theology is, in any respect, preferable to none at all.

These suppositions I absolutely disown, cried CLEANTHES: they strike me, however, with no horror, especially when proposed in that rambling way in which they drop from you. On the contrary, they give me pleasure, when I see, that, by the utmost indulgence of your imagination, you never get rid of the hypothesis of design in the universe, but are obliged at every turn to have recourse to it. To this concession I adhere steadily; and this I regard as a sufficient foundation for religion.

Dialogues Concerning Natural Religion

David Hume

1779

PART 6

It must be a slight fabric, indeed, said DEMEA, which can be erected on so tottering a foundation. While we are uncertain whether there is one deity or many; whether the deity or deities, to whom we owe our existence, be perfect or imperfect, subordinate or supreme, dead or alive, what trust or confidence can we repose in them? What devotion or worship address to them? What veneration or obedience pay them? To all the purposes of life the theory of religion becomes altogether useless: and even with regard to speculative consequences, its uncertainty, according to you, must render it totally precarious and unsatisfactory.

To render it still more unsatisfactory, said PHILO, there occurs to me another hypothesis, which must acquire an air of probability from the method of reasoning so much insisted on by CLEANTHES. That like effects arise from like causes: this principle he supposes the foundation of all religion. But there is another principle of the same kind, no less certain, and derived from the same source of experience; that where several known circumstances are *observed* to be similar, the unknown will also be *found* similar. Thus, if we see the limbs of a human body, we conclude that it is also attended with a human head, though hid from us. Thus, if we see, through a chink in a wall, a small part of the sun, we conclude, that, were the wall removed, we should see the whole body. In short, this method of reasoning is so obvious and familiar, that no scruple can ever be made with regard to its solidity.

Now, if we survey the universe, so far as it falls under our knowledge, it bears a great resemblance to an animal or organised body, and seems actuated with a like principle of life and motion. A continual circulation of matter in it produces no disorder: a continual waste in every part is

incessantly repaired: the closest sympathy is perceived throughout the entire system: and each part or member, in performing its proper offices, operates both to its own preservation and to that of the whole. The world, therefore, I infer, is an animal; and the Deity is the SOUL of the world, actuating it, and actuated by it.

You have too much learning, CLEANTHES, to be at all surprised at this opinion, which, you know, was maintained by almost all the Theists of antiquity, and chiefly prevails in their discourses and reasonings. For though, sometimes, the ancient philosophers reason from final causes, as if they thought the world the workmanship of God; yet it appears rather their favourite notion to consider it as his body, whose organisation renders it subservient to him. And it must be confessed, that, as the universe resembles more a human body than it does the works of human art and contrivance, if our limited analogy could ever, with any propriety, be extended to the whole of nature, the inference seems juster in favour of the ancient than the modern theory.

There are many other advantages, too, in the former theory, which recommended it to the ancient theologians. Nothing more repugnant to all their notions, because nothing more repugnant to common experience, than mind without body; a mere spiritual substance, which fell not under their senses nor comprehension, and of which they had not observed one single instance throughout all nature. Mind and body they knew, because they felt both: an order, arrangement, organisation, or internal machinery, in both, they likewise knew, after the same manner: and it could not but seem reasonable to transfer this experience to the universe; and to suppose the divine mind and body to be also coeval, and to have, both of them, order and arrangement naturally inherent in them, and inseparable from them.

Here, therefore, is a new species of Anthropomorphism, CLEANTHES, on which you may deliberate; and a theory which seems not liable to any considerable difficulties. You are too much superior, surely, to *systematical prejudices*, to find any more difficulty in supposing an animal body to be, originally, of itself, or from unknown causes, possessed of order and organisation, than in supposing a similar order to belong to mind. But the *vulgar prejudice*, that body and mind ought always to accompany each other, ought not, one should think, to be entirely neglected; since it is founded on *vulgar experience*, the only guide which you profess to follow in all these theological inquiries. And if you assert, that our limited experience is an unequal standard, by which to judge of the unlimited extent of nature; you entirely abandon your own hypothesis, and must thenceforward adopt our Mysticism, as you call it, and admit of the absolute incomprehensibility of the Divine Nature.

This theory, I own, replied CLEANTHES, has never before occurred to me, though a pretty natural one; and I cannot readily, upon so short an examination and reflection, deliver any opinion with regard to it. You are very scrupulous, indeed, said PHILO: were I to examine any system of yours, I should not have acted with half that caution and reserve, in starting objections and difficulties to it. However, if any thing occur to you, you will oblige us by proposing it.

Why then, replied CLEANTHES, it seems to me, that, though the world does, in many circumstances, resemble an animal body; yet is the analogy also defective in many circumstances the most material: no organs of sense; no seat of thought or reason; no one precise origin of motion and action. In short, it seems to bear a stronger resemblance to a vegetable than to an animal, and your inference would be so far inconclusive in favour of the soul of the world.

But, in the next place, your theory seems to imply the eternity of the world; and that is a principle, which, I think, can be refuted by the strongest reasons and probabilities. I shall suggest an

argument to this purpose, which, I believe, has not been insisted on by any writer. Those, who reason from the late origin of arts and sciences, though their inference wants not force, may perhaps be refuted by considerations derived from the nature of human society, which is in continual revolution, between ignorance and knowledge, liberty and slavery, riches and poverty; so that it is impossible for us, from our limited experience, to foretell with assurance what events may or may not be expected. Ancient learning and history seem to have been in great danger of entirely perishing after the inundation of the barbarous nations; and had these convulsions continued a little longer, or been a little more violent, we should not probably have now known what passed in the world a few centuries before us. Nay, were it not for the superstition of the Popes, who preserved a little jargon of Latin, in order to support the appearance of an ancient and universal church, that tongue must have been utterly lost; in which case, the Western world, being totally barbarous, would not have been in a fit disposition for receiving the GREEK language and learning, which was conveyed to them after the sacking of CONSTANTINOPLE. When learning and books had been extinguished, even the mechanical arts would have fallen considerably to decay; and it is easily imagined, that fable or tradition might ascribe to them a much later origin than the true one. This vulgar argument, therefore, against the eternity of the world, seems a little precarious.

But here appears to be the foundation of a better argument. LUCULLUS was the first that brought cherry-trees from ASIA to EUROPE; though that tree thrives so well in many EUROPEAN climates, that it grows in the woods without any culture. Is it possible, that throughout a whole eternity, no EUROPEAN had ever passed into ASIA, and thought of transplanting so delicious a fruit into his own country? Or if the tree was once transplanted and propagated, how could it ever afterwards perish? Empires may rise and fall, liberty and slavery succeed alternately, ignorance and knowledge give place to each other; but the cherry-tree will still remain in the woods of GREECE, SPAIN, and ITALY, and will never be affected by the revolutions of human society.

It is not two thousand years since vines were transplanted into FRANCE, though there is no climate in the world more favourable to them. It is not three centuries since horses, cows, sheep, swine, dogs, corn, were known in AMERICA. Is it possible, that during the revolutions of a whole eternity, there never arose a COLUMBUS, who might open the communication between EUROPE and that continent? We may as well imagine, that all men would wear stockings for ten thousand years, and never have the sense to think of garters to tie them. All these seem convincing proofs of the youth, or rather infancy, of the world; as being founded on the operation of principles more constant and steady than those by which human society is governed and directed. Nothing less than a total convulsion of the elements will ever destroy all the EUROPEAN animals and vegetables which are now to be found in the Western world.

And what argument have you against such convulsions? replied PHILO. Strong and almost incontestable proofs may be traced over the whole earth, that every part of this globe has continued for many ages entirely covered with water. And though order were supposed inseparable from matter, and inherent in it; yet may matter be susceptible of many and great revolutions, through the endless periods of eternal duration. The incessant changes, to which every part of it is subject, seem to intimate some such general transformations; though, at the same time, it is observable, that all the changes and corruptions of which we have ever had experience, are but passages from one state of order to another; nor can matter ever rest in total deformity and confusion. What we see in the parts, we may infer in the whole; at least, that is the method of reasoning on which you rest your whole theory. And were I obliged to defend any particular

system of this nature, which I never willingly should do, I esteem none more plausible than that which ascribes an eternal inherent principle of order to the world, though attended with great and continual revolutions and alterations. This at once solves all difficulties; and if the solution, by being so general, is not entirely complete and satisfactory, it is at least a theory that we must sooner or later have recourse to, whatever system we embrace. How could things have been as they are, were there not an original inherent principle of order somewhere, in thought or in matter? And it is very indifferent to which of these we give the preference. Chance has no place, on any hypothesis, sceptical or religious. Every thing is surely governed by steady, inviolable laws. And were the inmost essence of things laid open to us, we should then discover a scene, of which, at present, we can have no idea. Instead of admiring the order of natural beings, we should clearly see that it was absolutely impossible for them, in the smallest article, ever to admit of any other disposition.

Were any one inclined to revive the ancient Pagan Theology, which maintained, as we learn from HESIOD, that this globe was governed by 30,000 deities, who arose from the unknown powers of nature: you would naturally object, CLEANTHES, that nothing is gained by this hypothesis; and that it is as easy to suppose all men animals, beings more numerous, but less perfect, to have sprung immediately from a like origin. Push the same inference a step further, and you will find a numerous society of deities as explicable as one universal deity, who possesses within himself the powers and perfections of the whole society. All these systems, then, of Scepticism, Polytheism, and Theism, you must allow, on your principles, to be on a like footing, and that no one of them has any advantage over the others. You may thence learn the fallacy of your principles.

Dialogues Concerning Natural Religion

David Hume

1779

PART 7

But here, continued PHILO, in examining the ancient system of the soul of the world, there strikes me, all on a sudden, a new idea, which, if just, must go near to subvert all your reasoning, and destroy even your first inferences, on which you repose such confidence. If the universe bears a greater likeness to animal bodies and to vegetables, than to the works of human art, it is more probable that its cause resembles the cause of the former than that of the latter, and its origin ought rather to be ascribed to generation or vegetation, than to reason or design. Your conclusion, even according to your own principles, is therefore lame and defective.

Pray open up this argument a little further, said DEMEA, for I do not rightly apprehend it in that concise manner in which you have expressed it.

Our friend CLEANTHES, replied PHILO, as you have heard, asserts, that since no question of fact can be proved otherwise than by experience, the existence of a Deity admits not of proof from any other medium. The world, says he, resembles the works of human contrivance; therefore its cause must also resemble that of the other. Here we may remark, that the operation of one very small part of nature, to wit man, upon another very small part, to wit that inanimate matter lying within his reach, is the rule by which CLEANTHES judges of the origin of the whole; and he measures objects, so widely disproportioned, by the same individual standard. But to waive all objections drawn from this topic, I affirm, that there are other parts of the universe (besides the machines of human invention) which bear still a greater resemblance to the fabric of the world, and which, therefore, afford a better conjecture concerning the universal origin of this system. These parts are animals and vegetables. The world plainly resembles more an animal or a vegetable, than it does a

watch or a knitting-loom. Its cause, therefore, it is more probable, resembles the cause of the former. The cause of the former is generation or vegetation. The cause, therefore, of the world, we may infer to be something similar or analogous to generation or vegetation.

But how is it conceivable, said DEMEA, that the world can arise from any thing similar to vegetation or generation?

Very easily, replied PHILO. In like manner as a tree sheds its seed into the neighbouring fields, and produces other trees; so the great vegetable, the world, or this planetary system, produces within itself certain seeds, which, being scattered into the surrounding chaos, vegetate into new worlds. A comet, for instance, is the seed of a world; and after it has been fully ripened, by passing from sun to sun, and star to star, it is at last tossed into the unformed elements which every where surround this universe, and immediately sprouts up into a new system.

Or if, for the sake of variety (for I see no other advantage), we should suppose this world to be an animal; a comet is the egg of this animal: and in like manner as an ostrich lays its egg in the sand, which, without any further care, hatches the egg, and produces a new animal; so....

I understand you, says DEMEA: But what wild, arbitrary suppositions are these! What *data* have you for such extraordinary conclusions? And is the slight, imaginary resemblance of the world to a vegetable or an animal sufficient to establish the same inference with regard to both? Objects, which are in general so widely different, ought they to be a standard for each other?

Right, cries PHILO: This is the topic on which I have all along insisted. I have still asserted, that we have no data to establish any system of cosmogony. Our experience, so imperfect in itself, and so limited both in extent and duration, can afford us no probable conjecture concerning the whole of things. But if we must needs fix on some hypothesis; by what rule, pray, ought we to determine our choice? Is there any other rule than the greater similarity of the objects compared? And does not a plant or an animal, which springs from vegetation or generation, bear a stronger resemblance to the world, than does any artificial machine, which arises from reason and design?

But what is this vegetation and generation of which you talk? said DEMEA. Can you explain their operations, and anatomise that fine internal structure on which they depend?

As much, at least, replied PHILO, as CLEANTHES can explain the operations of reason, or anatomise that internal structure on which it depends. But without any such elaborate disquisitions, when I see an animal, I infer, that it sprang from generation; and that with as great certainty as you conclude a house to have been reared by design. These words, *generation*, *reason*, mark only certain powers and energies in nature, whose effects are known, but whose essence is incomprehensible; and one of these principles, more than the other, has no privilege for being made a standard to the whole of nature.

In reality, DEMEA, it may reasonably be expected, that the larger the views are which we take of things, the better will they conduct us in our conclusions concerning such extraordinary and such magnificent subjects. In this little corner of the world alone, there are four principles, *reason, instinct, generation, vegetation,* which are similar to each other, and are the causes of similar effects. What a number of other principles may we naturally suppose in the immense extent and variety of the universe, could we travel from planet to planet, and from system to system, in order to examine each part of this mighty fabric? Any one of these four principles above mentioned, (and a hundred others which lie open to our conjecture,) may afford us a theory by which to judge of the origin of the world; and it is a palpable and egregious partiality to confine our view entirely to that principle by which our own minds operate. Were this principle more intelligible on that

account, such a partiality might be somewhat excusable: But reason, in its internal fabric and structure, is really as little known to us as instinct or vegetation; and, perhaps, even that vague, indeterminate word, Nature, to which the vulgar refer every thing, is not at the bottom more inexplicable. The effects of these principles are all known to us from experience; but the principles themselves, and their manner of operation, are totally unknown; nor is it less intelligible, or less conformable to experience, to say, that the world arose by vegetation, from a seed shed by another world, than to say that it arose from a divine reason or contrivance, according to the sense in which CLEANTHES understands it.

But methinks, said DEMEA, if the world had a vegetative quality, and could sow the seeds of new worlds into the infinite chaos, this power would be still an additional argument for design in its author. For whence could arise so wonderful a faculty but from design? Or how can order spring from any thing which perceives not that order which it bestows?

You need only look around you, replied PHILO, to satisfy yourself with regard to this question. A tree bestows order and organisation on that tree which springs from it, without knowing the order; an animal in the same manner on its offspring; a bird on its nest; and instances of this kind are even more frequent in the world than those of order, which arise from reason and contrivance. To say, that all this order in animals and vegetables proceeds ultimately from design, is begging the question; nor can that great point be ascertained otherwise than by proving, *a priori*, both that order is, from its nature, inseparably attached to thought; and that it can never of itself, or from original unknown principles, belong to matter.

But further, DEMEA; this objection which you urge can never be made use of by CLEANTHES, without renouncing a defence which he has already made against one of my objections. When I inquired concerning the cause of that supreme reason and intelligence into which he resolves every thing; he told me, that the impossibility of satisfying such inquiries could never be admitted as an objection in any species of philosophy. *We must stop somewhere*, says he; *nor is it ever within the reach of human capacity to explain ultimate causes, or show the last connections of any objects. It is sufficient, if any steps, so far as we go, are supported by experience and observation*. Now, that vegetation and generation, as well as reason, are experienced to be principles of order in nature, is undeniable. If I rest my system of cosmogony on the former, preferably to the latter, it is at my choice. The matter seems entirely arbitrary. And when CLEANTHES asks me what is the cause of my great vegetative or generative faculty, I am equally entitled to ask him the cause of his great reasoning principle. These questions we have agreed to forbear on both sides; and it is chiefly his interest on the present occasion to stick to this agreement. Judging by our limited and imperfect experience, generation has some privileges above reason: for we see every day the latter arise from the former, never the former from the latter.

Compare, I beseech you, the consequences on both sides. The world, say I, resembles an animal; therefore it is an animal, therefore it arose from generation. The steps, I confess, are wide; yet there is some small appearance of analogy in each step. The world, says CLEANTHES, resembles a machine; therefore it is a machine, therefore it arose from design. The steps are here equally wide, and the analogy less striking. And if he pretends to carry on *my* hypothesis a step further, and to infer design or reason from the great principle of generation, on which I insist; I may, with better authority, use the same freedom to push further *his* hypothesis, and infer a divine generation or theogony from his principle of reason. I have at least some faint shadow of experience, which is the utmost that can ever be attained in the present subject. Reason, in innumerable instances, is observed to arise from the principle of generation, and never to arise from any other principle.

HESIOD, and all the ancient mythologists, were so struck with this analogy, that they universally explained the origin of nature from an animal birth, and copulation. PLATO too, so far as he is intelligible, seems to have adopted some such notion in his TIMAEUS.

The BRAHMINS assert, that the world arose from an infinite spider, who spun this whole complicated mass from his bowels, and annihilates afterwards the whole or any part of it, by absorbing it again, and resolving it into his own essence. Here is a species of cosmogony, which appears to us ridiculous; because a spider is a little contemptible animal, whose operations we are never likely to take for a model of the whole universe. But still here is a new species of analogy, even in our globe. And were there a planet wholly inhabited by spiders, (which is very possible,) this inference would there appear as natural and irrefragable as that which in our planet ascribes the origin of all things to design and intelligence, as explained by CLEANTHES. Why an orderly system may not be spun from the belly as well as from the brain, it will be difficult for him to give a satisfactory reason.

I must confess, PHILO, replied CLEANTHES, that of all men living, the task which you have undertaken, of raising doubts and objections, suits you best, and seems, in a manner, natural and unavoidable to you. So great is your fertility of invention, that I am not ashamed to acknowledge myself unable, on a sudden, to solve regularly such out-of-the-way difficulties as you incessantly start upon me: though I clearly see, in general, their fallacy and error. And I question not, but you are yourself, at present, in the same case, and have not the solution so ready as the objection: while you must be sensible, that common sense and reason are entirely against you; and that such whimsies as you have delivered, may puzzle, but never can convince us.

Dialogues Concerning Natural Religion

David Hume

1779

PART 8

What you ascribe to the fertility of my invention, replied PHILO, is entirely owing to the nature of the subject. In subjects adapted to the narrow compass of human reason, there is commonly but one determination, which carries probability or conviction with it; and to a man of sound judgement, all other suppositions, but that one, appear entirely absurd and chimerical. But in such questions as the present, a hundred contradictory views may preserve a kind of imperfect analogy; and invention has here full scope to exert itself. Without any great effort of thought, I believe that I could, in an instant, propose other systems of cosmogony, which would have some faint appearance of truth, though it is a thousand, a million to one, if either yours or any one of mine be the true system.

For instance, what if I should revive the old EPICUREAN hypothesis? This is commonly, and I believe justly, esteemed the most absurd system that has yet been proposed; yet I know not whether, with a few alterations, it might not be brought to bear a faint appearance of probability. Instead of supposing matter infinite, as EPICURUS did, let us suppose it finite. A finite number of particles is only susceptible of finite transpositions: and it must happen, in an eternal duration, that every possible order or position must be tried an infinite number of times. This world, therefore, with all its events, even the most minute, has before been produced and destroyed, and will again be produced and destroyed, without any bounds and limitations. No one, who has a conception of the powers of infinite, in comparison of finite, will ever scruple this determination.

But this supposes, said DEMEA, that matter can acquire motion, without any voluntary agent or first mover.

And where is the difficulty, replied PHILO, of that supposition? Every event, before experience, is equally difficult and incomprehensible; and every event, after experience, is equally easy and intelligible. Motion, in many instances, from gravity, from elasticity, from electricity, begins in matter, without any known voluntary agent: and to suppose always, in these cases, an unknown voluntary agent, is mere hypothesis; and hypothesis attended with no advantages. The beginning of motion in matter itself is as conceivable *a priori* as its communication from mind and intelligence.

Besides, why may not motion have been propagated by impulse through all eternity, and the same stock of it, or nearly the same, be still upheld in the universe? As much is lost by the composition of motion, as much is gained by its resolution. And whatever the causes are, the fact is certain, that matter is, and always has been, in continual agitation, as far as human experience or tradition reaches. There is not probably, at present, in the whole universe, one particle of matter at absolute rest.

And this very consideration too, continued PHILO, which we have stumbled on in the course of the argument, suggests a new hypothesis of cosmogony, that is not absolutely absurd and improbable. Is there a system, an order, an economy of things, by which matter can preserve that perpetual agitation which seems essential to it, and yet maintain a constancy in the forms which it produces? There certainly is such an economy; for this is actually the case with the present world. The continual motion of matter, therefore, in less than infinite transpositions, must produce this economy or order; and by its very nature, that order, when once established, supports itself, for many ages, if not to eternity. But wherever matter is so poised, arranged, and adjusted, as to continue in perpetual motion, and yet preserve a constancy in the forms, its situation must, of necessity, have all the same appearance of art and contrivance which we observe at present. All the parts of each form must have a relation to each other, and to the whole; and the whole itself must have a relation to the other parts of the universe; to the element in which the form subsists; to the materials with which it repairs its waste and decay; and to every other form which is hostile or friendly. A defect in any of these particulars destroys the form; and the matter of which it is composed is again set loose, and is thrown into irregular motions and fermentations, till it unite itself to some other regular form. If no such form be prepared to receive it, and if there be a great quantity of this corrupted matter in the universe, the universe itself is entirely disordered; whether it be the feeble embryo of a world in its first beginnings that is thus destroyed, or the rotten carcass of one languishing in old age and infirmity. In either case, a chaos ensues; till finite, though innumerable revolutions produce at last some forms, whose parts and organs are so adjusted as to support the forms amidst a continued succession of matter.

Suppose (for we shall endeavour to vary the expression), that matter were thrown into any position, by a blind, unguided force; it is evident that this first position must, in all probability, be the most confused and most disorderly imaginable, without any resemblance to those works of human contrivance, which, along with a symmetry of parts, discover an adjustment of means to ends, and a tendency to self-preservation. If the actuating force cease after this operation, matter must remain for ever in disorder, and continue an immense chaos, without any proportion or activity. But suppose that the actuating force, whatever it be, still continues in matter, this first position will immediately give place to a second, which will likewise in all probability be as disorderly as the first, and so on through many successions of changes and revolutions. No particular order or position ever continues a moment unaltered. The original force, still remaining in activity, gives a perpetual restlessness to matter. Every possible situation is produced, and instantly destroyed. If a glimpse or dawn of order appears for a moment, it is instantly hurried

away, and confounded, by that never-ceasing force which actuates every part of matter.

Thus the universe goes on for many ages in a continued succession of chaos and disorder. But is it not possible that it may settle at last, so as not to lose its motion and active force (for that we have supposed inherent in it), yet so as to preserve an uniformity of appearance, amidst the continual motion and fluctuation of its parts? This we find to be the case with the universe at present. Every individual is perpetually changing, and every part of every individual; and yet the whole remains, in appearance, the same. May we not hope for such a position, or rather be assured of it, from the eternal revolutions of unguided matter; and may not this account for all the appearing wisdom and contrivance which is in the universe? Let us contemplate the subject a little, and we shall find, that this adjustment, if attained by matter of a seeming stability in the forms, with a real and perpetual revolution or motion of parts, affords a plausible, if not a true solution of the difficulty.

It is in vain, therefore, to insist upon the uses of the parts in animals or vegetables, and their curious adjustment to each other. I would fain know, how an animal could subsist, unless its parts were so adjusted? Do we not find, that it immediately perishes whenever this adjustment ceases, and that its matter corrupting tries some new form? It happens indeed, that the parts of the world are so well adjusted, that some regular form immediately lays claim to this corrupted matter: and if it were not so, could the world subsist? Must it not dissolve as well as the animal, and pass through new positions and situations, till in great, but finite succession, it falls at last into the present or some such order?

It is well, replied CLEANTHES, you told us, that this hypothesis was suggested on a sudden, in the course of the argument. Had you had leisure to examine it, you would soon have perceived the insuperable objections to which it is exposed. No form, you say, can subsist, unless it possess those powers and organs requisite for its subsistence: some new order or economy must be tried, and so on, without intermission; till at last some order, which can support and maintain itself, is fallen upon. But according to this hypothesis, whence arise the many conveniences and advantages which men and all animals possess? Two eyes, two ears, are not absolutely necessary for the subsistence of the species. Human race might have been propagated and preserved, without horses, dogs, cows, sheep, and those innumerable fruits and products which serve to our satisfaction and enjoyment. If no camels had been created for the use of man in the sandy deserts of AFRICA and ARABIA, would the world have been dissolved? If no lodestone had been framed to give that wonderful and useful direction to the needle, would human society and the human kind have been immediately extinguished? Though the maxims of Nature be in general very frugal, yet instances of this kind are far from being rare; and any one of them is a sufficient proof of design, and of a benevolent design, which gave rise to the order and arrangement of the universe.

At least, you may safely infer, said PHILO, that the foregoing hypothesis is so far incomplete and imperfect, which I shall not scruple to allow. But can we ever reasonably expect greater success in any attempts of this nature? Or can we ever hope to erect a system of cosmogony, that will be liable to no exceptions, and will contain no circumstance repugnant to our limited and imperfect experience of the analogy of Nature? Your theory itself cannot surely pretend to any such advantage, even though you have run into *Anthropomorphism*, the better to preserve a conformity to common experience. Let us once more put it to trial. In all instances which we have ever seen, ideas are copied from real objects, and are ectypal, not archetypal, to express myself in learned terms: You reverse this order, and give thought the precedence. In all instances which we have ever seen, thought has no influence upon matter, except where that matter is so conjoined with it as to have an equal reciprocal influence upon it. No animal can move immediately any thing but the

members of its own body; and indeed, the equality of action and reaction seems to be an universal law of nature: But your theory implies a contradiction to this experience. These instances, with many more, which it were easy to collect, (particularly the supposition of a mind or system of thought that is eternal, or, in other words, an animal ingenerable and immortal); these instances, I say, may teach all of us sobriety in condemning each other, and let us see, that as no system of this kind ought ever to be received from a slight analogy, so neither ought any to be rejected on account of a small incongruity. For that is an inconvenience from which we can justly pronounce no one to be exempted.

All religious systems, it is confessed, are subject to great and insuperable difficulties. Each disputant triumphs in his turn; while he carries on an offensive war, and exposes the absurdities, barbarities, and pernicious tenets of his antagonist. But all of them, on the whole, prepare a complete triumph for the Sceptic; who tells them, that no system ought ever to be embraced with regard to such subjects: For this plain reason, that no absurdity ought ever to be assented to with regard to any subject. A total suspense of judgement is here our only reasonable resource. And if every attack, as is commonly observed, and no defence, among Theologians, is successful; how complete must be *his* victory, who remains always, with all mankind, on the offensive, and has himself no fixed station or abiding city, which he is ever, on any occasion, obliged to defend?

Dialogues Concerning Natural Religion

David Hume

1779

PART 9

But if so many difficulties attend the argument *a posteriori*, said DEMEA, had we not better adhere to that simple and sublime argument *a priori*, which, by offering to us infallible demonstration, cuts off at once all doubt and difficulty? By this argument, too, we may prove the *infinity* of the Divine attributes, which, I am afraid, can never be ascertained with certainty from any other topic. For how can an effect, which either is finite, or, for aught we know, may be so; how can such an effect, I say, prove an infinite cause? The unity too of the Divine Nature, it is very difficult, if not absolutely impossible, to deduce merely from contemplating the works of nature; nor will the uniformity alone of the plan, even were it allowed, give us any assurance of that attribute. Whereas the argument *a priori* ....

You seem to reason, DEMEA, interposed CLEANTHES, as if those advantages and conveniences in the abstract argument were full proofs of its solidity. But it is first proper, in my opinion, to determine what argument of this nature you choose to insist on; and we shall afterwards, from itself, better than from its *useful* consequences, endeavour to determine what value we ought to put upon it.

The argument, replied DEMEA, which I would insist on, is the common one. Whatever exists must have a cause or reason of its existence; it being absolutely impossible for any thing to produce itself, or be the cause of its own existence. In mounting up, therefore, from effects to causes, we must either go on in tracing an infinite succession, without any ultimate cause at all; or must at last have recourse to some ultimate cause, that is *necessarily* existent: Now, that the first supposition is absurd, may be thus proved. In the infinite chain or succession of causes and effects, each single

effect is determined to exist by the power and efficacy of that cause which immediately preceded; but the whole eternal chain or succession, taken together, is not determined or caused by any thing; and yet it is evident that it requires a cause or reason, as much as any particular object which begins to exist in time. The question is still reasonable, why this particular succession of causes existed from eternity, and not any other succession, or no succession at all. If there be no necessarily existent being, any supposition which can be formed is equally possible; nor is there any more absurdity in Nothing's having existed from eternity, than there is in that succession of causes which constitutes the universe. What was it, then, which determined Something to exist rather than Nothing, and bestowed being on a particular possibility, exclusive of the rest? *External causes*, there are supposed to be none. *Chance* is a word without a meaning. Was it *Nothing*? But that can never produce any thing. We must, therefore, have recourse to a necessarily existent Being, who carries the REASON of his existence in himself, and who cannot be supposed not to exist, without an express contradiction. There is, consequently, such a Being; that is, there is a Deity.

I shall not leave it to PHILO, said CLEANTHES, though I know that the starting objections is his chief delight, to point out the weakness of this metaphysical reasoning. It seems to me so obviously ill-grounded, and at the same time of so little consequence to the cause of true piety and religion, that I shall myself venture to show the fallacy of it.

I shall begin with observing, that there is an evident absurdity in pretending to demonstrate a matter of fact, or to prove it by any arguments *a priori*. Nothing is demonstrable, unless the contrary implies a contradiction. Nothing, that is distinctly conceivable, implies a contradiction. Whatever we conceive as existent, we can also conceive as non-existent. There is no being, therefore, whose non-existence implies a contradiction. Consequently there is no being, whose existence is demonstrable. I propose this argument as entirely decisive, and am willing to rest the whole controversy upon it.

It is pretended that the Deity is a necessarily existent being; and this necessity of his existence is attempted to be explained by asserting, that if we knew his whole essence or nature, we should perceive it to be as impossible for him not to exist, as for twice two not to be four. But it is evident that this can never happen, while our faculties remain the same as at present. It will still be possible for us, at any time, to conceive the non-existence of what we formerly conceived to exist; nor can the mind ever lie under a necessity of supposing any object to remain always in being; in the same manner as we lie under a necessity of always conceiving twice two to be four. The words, therefore, *necessary existence*, have no meaning; or, which is the same thing, none that is consistent.

But further, why may not the material universe be the necessarily existent Being, according to this pretended explication of necessity? We dare not affirm that we know all the qualities of matter; and for aught we can determine, it may contain some qualities, which, were they known, would make its non-existence appear as great a contradiction as that twice two is five. I find only one argument employed to prove, that the material world is not the necessarily existent Being: and this argument is derived from the contingency both of the matter and the form of the world. "Any particle of matter," it is said, "may be *conceived* to be annihilated; and any form may be *conceived* to be altered. Such an annihilation or alteration, therefore, is not impossible."[22] But it seems a great partiality not to perceive, that the same argument extends equally to the Deity, so far as we have any conception of him; and that the mind can at least imagine him to be non-existent, or his

attributes to be altered. It must be some unknown, inconceivable qualities, which can make his non-existence appear impossible, or his attributes unalterable: And no reason can be assigned, why these qualities may not belong to matter. As they are altogether unknown and inconceivable, they can never be proved incompatible with it.

Add to this, that in tracing an eternal succession of objects, it seems absurd to inquire for a general cause or first author. How can any thing, that exists from eternity, have a cause, since that relation implies a priority in time, and a beginning of existence?

In such a chain, too, or succession of objects, each part is caused by that which preceded it, and causes that which succeeds it. Where then is the difficulty? But the *whole*, you say, wants a cause. I answer, that the uniting of these parts into a whole, like the uniting of several distinct countries into one kingdom, or several distinct members into one body, is performed merely by an arbitrary act of the mind, and has no influence on the nature of things. Did I show you the particular causes of each individual in a collection of twenty particles of matter, I should think it very unreasonable, should you afterwards ask me, what was the cause of the whole twenty. This is sufficiently explained in explaining the cause of the parts.

Though the reasonings which you have urged, CLEANTHES, may well excuse me, said PHILO, from starting any further difficulties, yet I cannot forbear insisting still upon another topic. It is observed by arithmeticians, that the products of 9, compose always either 9, or some lesser product of 9, if you add together all the characters of which any of the former products is composed. Thus, of 18, 27, 36, which are products of 9, you make 9 by adding 1 to 8, 2 to 7, 3 to 6. Thus, 369 is a product also of 9; and if you add 3, 6, and 9, you make 18, a lesser product of 9.[23] To a superficial observer, so wonderful a regularity may be admired as the effect either of chance or design: but a skilful algebraist immediately concludes it to be the work of necessity, and demonstrates, that it must for ever result from the nature of these numbers. Is it not probable, I ask, that the whole economy of the universe is conducted by a like necessity, though no human algebra can furnish a key which solves the difficulty? And instead of admiring the order of natural beings, may it not happen, that, could we penetrate into the intimate nature of bodies, we should clearly see why it was absolutely impossible they could ever admit of any other disposition? So dangerous is it to introduce this idea of necessity into the present question! and so naturally does it afford an inference directly opposite to the religious hypothesis!

But dropping all these abstractions, continued PHILO, and confining ourselves to more familiar topics, I shall venture to add an observation, that the argument *a priori* has seldom been found very convincing, except to people of a metaphysical head, who have accustomed themselves to abstract reasoning, and who, finding from mathematics, that the understanding frequently leads to truth through obscurity, and, contrary to first appearances, have transferred the same habit of thinking to subjects where it ought not to have place. Other people, even of good sense and the best inclined to religion, feel always some deficiency in such arguments, though they are not perhaps able to explain distinctly where it lies; a certain proof that men ever did, and ever will derive their religion from other sources than from this species of reasoning.

Dialogues Concerning Natural Religion

David Hume

1779

PART 10

It is my opinion, I own, replied DEMEA, that each man feels, in a manner, the truth of religion within his own breast, and, from a consciousness of his imbecility and misery, rather than from any reasoning, is led to seek protection from that Being, on whom he and all nature is dependent. So anxious or so tedious are even the best scenes of life, that futurity is still the object of all our hopes and fears. We incessantly look forward, and endeavour, by prayers, adoration, and sacrifice, to appease those unknown powers, whom we find, by experience, so able to afflict and oppress us. Wretched creatures that we are! what resource for us amidst the innumerable ills of life, did not religion suggest some methods of atonement, and appease those terrors with which we are incessantly agitated and tormented?

I am indeed persuaded, said PHILO, that the best, and indeed the only method of bringing every one to a due sense of religion, is by just representations of the misery and wickedness of men. And for that purpose a talent of eloquence and strong imagery is more requisite than that of reasoning and argument. For is it necessary to prove what every one feels within himself? It is only necessary to make us feel it, if possible, more intimately and sensibly.

The people, indeed, replied DEMEA, are sufficiently convinced of this great and melancholy truth. The miseries of life; the unhappiness of man; the general corruptions of our nature; the unsatisfactory enjoyment of pleasures, riches, honours; these phrases have become almost proverbial in all languages. And who can doubt of what all men declare from their own immediate feeling and experience?

In this point, said PHILO, the learned are perfectly agreed with the vulgar; and in all letters, *sacred* and *profane*, the topic of human misery has been insisted on with the most pathetic eloquence that sorrow and melancholy could inspire. The poets, who speak from sentiment, without a system, and whose testimony has therefore the more authority, abound in images of this nature. From Homer down to Dr. Young, the whole inspired tribe have ever been sensible, that no other representation of things would suit the feeling and observation of each individual.

As to authorities, replied DEMEA, you need not seek them. Look round this library of CLEANTHES. I shall venture to affirm, that, except authors of particular sciences, such as chemistry or botany, who have no occasion to treat of human life, there is scarce one of those innumerable writers, from whom the sense of human misery has not, in some passage or other, extorted a complaint and confession of it. At least, the chance is entirely on that side; and no one author has ever, so far as I can recollect, been so extravagant as to deny it.

There you must excuse me, said PHILO: LEIBNIZ has denied it; and is perhaps the first[24] who ventured upon so bold and paradoxical an opinion; at least, the first who made it essential to his philosophical system.

And by being the first, replied DEMEA, might he not have been sensible of his error? For is this a subject in which philosophers can propose to make discoveries especially in so late an age? And can any man hope by a simple denial (for the subject scarcely admits of reasoning), to bear down the united testimony of mankind, founded on sense and consciousness?

And why should man, added he, pretend to an exemption from the lot of all other animals? The whole earth, believe me, PHILO, is cursed and polluted. A perpetual war is kindled amongst all living creatures. Necessity, hunger, want, stimulate the strong and courageous: Fear, anxiety, terror, agitate the weak and infirm. The first entrance into life gives anguish to the new-born infant and to its wretched parent: Weakness, impotence, distress, attend each stage of that life: and it is at last finished in agony and horror.

Observe too, says PHILO, the curious artifices of Nature, in order to embitter the life of every living being. The stronger prey upon the weaker, and keep them in perpetual terror and anxiety. The weaker too, in their turn, often prey upon the stronger, and vex and molest them without relaxation. Consider that innumerable race of insects, which either are bred on the body of each animal, or, flying about, infix their stings in him. These insects have others still less than themselves, which torment them. And thus on each hand, before and behind, above and below, every animal is surrounded with enemies, which incessantly seek his misery and destruction.

Man alone, said DEMEA, seems to be, in part, an exception to this rule. For by combination in society, he can easily master lions, tigers, and bears, whose greater strength and agility naturally enable them to prey upon him.

On the contrary, it is here chiefly, cried PHILO, that the uniform and equal maxims of Nature are most apparent. Man, it is true, can, by combination, surmount all his real enemies, and become master of the whole animal creation: but does he not immediately raise up to himself imaginary enemies, the demons of his fancy, who haunt him with superstitious terrors, and blast every enjoyment of life? His pleasure, as he imagines, becomes, in their eyes, a crime: his food and repose give them umbrage and offence: his very sleep and dreams furnish new materials to anxious fear: and even death, his refuge from every other ill, presents only the dread of endless and innumerable woes. Nor does the wolf molest more the timid flock, than superstition does the anxious breast of wretched mortals.

Besides, consider, DEMEA: This very society, by which we surmount those wild beasts, our natural enemies; what new enemies does it not raise to us? What woe and misery does it not occasion? Man is the greatest enemy of man. Oppression, injustice, contempt, contumely, violence, sedition, war, calumny, treachery, fraud; by these they mutually torment each other; and they would soon dissolve that society which they had formed, were it not for the dread of still greater ills, which must attend their separation.

But though these external insults, said DEMEA, from animals, from men, from all the elements, which assault us, form a frightful catalogue of woes, they are nothing in comparison of those which arise within ourselves, from the distempered condition of our mind and body. How many lie under the lingering torment of diseases? Hear the pathetic enumeration of the great poet.

> Intestine stone and ulcer, colic-pangs, Demoniac frenzy, moping melancholy, And moon-struck madness, pining atrophy, Marasmus, and wide-wasting pestilence. Dire was the tossing, deep the groans: *despair* Tended the sick, busiest from couch to couch. And over them triumphant *death* his dart Shook: but delay'd to strike, though oft invok'd With vows, as their chief good and final hope.[25]

The disorders of the mind, continued DEMEA, though more secret, are not perhaps less dismal and vexatious. Remorse, shame, anguish, rage, disappointment, anxiety, fear, dejection, despair; who has ever passed through life without cruel inroads from these tormentors? How many have scarcely ever felt any better sensations? Labour and poverty, so abhorred by every one, are the certain lot of the far greater number; and those few privileged persons, who enjoy ease and opulence, never reach contentment or true felicity. All the goods of life united would not make a very happy man; but all the ills united would make a wretch indeed; and any one of them almost (and who can be free from every one?) nay often the absence of one good (and who can possess all?) is sufficient to render life ineligible.

Were a stranger to drop on a sudden into this world, I would show him, as a specimen of its ills, a hospital full of diseases, a prison crowded with malefactors and debtors, a field of battle strewed with carcasses, a fleet foundering in the ocean, a nation languishing under tyranny, famine, or pestilence. To turn the gay side of life to him, and give him a notion of its pleasures; whither should I conduct him? to a ball, to an opera, to court? He might justly think, that I was only showing him a diversity of distress and sorrow.

There is no evading such striking instances, said PHILO, but by apologies, which still further aggravate the charge. Why have all men, I ask, in all ages, complained incessantly of the miseries of life? ... They have no just reason, says one: these complaints proceed only from their discontented, repining, anxious disposition.... And can there possibly, I reply, be a more certain foundation of misery, than such a wretched temper?

But if they were really as unhappy as they pretend, says my antagonist, why do they remain in life? ... Not satisfied with life, afraid of death. This is the secret chain, say I, that holds us. We are terrified, not bribed to the continuance of our existence.

It is only a false delicacy, he may insist, which a few refined spirits indulge, and which has spread these complaints among the whole race of mankind. . . . And what is this delicacy, I ask, which you blame? Is it any thing but a greater sensibility to all the pleasures and pains of life? and if the man of a delicate, refined temper, by being so much more alive than the rest of the world, is only so much more unhappy, what judgement must we form in general of human life?

Let men remain at rest, says our adversary, and they will be easy. They are willing artificers of their own misery. . . . No! reply I: an anxious languor follows their repose; disappointment, vexation, trouble, their activity and ambition.

I can observe something like what you mention in some others, replied CLEANTHES: but I confess I feel little or nothing of it in myself, and hope that it is not so common as you represent it.

If you feel not human misery yourself, cried DEMEA, I congratulate you on so happy a singularity. Others, seemingly the most prosperous, have not been ashamed to vent their complaints in the most melancholy strains. Let us attend to the great, the fortunate emperor, CHARLES V, when, tired with human grandeur, he resigned all his extensive dominions into the hands of his son. In the last harangue which he made on that memorable occasion, he publicly avowed, *that the greatest prosperities which he had ever enjoyed, had been mixed with so many adversities, that he might truly say he had never enjoyed any satisfaction or contentment*. But did the retired life, in which he sought for shelter, afford him any greater happiness? If we may credit his son's account, his repentance commenced the very day of his resignation.

CICERO's fortune, from small beginnings, rose to the greatest lustre and renown; yet what pathetic complaints of the ills of life do his familiar letters, as well as philosophical discourses, contain? And suitably to his own experience, he introduces CATO, the great, the fortunate CATO, protesting in his old age, that had he a new life in his offer, he would reject the present.

Ask yourself, ask any of your acquaintance, whether they would live over again the last ten or twenty years of their life. No! but the next twenty, they say, will be better:

> **And from the dregs of life, hope to receive What the first sprightly running could not give.[26]**

Thus at last they find (such is the greatness of human misery, it reconciles even contradictions), that they complain at once of the shortness of life, and of its vanity and sorrow.

And is it possible, CLEANTHES, said PHILO, that after all these reflections, and infinitely more, which might be suggested, you can still persevere in your Anthropomorphism, and assert the moral attributes of the Deity, his justice, benevolence, mercy, and rectitude, to be of the same nature with these virtues in human creatures? His power we allow is infinite: whatever he wills is executed: but neither man nor any other animal is happy: therefore he does not will their happiness. His wisdom is infinite: He is never mistaken in choosing the means to any end: But the course of Nature tends not to human or animal felicity: therefore it is not established for that purpose. Through the whole compass of human knowledge, there are no inferences more certain and infallible than these. In what respect, then, do his benevolence and mercy resemble the benevolence and mercy of men?

EPICURUS's old questions are yet unanswered.

Is he willing to prevent evil, but not able? then is he impotent. Is he able, but not willing? then is he malevolent. Is he both able and willing? whence then is evil?

You ascribe, CLEANTHES (and I believe justly), a purpose and intention to Nature. But what, I beseech you, is the object of that curious artifice and machinery, which she has displayed in all animals? The preservation alone of individuals, and propagation of the species. It seems enough for her purpose, if such a rank be barely upheld in the universe, without any care or concern for the happiness of the members that compose it. No resource for this purpose: no machinery, in order merely to give pleasure or ease: no fund of pure joy and contentment: no indulgence, without some want or necessity accompanying it. At least, the few phenomena of this nature are overbalanced by

opposite phenomena of still greater importance.

Our sense of music, harmony, and indeed beauty of all kinds, gives satisfaction, without being absolutely necessary to the preservation and propagation of the species. But what racking pains, on the other hand, arise from gouts, gravels, megrims, toothaches, rheumatisms, where the injury to the animal machinery is either small or incurable? Mirth, laughter, play, frolic, seem gratuitous satisfactions, which have no further tendency: spleen, melancholy, discontent, superstition, are pains of the same nature. How then does the Divine benevolence display itself, in the sense of you Anthropomorphites? None but we Mystics, as you were pleased to call us, can account for this strange mixture of phenomena, by deriving it from attributes, infinitely perfect, but incomprehensible.

And have you at last, said CLEANTHES smiling, betrayed your intentions, PHILO ? Your long agreement with DEMEA did indeed a little surprise me; but I find you were all the while erecting a concealed battery against me. And I must confess, that you have now fallen upon a subject worthy of your noble spirit of opposition and controversy. If you can make out the present point, and prove mankind to be unhappy or corrupted, there is an end at once of all religion. For to what purpose establish the natural attributes of the Deity, while the moral are still doubtful and uncertain?

You take umbrage very easily, replied DEMEA, at opinions the most innocent, and the most generally received, even amongst the religious and devout themselves: and nothing can be more surprising than to find a topic like this, concerning the wickedness and misery of man, charged with no less than Atheism and profaneness. Have not all pious divines and preachers, who have indulged their rhetoric on so fertile a subject; have they not easily, I say, given a solution of any difficulties which may attend it? This world is but a point in comparison of the universe; this life but a moment in comparison of eternity. The present evil phenomena, therefore, are rectified in other regions, and in some future period of existence. And the eyes of men, being then opened to larger views of things, see the whole connection of general laws; and trace with adoration, the benevolence and rectitude of the Deity, through all the mazes and intricacies of his providence.

No! replied CLEANTHES, No! These arbitrary suppositions can never be admitted, contrary to matter of fact, visible and uncontroverted. Whence can any cause be known but from its known effects? Whence can any hypothesis be proved but from the apparent phenomena? To establish one hypothesis upon another, is building entirely in the air; and the utmost we ever attain, by these conjectures and fictions, is to ascertain the bare possibility of our opinion; but never can we, upon such terms, establish its reality.

The only method of supporting Divine benevolence, and it is what I willingly embrace, is to deny absolutely the misery and wickedness of man. Your representations are exaggerated; your melancholy views mostly fictitious; your inferences contrary to fact and experience. Health is more common than sickness; pleasure than pain; happiness than misery. And for one vexation which we meet with, we attain, upon computation, a hundred enjoyments.

Admitting your position, replied PHILO, which yet is extremely doubtful, you must at the same time allow, that if pain be less frequent than pleasure, it is infinitely more violent and durable. One hour of it is often able to outweigh a day, a week, a month of our common insipid enjoyments; and how many days, weeks, and months, are passed by several in the most acute torments? Pleasure, scarcely in one instance, is ever able to reach ecstasy and rapture; and in no one instance can it continue for any time at its highest pitch and altitude. The spirits evaporate, the nerves relax, the

fabric is disordered, and the enjoyment quickly degenerates into fatigue and uneasiness. But pain often, good God, how often! rises to torture and agony; and the longer it continues, it becomes still more genuine agony and torture. Patience is exhausted, courage languishes, melancholy seizes us, and nothing terminates our misery but the removal of its cause, or another event, which is the sole cure of all evil, but which, from our natural folly, we regard with still greater horror and consternation.

But not to insist upon these topics, continued PHILO, though most obvious, certain, and important; I must use the freedom to admonish you, CLEANTHES, that you have put the controversy upon a most dangerous issue, and are unawares introducing a total scepticism into the most essential articles of natural and revealed theology. What! no method of fixing a just foundation for religion, unless we allow the happiness of human life, and maintain a continued existence even in this world, with all our present pains, infirmities, vexations, and follies, to be eligible and desirable! But this is contrary to every one's feeling and experience: It is contrary to an authority so established as nothing can subvert. No decisive proofs can ever be produced against this authority; nor is it possible for you to compute, estimate, and compare, all the pains and all the pleasures in the lives of all men and of all animals: And thus, by your resting the whole system of religion on a point, which, from its very nature, must for ever be uncertain, you tacitly confess, that that system is equally uncertain.

But allowing you what never will be believed, at least what you never possibly can prove, that animal, or at least human happiness, in this life, exceeds its misery, you have yet done nothing: For this is not, by any means, what we expect from infinite power, infinite wisdom, and infinite goodness. Why is there any misery at all in the world? Not by chance surely. From some cause then. Is it from the intention of the Deity? But he is perfectly benevolent. Is it contrary to his intention? But he is almighty. Nothing can shake the solidity of this reasoning, so short, so clear, so decisive; except we assert, that these subjects exceed all human capacity, and that our common measures of truth and falsehood are not applicable to them; a topic which I have all along insisted on, but which you have, from the beginning, rejected with scorn and indignation.

But I will be contented to retire still from this entrenchment, for I deny that you can ever force me in it. I will allow, that pain or misery in man is *compatible* with infinite power and goodness in the Deity, even in your sense of these attributes: What are you advanced by all these concessions? A mere possible compatibility is not sufficient. You must *prove* these pure, unmixed, and uncontrollable attributes from the present mixed and confused phenomena, and from these alone. A hopeful undertaking! Were the phenomena ever so pure and unmixed, yet being finite, they would be insufficient for that purpose. How much more, where they are also so jarring and discordant!

Here, CLEANTHES, I find myself at ease in my argument. Here I triumph. Formerly, when we argued concerning the natural attributes of intelligence and design, I needed all my sceptical and metaphysical subtlety to elude your grasp. In many views of the universe, and of its parts, particularly the latter, the beauty and fitness of final causes strike us with such irresistible force, that all objections appear (what I believe they really are) mere cavils and sophisms; nor can we then imagine how it was ever possible for us to repose any weight on them. But there is no view of human life, or of the condition of mankind, from which, without the greatest violence, we can infer the moral attributes, or learn that infinite benevolence, conjoined with infinite power and infinite wisdom, which we must discover by the eyes of faith alone. It is your turn now to tug the labouring oar, and to support your philosophical subtleties against the dictates of plain reason and

experience.

Dialogues Concerning Natural Religion

David Hume

1779

PART 11

I scruple not to allow, said CLEANTHES, that I have been apt to suspect the frequent repetition of the word infinite, which we meet with in all theological writers, to savour more of panegyric than of philosophy; and that any purposes of reasoning, and even of religion, would be better served, were we to rest contented with more accurate and more moderate expressions. The terms, *admirable, excellent, superlatively great, wise*, and *holy*; these sufficiently fill the imaginations of men; and any thing beyond, besides that it leads into absurdities, has no influence on the affections or sentiments. Thus, in the present subject, if we abandon all human analogy, as seems your intention, DEMEA, I am afraid we abandon all religion, and retain no conception of the great object of our adoration. If we preserve human analogy, we must for ever find it impossible to reconcile any mixture of evil in the universe with infinite attributes; much less can we ever prove the latter from the former. But supposing the Author of Nature to be finitely perfect, though far exceeding mankind, a satisfactory account may then be given of natural and moral evil, and every untoward phenomenon be explained and adjusted. A less evil may then be chosen, in order to avoid a greater; inconveniences be submitted to, in order to reach a desirable end; and in a word, benevolence, regulated by wisdom, and limited by necessity, may produce just such a world as the present. You, PHILO, who are so prompt at starting views, and reflections, and analogies, I would gladly hear, at length, without interruption, your opinion of this new theory; and if it deserve our attention, we may afterwards, at more leisure, reduce it into form.

My sentiments, replied PHILO, are not worth being made a mystery of; and therefore, without any ceremony, I shall deliver what occurs to me with regard to the present subject. It must, I think, be

allowed, that if a very limited intelligence, whom we shall suppose utterly unacquainted with the universe, were assured, that it were the production of a very good, wise, and powerful Being, however finite, he would, from his conjectures, form *beforehand* a different notion of it from what we find it to be by experience; nor would he ever imagine, merely from these attributes of the cause, of which he is informed, that the effect could be so full of vice and misery and disorder, as it appears in this life. Supposing now, that this person were brought into the world, still assured that it was the workmanship of such a sublime and benevolent Being; he might, perhaps, be surprised at the disappointment; but would never retract his former belief, if founded on any very solid argument; since such a limited intelligence must be sensible of his own blindness and ignorance, and must allow, that there may be many solutions of those phenomena, which will for ever escape his comprehension. But supposing, which is the real case with regard to man, that this creature is not antecedently convinced of a supreme intelligence, benevolent, and powerful, but is left to gather such a belief from the appearances of things; this entirely alters the case, nor will he ever find any reason for such a conclusion. He may be fully convinced of the narrow limits of his understanding; but this will not help him in forming an inference concerning the goodness of superior powers, since he must form that inference from what he knows, not from what he is ignorant of. The more you exaggerate his weakness and ignorance, the more diffident you render him, and give him the greater suspicion that such subjects are beyond the reach of his faculties. You are obliged, therefore, to reason with him merely from the known phenomena, and to drop every arbitrary supposition or conjecture.

Did I show you a house or palace, where there was not one apartment convenient or agreeable; where the windows, doors, fires, passages, stairs, and the whole economy of the building, were the source of noise, confusion, fatigue, darkness, and the extremes of heat and cold; you would certainly blame the contrivance, without any further examination. The architect would in vain display his subtlety, and prove to you, that if this door or that window were altered, greater ills would ensue. What he says may be strictly true: The alteration of one particular, while the other parts of the building remain, may only augment the inconveniences. But still you would assert in general, that, if the architect had had skill and good intentions, he might have formed such a plan of the whole, and might have adjusted the parts in such a manner, as would have remedied all or most of these inconveniences. His ignorance, or even your own ignorance of such a plan, will never convince you of the impossibility of it. If you find any inconveniences and deformities in the building, you will always, without entering into any detail, condemn the architect.

In short, I repeat the question: Is the world, considered in general, and as it appears to us in this life, different from what a man, or such a limited being, would, *beforehand*, expect from a very powerful, wise, and benevolent Deity? It must be strange prejudice to assert the contrary. And from thence I conclude, that however consistent the world may be, allowing certain suppositions and conjectures, with the idea of such a Deity, it can never afford us an inference concerning his existence. The consistence is not absolutely denied, only the inference. Conjectures, especially where infinity is excluded from the Divine attributes, may perhaps be sufficient to prove a consistence, but can never be foundations for any inference.

There seem to be *four* circumstances, on which depend all, or the greatest part of the ills, that molest sensible creatures; and it is not impossible but all these circumstances may be necessary and unavoidable. We know so little beyond common life, or even of common life, that, with regard to the economy of a universe, there is no conjecture, however wild, which may not be just; nor any one, however plausible, which may not be erroneous. All that belongs to human understanding, in

this deep ignorance and obscurity, is to be sceptical, or at least cautious, and not to admit of any hypothesis whatever, much less of any which is supported by no appearance of probability. Now, this I assert to be the case with regard to all the causes of evil, and the circumstances on which it depends. None of them appear to human reason in the least degree necessary or unavoidable; nor can we suppose them such, without the utmost license of imagination.

The *first* circumstance which introduces evil, is that contrivance or economy of the animal creation, by which pains, as well as pleasures, are employed to excite all creatures to action, and make them vigilant in the great work of self-preservation. Now pleasure alone, in its various degrees, seems to human understanding sufficient for this purpose. All animals might be constantly in a state of enjoyment: but when urged by any of the necessities of nature, such as thirst, hunger, weariness; instead of pain, they might feel a diminution of pleasure, by which they might be prompted to seek that object which is necessary to their subsistence. Men pursue pleasure as eagerly as they avoid pain; at least they might have been so constituted. It seems, therefore, plainly possible to carry on the business of life without any pain. Why then is any animal ever rendered susceptible of such a sensation? If animals can be free from it an hour, they might enjoy a perpetual exemption from it; and it required as particular a contrivance of their organs to produce that feeling, as to endow them with sight, hearing, or any of the senses. Shall we conjecture, that such a contrivance was necessary, without any appearance of reason? and shall we build on that conjecture as on the most certain truth?

But a capacity of pain would not alone produce pain, were it not for the *second* circumstance, viz. the conducting of the world by general laws; and this seems nowise necessary to a very perfect Being. It is true, if everything were conducted by particular volitions, the course of nature would be perpetually broken, and no man could employ his reason in the conduct of life. But might not other particular volitions remedy this inconvenience? In short, might not the Deity exterminate all ill, wherever it were to be found; and produce all good, without any preparation, or long progress of causes and effects?

Besides, we must consider, that, according to the present economy of the world, the course of nature, though supposed exactly regular, yet to us appears not so, and many events are uncertain, and many disappoint our expectations. Health and sickness, calm and tempest, with an infinite number of other accidents, whose causes are unknown and variable, have a great influence both on the fortunes of particular persons and on the prosperity of public societies; and indeed all human life, in a manner, depends on such accidents. A being, therefore, who knows the secret springs of the universe, might easily, by particular volitions, turn all these accidents to the good of mankind, and render the whole world happy, without discovering himself in any operation. A fleet, whose purposes were salutary to society, might always meet with a fair wind. Good princes enjoy sound health and long life. Persons born to power and authority, be framed with good tempers and virtuous dispositions. A few such events as these, regularly and wisely conducted, would change the face of the world; and yet would no more seem to disturb the course of nature, or confound human conduct, than the present economy of things, where the causes are secret, and variable, and compounded. Some small touches given to CALIGULA's brain in his infancy, might have converted him into a TRAJAN. One wave, a little higher than the rest, by burying CAESAR and his fortune in the bottom of the ocean, might have restored liberty to a considerable part of mankind. There may, for aught we know, be good reasons why Providence interposes not in this manner; but they are unknown to us; and though the mere supposition, that such reasons exist, may be sufficient to save the conclusion concerning the Divine attributes, yet surely it can never be sufficient to *establish*

that conclusion.

If every thing in the universe be conducted by general laws, and if animals be rendered susceptible of pain, it scarcely seems possible but some ill must arise in the various shocks of matter, and the various concurrence and opposition of general laws; but this ill would be very rare, were it not for the third circumstance, which I proposed to mention, viz. the great frugality with which all powers and faculties are distributed to every particular being. So well adjusted are the organs and capacities of all animals, and so well fitted to their preservation, that, as far as history or tradition reaches, there appears not to be any single species which has yet been extinguished in the universe. Every animal has the requisite endowments; but these endowments are bestowed with so scrupulous an economy, that any considerable diminution must entirely destroy the creature. Wherever one power is increased, there is a proportional abatement in the others. Animals which excel in swiftness are commonly defective in force. Those which possess both are either imperfect in some of their senses, or are oppressed with the most craving wants. The human species, whose chief excellency is reason and sagacity, is of all others the most necessitous, and the most deficient in bodily advantages; without clothes, without arms, without food, without lodging, without any convenience of life, except what they owe to their own skill and industry. In short, nature seems to have formed an exact calculation of the necessities of her creatures; and, like a *rigid master*, has afforded them little more powers or endowments than what are strictly sufficient to supply those necessities. An *indulgent parent* would have bestowed a large stock, in order to guard against accidents, and secure the happiness and welfare of the creature in the most unfortunate concurrence of circumstances. Every course of life would not have been so surrounded with precipices, that the least departure from the true path, by mistake or necessity, must involve us in misery and ruin. Some reserve, some fund, would have been provided to ensure happiness; nor would the powers and the necessities have been adjusted with so rigid an economy. The Author of Nature is inconceivably powerful: his force is supposed great, if not altogether inexhaustible: nor is there any reason, as far as we can judge, to make him observe this strict frugality in his dealings with his creatures. It would have been better, were his power extremely limited, to have created fewer animals, and to have endowed these with more faculties for their happiness and preservation. A builder is never esteemed prudent, who undertakes a plan beyond what his stock will enable him to finish.

In order to cure most of the ills of human life, I require not that man should have the wings of the eagle, the swiftness of the stag, the force of the ox, the arms of the lion, the scales of the crocodile or rhinoceros; much less do I demand the sagacity of an angel or cherubim. I am contented to take an increase in one single power or faculty of his soul. Let him be endowed with a greater propensity to industry and labour; a more vigorous spring and activity of mind; a more constant bent to business and application. Let the whole species possess naturally an equal diligence with that which many individuals are able to attain by habit and reflection; and the most beneficial consequences, without any allay of ill, is the immediate and necessary result of this endowment. Almost all the moral, as well as natural evils of human life, arise from idleness; and were our species, by the original constitution of their frame, exempt from this vice or infirmity, the perfect cultivation of land, the improvement of arts and manufactures, the exact execution of every office and duty, immediately follow; and men at once may fully reach that state of society, which is so imperfectly attained by the best regulated government. But as industry is a power, and the most valuable of any, Nature seems determined, suitably to her usual maxims, to bestow it on men with a very sparing hand; and rather to punish him severely for his deficiency in it, than to reward him for his

attainments. She has so contrived his frame, that nothing but the most violent necessity can oblige him to labour; and she employs all his other wants to overcome, at least in part, the want of diligence, and to endow him with some share of a faculty of which she has thought fit naturally to bereave him. Here our demands may be allowed very humble, and therefore the more reasonable. If we required the endowments of superior penetration and judgement, of a more delicate taste of beauty, of a nicer sensibility to benevolence and friendship; we might be told, that we impiously pretend to break the order of Nature; that we want to exalt ourselves into a higher rank of being; that the presents which we require, not being suitable to our state and condition, would only be pernicious to us. But it is hard; I dare to repeat it, it is hard, that being placed in a world so full of wants and necessities, where almost every being and element is either our foe or refuses its assistance ... we should also have our own temper to struggle with, and should be deprived of that faculty which can alone fence against these multiplied evils.

The *fourth* circumstance, whence arises the misery and ill of the universe, is the inaccurate workmanship of all the springs and principles of the great machine of nature. It must be acknowledged, that there are few parts of the universe, which seem not to serve some purpose, and whose removal would not produce a visible defect and disorder in the whole. The parts hang all together; nor can one be touched without affecting the rest, in a greater or less degree. But at the same time, it must be observed, that none of these parts or principles, however useful, are so accurately adjusted, as to keep precisely within those bounds in which their utility consists; but they are, all of them, apt, on every occasion, to run into the one extreme or the other. One would imagine, that this grand production had not received the last hand of the maker; so little finished is every part, and so coarse are the strokes with which it is executed. Thus, the winds are requisite to convey the vapours along the surface of the globe, and to assist men in navigation: but how oft, rising up to tempests and hurricanes, do they become pernicious? Rains are necessary to nourish all the plants and animals of the earth: but how often are they defective? how often excessive? Heat is requisite to all life and vegetation; but is not always found in the due proportion. On the mixture and secretion of the humours and juices of the body depend the health and prosperity of the animal: but the parts perform not regularly their proper function. What more useful than all the passions of the mind, ambition, vanity, love, anger? But how oft do they break their bounds, and cause the greatest convulsions in society? There is nothing so advantageous in the universe, but what frequently becomes pernicious, by its excess or defect; nor has Nature guarded, with the requisite accuracy, against all disorder or confusion. The irregularity is never perhaps so great as to destroy any species; but is often sufficient to involve the individuals in ruin and misery.

On the concurrence, then, of these *four* circumstances, does all or the greatest part of natural evil depend. Were all living creatures incapable of pain, or were the world administered by particular volitions, evil never could have found access into the universe: and were animals endowed with a large stock of powers and faculties, beyond what strict necessity requires; or were the several springs and principles of the universe so accurately framed as to preserve always the just temperament and medium; there must have been very little ill in comparison of what we feel at present. What then shall we pronounce on this occasion? Shall we say that these circumstances are not necessary, and that they might easily have been altered in the contrivance of the universe? This decision seems too presumptuous for creatures so blind and ignorant. Let us be more modest in our conclusions. Let us allow, that, if the goodness of the Deity (I mean a goodness like the human) could be established on any tolerable reasons *a priori*, these phenomena, however untoward, would not be sufficient to subvert that principle; but might easily, in some unknown manner, be

reconcilable to it. But let us still assert, that as this goodness is not antecedently established, but must be inferred from the phenomena, there can be no grounds for such an inference, while there are so many ills in the universe, and while these ills might so easily have been remedied, as far as human understanding can be allowed to judge on such a subject. I am Sceptic enough to allow, that the bad appearances, notwithstanding all my reasonings, may be compatible with such attributes as you suppose; but surely they can never prove these attributes. Such a conclusion cannot result from Scepticism, but must arise from the phenomena, and from our confidence in the reasonings which we deduce from these phenomena.

Look round this universe. What an immense profusion of beings, animated and organised, sensible and active! You admire this prodigious variety and fecundity. But inspect a little more narrowly these living existences, the only beings worth regarding. How hostile and destructive to each other! How insufficient all of them for their own happiness! How contemptible or odious to the spectator! The whole presents nothing but the idea of a blind Nature, impregnated by a great vivifying principle, and pouring forth from her lap, without discernment or parental care, her maimed and abortive children!

Here the MANICHAEAN system occurs as a proper hypothesis to solve the difficulty: and no doubt, in some respects, it is very specious, and has more probability than the common hypothesis, by giving a plausible account of the strange mixture of good and ill which appears in life. But if we consider, on the other hand, the perfect uniformity and agreement of the parts of the universe, we shall not discover in it any marks of the combat of a malevolent with a benevolent being. There is indeed an opposition of pains and pleasures in the feelings of sensible creatures: but are not all the operations of Nature carried on by an opposition of principles, of hot and cold, moist and dry, light and heavy? The true conclusion is, that the original Source of all things is entirely indifferent to all these principles; and has no more regard to good above ill, than to heat above cold, or to drought above moisture, or to light above heavy.

There may *four* hypotheses be framed concerning the first causes of the universe: *that* they are endowed with perfect goodness; *that* they have perfect malice; *that* they are opposite, and have both goodness and malice; *that* they have neither goodness nor malice. Mixed phenomena can never prove the two former unmixed principles; and the uniformity and steadiness of general laws seem to oppose the third. The fourth, therefore, seems by far the most probable.

What I have said concerning natural evil will apply to moral, with little or no variation; and we have no more reason to infer, that the rectitude of the Supreme Being resembles human rectitude, than that his benevolence resembles the human. Nay, it will be thought, that we have still greater cause to exclude from him moral sentiments, such as we feel them; since moral evil, in the opinion of many, is much more predominant above moral good than natural evil above natural good.

But even though this should not be allowed, and though the virtue which is in mankind should be acknowledged much superior to the vice, yet so long as there is any vice at all in the universe, it will very much puzzle you Anthropomorphites, how to account for it. You must assign a cause for it, without having recourse to the first cause. But as every effect must have a cause, and that cause another, you must either carry on the progression *in infinitum*, or rest on that original principle, who is the ultimate cause of all things....

Hold! hold! cried DEMEA: Whither does your imagination hurry you? I joined in alliance with you, in order to prove the incomprehensible nature of the Divine Being, and refute the principles of CLEANTHES, who would measure every thing by human rule and standard. But I now find you

running into all the topics of the greatest libertines and infidels, and betraying that holy cause which you seemingly espoused. Are you secretly, then, a more dangerous enemy than CLEANTHES himself?

And are you so late in perceiving it? replied CLEANTHES. Believe me, DEMEA, your friend PHILO, from the beginning, has been amusing himself at both our expense; and it must be confessed, that the injudicious reasoning of our vulgar theology has given him but too just a handle of ridicule. The total infirmity of human reason, the absolute incomprehensibility of the Divine Nature, the great and universal misery, and still greater wickedness of men; these are strange topics, surely, to be so fondly cherished by orthodox divines and doctors. In ages of stupidity and ignorance, indeed, these principles may safely be espoused; and perhaps no views of things are more proper to promote superstition, than such as encourage the blind amazement, the diffidence, and melancholy of mankind. But at present....

Blame not so much, interposed PHILO, the ignorance of these reverend gentlemen. They know how to change their style with the times. Formerly it was a most popular theological topic to maintain, that human life was vanity and misery, and to exaggerate all the ills and pains which are incident to men. But of late years, divines, we find, begin to retract this position; and maintain, though still with some hesitation, that there are more goods than evils, more pleasures than pains, even in this life. When religion stood entirely upon temper and education, it was thought proper to encourage melancholy; as indeed mankind never have recourse to superior powers so readily as in that disposition. But as men have now learned to form principles, and to draw consequences, it is necessary to change the batteries, and to make use of such arguments as will endure at least some scrutiny and examination. This variation is the same (and from the same causes) with that which I formerly remarked with regard to Scepticism.

Thus PHILO continued to the last his spirit of opposition, and his censure of established opinions. But I could observe that DEMEA did not at all relish the latter part of the discourse; and he took occasion soon after, on some pretence or other, to leave the company.

Dialogues Concerning Natural Religion

David Hume

1779

PART 12

After DEMEA's departure, CLEANTHES and PHILO continued the conversation in the following manner. Our friend, I am afraid, said CLEANTHES, will have little inclination to revive this topic of discourse, while you are in company; and to tell truth, PHILO, I should rather wish to reason with either of you apart on a subject so sublime and interesting. Your spirit of controversy, joined to your abhorrence of vulgar superstition, carries you strange lengths, when engaged in an argument; and there is nothing so sacred and venerable, even in your own eyes, which you spare on that occasion.

I must confess, replied PHILO, that I am less cautious on the subject of Natural Religion than on any other; both because I know that I can never, on that head, corrupt the principles of any man of common sense; and because no one, I am confident, in whose eyes I appear a man of common sense, will ever mistake my intentions. You, in particular, CLEANTHES, with whom I live in unreserved intimacy; you are sensible, that notwithstanding the freedom of my conversation, and my love of singular arguments, no one has a deeper sense of religion impressed on his mind, or pays more profound adoration to the Divine Being, as he discovers himself to reason, in the inexplicable contrivance and artifice of nature. A purpose, an intention, a design, strikes every where the most careless, the most stupid thinker; and no man can be so hardened in absurd systems, as at all times to reject it. That Nature does nothing in vain, is a maxim established in all the schools, merely from the contemplation of the works of Nature, without any religious purpose; and, from a firm conviction of its truth, an anatomist, who had observed a new organ or canal, would never be satisfied till he had also discovered its use and intention. One great foundation of

the Copernican system is the maxim, *That Nature acts by the simplest methods, and chooses the most proper means to any end*; and astronomers often, without thinking of it, lay this strong foundation of piety and religion. The same thing is observable in other parts of philosophy: And thus all the sciences almost lead us insensibly to acknowledge a first intelligent Author; and their authority is often so much the greater, as they do not directly profess that intention.

It is with pleasure I hear GALEN reason concerning the structure of the human body. The anatomy of a man, says he,[27] discovers above 600 different muscles; and whoever duly considers these, will find, that, in each of them, Nature must have adjusted at least ten different circumstances, in order to attain the end which she proposed; proper figure, just magnitude, right disposition of the several ends, upper and lower position of the whole, the due insertion of the several nerves, veins, and arteries: So that, in the muscles alone, above 6000 several views and intentions must have been formed and executed. The bones he calculates to be 284: The distinct purposes aimed at in the structure of each, above forty. What a prodigious display of artifice, even in these simple and homogeneous parts! But if we consider the skin, ligaments, vessels, glandules, humours, the several limbs and members of the body; how must our astonishment rise upon us, in proportion to the number and intricacy of the parts so artificially adjusted! The further we advance in these researches, we discover new scenes of art and wisdom: But descry still, at a distance, further scenes beyond our reach; in the fine internal structure of the parts, in the economy of the brain, in the fabric of the seminal vessels. All these artifices are repeated in every different species of animal, with wonderful variety, and with exact propriety, suited to the different intentions of Nature in framing each species. And if the infidelity of GALEN, even when these natural sciences were still imperfect, could not withstand such striking appearances, to what pitch of pertinacious obstinacy must a philosopher in this age have attained, who can now doubt of a Supreme Intelligence!

Could I meet with one of this species (who, I thank God, are very rare), I would ask him: Supposing there were a God, who did not discover himself immediately to our senses, were it possible for him to give stronger proofs of his existence, than what appear on the whole face of Nature? What indeed could such a Divine Being do, but copy the present economy of things; render many of his artifices so plain, that no stupidity could mistake them; afford glimpses of still greater artifices, which demonstrate his prodigious superiority above our narrow apprehensions; and conceal altogether a great many from such imperfect creatures? Now, according to all rules of just reasoning, every fact must pass for undisputed, when it is supported by all the arguments which its nature admits of; even though these arguments be not, in themselves, very numerous or forcible: How much more, in the present case, where no human imagination can compute their number, and no understanding estimate their cogency!

I shall further add, said CLEANTHES, to what you have so well urged, that one great advantage of the principle of Theism, is, that it is the only system of cosmogony which can be rendered intelligible and complete, and yet can throughout preserve a strong analogy to what we every day see and experience in the world. The comparison of the universe to a machine of human contrivance, is so obvious and natural, and is justified by so many instances of order and design in Nature, that it must immediately strike all unprejudiced apprehensions, and procure universal approbation. Whoever attempts to weaken this theory, cannot pretend to succeed by establishing in its place any other that is precise and determinate: It is sufficient for him if he start doubts and difficulties; and by remote and abstract views of things, reach that suspense of judgement, which is here the utmost boundary of his wishes. But, besides that this state of mind is in itself unsatisfactory, it can never be steadily maintained against such striking appearances as continually

engage us into the religious hypothesis. A false, absurd system, human nature, from the force of prejudice, is capable of adhering to with obstinacy and perseverance: But no system at all, in opposition to a theory supported by strong and obvious reason, by natural propensity, and by early education, I think it absolutely impossible to maintain or defend.

So little, replied PHILO, do I esteem this suspense of judgement in the present case to be possible, that I am apt to suspect there enters somewhat of a dispute of words into this controversy, more than is usually imagined. That the works of Nature bear a great analogy to the productions of art, is evident; and according to all the rules of good reasoning, we ought to infer, if we argue at all concerning them, that their causes have a proportional analogy. But as there are also considerable differences, we have reason to suppose a proportional difference in the causes; and in particular, ought to attribute a much higher degree of power and energy to the supreme cause, than any we have ever observed in mankind. Here then the existence of a DEITY is plainly ascertained by reason: and if we make it a question, whether, on account of these analogies, we can properly call him a *mind* or *intelligence*, notwithstanding the vast difference which may reasonably be supposed between him and human minds; what is this but a mere verbal controversy? No man can deny the analogies between the effects: To restrain ourselves from inquiring concerning the causes is scarcely possible. From this inquiry, the legitimate conclusion is, that the causes have also an analogy: And if we are not contented with calling the first and supreme cause a GOD or DEITY, but desire to vary the expression; what can we call him but MIND or THOUGHT, to which he is justly supposed to bear a considerable resemblance?

All men of sound reason are disgusted with verbal disputes, which abound so much in philosophical and theological inquiries; and it is found, that the only remedy for this abuse must arise from clear definitions, from the precision of those ideas which enter into any argument, and from the strict and uniform use of those terms which are employed. But there is a species of controversy, which, from the very nature of language and of human ideas, is involved in perpetual ambiguity, and can never, by any precaution or any definitions, be able to reach a reasonable certainty or precision. These are the controversies concerning the degrees of any quality or circumstance. Men may argue to all eternity, whether HANNIBAL be a great, or a very great, or a superlatively great man, what degree of beauty CLEOPATRA possessed, what epithet of praise LIVY or THUCYDIDES is entitled to, without bringing the controversy to any determination. The disputants may here agree in their sense, and differ in the terms, or *vice versa*; yet never be able to define their terms, so as to enter into each other's meaning: Because the degrees of these qualities are not, like quantity or number, susceptible of any exact mensuration,[28] which may be the standard in the controversy. That the dispute concerning Theism is of this nature, and consequently is merely verbal, or perhaps, if possible, still more incurably ambiguous, will appear upon the slightest inquiry. I ask the Theist, if he does not allow, that there is a great and immeasurable, because incomprehensible difference between the *human* and the *divine* mind: The more pious he is, the more readily will he assent to the affirmative, and the more will he be disposed to magnify the difference: He will even assert, that the difference is of a nature which cannot be too much magnified. I next turn to the Atheist, who, I assert, is only nominally so, and can never possibly be in earnest; and I ask him, whether, from the coherence and apparent sympathy in all the parts of this world, there be not a certain degree of analogy among all the operations of Nature, in every situation and in every age; whether the rotting of a turnip, the generation of an animal, and the structure of human thought, be not energies that probably bear some remote analogy to each other: It is impossible he can deny it: He will readily acknowledge it.

Having obtained this concession, I push him still further in his retreat; and I ask him, if it be not probable, that the principle which first arranged, and still maintains order in this universe, bears not also some remote inconceivable analogy to the other operations of nature, and, among the rest, to the economy of human mind and thought. However reluctant, he must give his assent. Where then, cry I to both these antagonists, is the subject of your dispute? The Theist allows, that the original intelligence is very different from human reason: The Atheist allows, that the original principle of order bears some remote analogy to it. Will you quarrel, Gentlemen, about the degrees, and enter into a controversy, which admits not of any precise meaning, nor consequently of any determination? If you should be so obstinate, I should not be surprised to find you insensibly change sides; while the Theist, on the one hand, exaggerates the dissimilarity between the Supreme Being, and frail, imperfect, variable, fleeting, and mortal creatures; and the Atheist, on the other, magnifies the analogy among all the operations of Nature, in every period, every situation, and every position. Consider then, where the real point of controversy lies; and if you cannot lay aside your disputes, endeavour, at least, to cure yourselves of your animosity.

And here I must also acknowledge, CLEANTHES, that as the works of Nature have a much greater analogy to the effects of *our* art and contrivance, than to those of *our* benevolence and justice, we have reason to infer, that the natural attributes of the Deity have a greater resemblance to those of men, than his moral have to human virtues. But what is the consequence? Nothing but this, that the moral qualities of man are more defective in their kind than his natural abilities. For, as the Supreme Being is allowed to be absolutely and entirely perfect, whatever differs most from him, departs the furthest from the supreme standard of rectitude and perfection.[29]

These, CLEANTHES, are my unfeigned sentiments on this subject; and these sentiments, you know, I have ever cherished and maintained. But in proportion to my veneration for true religion, is my abhorrence of vulgar superstitions; and I indulge a peculiar pleasure, I confess, in pushing such principles, sometimes into absurdity, sometimes into impiety. And you are sensible, that all bigots, notwithstanding their great aversion to the latter above the former, are commonly equally guilty of both.

My inclination, replied CLEANTHES, lies, I own, a contrary way. Religion, however corrupted, is still better than no religion at all. The doctrine of a future state is so strong and necessary a security to morals, that we never ought to abandon or neglect it. For if finite and temporary rewards and punishments have so great an effect, as we daily find; how much greater must be expected from such as are infinite and eternal?

How happens it then, said PHILO, if vulgar superstition be so salutary to society, that all history abounds so much with accounts of its pernicious consequences on public affairs? Factions, civil wars, persecutions, subversions of government, oppression, slavery; these are the dismal consequences which always attend its prevalency over the minds of men. If the religious spirit be ever mentioned in any historical narration, we are sure to meet afterwards with a detail of the miseries which attend it. And no period of time can be happier or more prosperous, than those in which it is never regarded or heard of.

The reason of this observation, replied CLEANTHES, is obvious. The proper office of religion is to regulate the heart of men, humanise their conduct, infuse the spirit of temperance, order, and obedience; and as its operation is silent, and only enforces the motives of morality and justice, it is in danger of being overlooked, and confounded with these other motives. When it distinguishes itself, and acts as a separate principle over men, it has departed from its proper sphere, and has

become only a cover to faction and ambition.

And so will all religion, said PHILO, except the philosophical and rational kind. Your reasonings are more easily eluded than my facts. The inference is not just, because finite and temporary rewards and punishments have so great influence, that therefore such as are infinite and eternal must have so much greater. Consider, I beseech you, the attachment which we have to present things, and the little concern which we discover for objects so remote and uncertain. When divines are declaiming against the common behaviour and conduct of the world, they always represent this principle as the strongest imaginable (which indeed it is); and describe almost all human kind as lying under the influence of it, and sunk into the deepest lethargy and unconcern about their religious interests. Yet these same divines, when they refute their speculative antagonists, suppose the motives of religion to be so powerful, that, without them, it were impossible for civil society to subsist; nor are they ashamed of so palpable a contradiction. It is certain, from experience, that the smallest grain of natural honesty and benevolence has more effect on men's conduct, than the most pompous views suggested by theological theories and systems. A man's natural inclination works incessantly upon him; it is for ever present to the mind, and mingles itself with every view and consideration: whereas religious motives, where they act at all, operate only by starts and bounds; and it is scarcely possible for them to become altogether habitual to the mind. The force of the greatest gravity, say the philosophers, is infinitely small, in comparison of that of the least impulse: yet it is certain, that the smallest gravity will, in the end, prevail above a great impulse; because no strokes or blows can be repeated with such constancy as attraction and gravitation.

Another advantage of inclination: It engages on its side all the wit and ingenuity of the mind; and when set in opposition to religious principles, seeks every method and art of eluding them: In which it is almost always successful. Who can explain the heart of man, or account for those strange salvos and excuses, with which people satisfy themselves, when they follow their inclinations in opposition to their religious duty? This is well understood in the world; and none but fools ever repose less trust in a man, because they hear, that from study and philosophy, he has entertained some speculative doubts with regard to theological subjects. And when we have to do with a man, who makes a great profession of religion and devotion, has this any other effect upon several, who pass for prudent, than to put them on their guard, lest they be cheated and deceived by him?

We must further consider, that philosophers, who cultivate reason and reflection, stand less in need of such motives to keep them under the restraint of morals; and that the vulgar, who alone may need them, are utterly incapable of so pure a religion as represents the Deity to be pleased with nothing but virtue in human behaviour. The recommendations to the Divinity are generally supposed to be either frivolous observances, or rapturous ecstasies, or a bigoted credulity. We need not run back into antiquity, or wander into remote regions, to find instances of this degeneracy. Amongst ourselves, some have been guilty of that atrociousness, unknown to the Egyptian and Grecian superstitions, of declaiming in express terms, against morality; and representing it as a sure forfeiture of the Divine favour, if the least trust or reliance be laid upon it.

But even though superstition or enthusiasm should not put itself in direct opposition to morality; the very diverting of the attention, the raising up a new and frivolous species of merit, the preposterous distribution which it makes of praise and blame, must have the most pernicious consequences, and weaken extremely men's attachment to the natural motives of justice and humanity.

Such a principle of action likewise, not being any of the familiar motives of human conduct, acts only by intervals on the temper; and must be roused by continual efforts, in order to render the pious zealot satisfied with his own conduct, and make him fulfil his devotional task. Many religious exercises are entered into with seeming fervour, where the heart, at the time, feels cold and languid: A habit of dissimulation is by degrees contracted; and fraud and falsehood become the predominant principle. Hence the reason of that vulgar observation, that the highest zeal in religion and the deepest hypocrisy, so far from being inconsistent, are often or commonly united in the same individual character.

The bad effects of such habits, even in common life, are easily imagined; but where the interests of religion are concerned, no morality can be forcible enough to bind the enthusiastic zealot. The sacredness of the cause sanctifies every measure which can be made use of to promote it.

The steady attention alone to so important an interest as that of eternal salvation, is apt to extinguish the benevolent affections, and beget a narrow, contracted selfishness. And when such a temper is encouraged, it easily eludes all the general precepts of charity and benevolence.

Thus, the motives of vulgar superstition have no great influence on general conduct; nor is their operation favourable to morality, in the instances where they predominate.

Is there any maxim in politics more certain and infallible, than that both the number and authority of priests should be confined within very narrow limits; and that the civil magistrate ought, for ever, to keep his *fasces*[30] and *axes* from such dangerous hands? But if the spirit of popular religion were so salutary to society, a contrary maxim ought to prevail. The greater number of priests, and their greater authority and riches, will always augment the religious spirit. And though the priests have the guidance of this spirit, why may we not expect a superior sanctity of life, and greater benevolence and moderation, from persons who are set apart for religion, who are continually inculcating it upon others, and who must themselves imbibe a greater share of it? Whence comes it then, that, in fact, the utmost a wise magistrate can propose with regard to popular religions, is, as far as possible, to make a saving game of it, and to prevent their pernicious consequences with regard to society? Every expedient which he tries for so humble a purpose is surrounded with inconveniences. If he admits only one religion among his subjects, he must sacrifice, to an uncertain prospect of tranquillity, every consideration of public liberty, science, reason, industry, and even his own independency. If he gives indulgence to several sects, which is the wiser maxim, he must preserve a very philosophical indifference to all of them, and carefully restrain the pretensions of the prevailing sect; otherwise he can expect nothing but endless disputes, quarrels, factions, persecutions, and civil commotions.

True religion, I allow, has no such pernicious consequences: but we must treat of religion, as it has commonly been found in the world; nor have I any thing to do with that speculative tenet of Theism, which, as it is a species of philosophy, must partake of the beneficial influence of that principle, and at the same time must lie under a like inconvenience, of being always confined to very few persons.

Oaths are requisite in all courts of judicature; but it is a question whether their authority arises from any popular religion. It is the solemnity and importance of the occasion, the regard to reputation, and the reflecting on the general interests of society, which are the chief restraints upon mankind. Custom-house oaths and political oaths are but little regarded even by some who pretend to principles of honesty and religion; and a Quaker's asseveration is with us justly put upon the same footing with the oath of any other person. I know, that POLYBIUS[31] ascribes the infamy of

GREEK faith to the prevalency of the EPICUREAN philosophy: but I know also, that Punic faith had as bad a reputation in ancient times as Irish evidence has in modern; though we cannot account for these vulgar observations by the same reason. Not to mention that Greek faith was infamous before the rise of the Epicurean philosophy; and EURIPIDES,[32] in a passage which I shall point out to you, has glanced a remarkable stroke of satire against his nation, with regard to this circumstance.

Take care, PHILO, replied CLEANTHES, take care: push not matters too far: allow not your zeal against false religion to undermine your veneration for the true. Forfeit not this principle, the chief, the only great comfort in life; and our principal support amidst all the attacks of adverse fortune. The most agreeable reflection, which it is possible for human imagination to suggest, is that of genuine Theism, which represents us as the workmanship of a Being perfectly good, wise, and powerful; who created us for happiness; and who, having implanted in us immeasurable desires of good, will prolong our existence to all eternity, and will transfer us into an infinite variety of scenes, in order to satisfy those desires, and render our felicity complete and durable. Next to such a Being himself (if the comparison be allowed), the happiest lot which we can imagine, is that of being under his guardianship and protection.

These appearances, said PHILO, are most engaging and alluring; and with regard to the true philosopher, they are more than appearances. But it happens here, as in the former case, that, with regard to the greater part of mankind, the appearances are deceitful, and that the terrors of religion commonly prevail above its comforts.

It is allowed, that men never have recourse to devotion so readily as when dejected with grief or depressed with sickness. Is not this a proof, that the religious spirit is not so nearly allied to joy as to sorrow?

But men, when afflicted, find consolation in religion, replied CLEANTHES. Sometimes, said PHILO: but it is natural to imagine, that they will form a notion of those unknown beings, suitably to the present gloom and melancholy of their temper, when they betake themselves to the contemplation of them. Accordingly, we find the tremendous images to predominate in all religions; and we ourselves, after having employed the most exalted expression in our descriptions of the Deity, fall into the flattest contradiction in affirming that the damned are infinitely superior in number to the elect.

I shall venture to affirm, that there never was a popular religion, which represented the state of departed souls in such a light, as would render it eligible for human kind that there should be such a state. These fine models of religion are the mere product of philosophy. For as death lies between the eye and the prospect of futurity, that event is so shocking to Nature, that it must throw a gloom on all the regions which lie beyond it; and suggest to the generality of mankind the idea of CERBERUS and FURIES; devils, and torrents of fire and brimstone.

It is true, both fear and hope enter into religion; because both these passions, at different times, agitate the human mind, and each of them forms a species of divinity suitable to itself. But when a man is in a cheerful disposition, he is fit for business, or company, or entertainment of any kind; and he naturally applies himself to these, and thinks not of religion. When melancholy and dejected, he has nothing to do but brood upon the terrors of the invisible world, and to plunge himself still deeper in affliction. It may indeed happen, that after he has, in this manner, engraved the religious opinions deep into his thought and imagination, there may arrive a change of health or circumstances, which may restore his good humour, and raising cheerful prospects of futurity, make him run into the other extreme of joy and triumph. But still it must be acknowledged, that,

as terror is the primary principle of religion, it is the passion which always predominates in it, and admits but of short intervals of pleasure.

Not to mention, that these fits of excessive, enthusiastic joy, by exhausting the spirits, always prepare the way for equal fits of superstitious terror and dejection; nor is there any state of mind so happy as the calm and equable. But this state it is impossible to support, where a man thinks that he lies in such profound darkness and uncertainty, between an eternity of happiness and an eternity of misery. No wonder that such an opinion disjoints the ordinary frame of the mind, and throws it into the utmost confusion. And though that opinion is seldom so steady in its operation as to influence all the actions; yet it is apt to make a considerable breach in the temper, and to produce that gloom and melancholy so remarkable in all devout people.

It is contrary to common sense to entertain apprehensions or terrors upon account of any opinion whatsoever, or to imagine that we run any risk hereafter, by the freest use of our reason. Such a sentiment implies both an *absurdity* and an *inconsistency*. It is an absurdity to believe that the Deity has human passions, and one of the lowest of human passions, a restless appetite for applause. It is an inconsistency to believe, that, since the Deity has this human passion, he has not others also; and, in particular, a disregard to the opinions of creatures so much inferior.

***To know God*, says SENECA, *is to worship him*. All other worship is indeed absurd, superstitious, and even impious. It degrades him to the low condition of mankind, who are delighted with entreaty, solicitation, presents, and flattery. Yet is this impiety the smallest of which superstition is guilty. Commonly, it depresses the Deity far below the condition of mankind; and represents him as a capricious DEMON, who exercises his power without reason and without humanity! And were that Divine Being disposed to be offended at the vices and follies of silly mortals, who are his own workmanship, ill would it surely fare with the votaries of most popular superstitions. Nor would any of human race merit his *favour*, but a very few, the philosophical Theists, who entertain, or rather indeed endeavour to entertain, suitable notions of his Divine perfections: As the only persons entitled to his *compassion* and *indulgence* would be the philosophical Sceptics, a sect almost equally rare, who, from a natural diffidence of their own capacity, suspend, or endeavour to suspend, all judgement with regard to such sublime and such extraordinary subjects.**

If the whole of Natural Theology, as some people seem to maintain, resolves itself into one simple, though somewhat ambiguous, at least undefined proposition, *That the cause or causes of order in the universe probably bear some remote analogy to human intelligence:* If this proposition be not capable of extension, variation, or more particular explication: If it affords no inference that affects human life, or can be the source of any action or forbearance: And if the analogy, imperfect as it is, can be carried no further than to the human intelligence, and cannot be transferred, with any appearance of probability, to the other qualities of the mind; if this really be the case, what can the most inquisitive, contemplative, and religious man do more than give a plain, philosophical assent to the proposition, as often as it occurs, and believe that the arguments on which it is established exceed the objections which lie against it? Some astonishment, indeed, will naturally arise from the greatness of the object; some melancholy from its obscurity; some contempt of human reason, that it can give no solution more satisfactory with regard to so extraordinary and magnificent a question. But believe me, CLEANTHES, the most natural sentiment which a well-disposed mind will feel on this occasion, is a longing desire and expectation that Heaven would be pleased to dissipate, at least alleviate, this profound ignorance, by affording some more particular revelation to mankind, and making discoveries of the nature, attributes, and operations of the Divine object of our faith. A person, seasoned with a just sense of the imperfections of

natural reason, will fly to revealed truth with the greatest avidity: While the haughty Dogmatist, persuaded that he can erect a complete system of Theology by the mere help of philosophy, disdains any further aid, and rejects this adventitious instructor. To be a philosophical Sceptic is, in a man of letters, the first and most essential step towards being a sound, believing Christian; a proposition which I would willingly recommend to the attention of PAMPHILUS: And I hope CLEANTHES will forgive me for interposing so far in the education and instruction of his pupil.

CLEANTHES and PHILO pursued not this conversation much further: and as nothing ever made greater impression on me, than all the reasonings of that day, so I confess, that, upon a serious review of the whole, I cannot but think, that PHILO's principles are more probable than DEMEA's; but that those of CLEANTHES approach still nearer to the truth.

Dialogues Concerning Natural Religion

[28][Mensuration is a branch of geometry dealing with the measurement of length, area, or volume. -- Ed.]

[29]It seems evident that the dispute between the Skeptics and Dogmatists is entirely verbal, or at least regards only the degrees of doubt and assurance which we ought to indulge with regard to all reasoning; and such disputes are commonly, at the bottom, verbal, and admit not of any precise determination. No philosophical Dogmatist denies that there are difficulties both with regard to the senses and to all science, and that these difficulties are in a regular, logical method, absolutely insolvable. No Skeptic denies that we lie under an absolute necessity, notwithstanding these difficulties, of thinking, and believing, and reasoning, with regard to all kinds of subjects, and even of frequently assenting with confidence and security. The only difference, then, between these sects, if they merit that name, is, that the Sceptic, from habit, caprice, or inclination, insists most on the difficulties; the Dogmatist, for like reasons, on the necessity.

Essays on Suicide and the Immortality of the Soul:
The Complete 1783 Edition

David Hume

2/10/96

Editor's Note: Hume's essays on the suicide and the immortality of the soul were completed around 1755 and printed as part of a book of essays titled *Five Dissertations*. When pre-release copies of *Five Dissertations* provoked controversy among influential readers, Hume and his printer Andrew Millar agreed to have the two essays physically removed from the printed copies. They were replaced with an essay titled "Of the Standard of Taste," and the book of essays appeared in 1757 under the title *Four Dissertations*. Rumors about the two withdrawn essays circulated for years, and clandestine copies appeared anonymously in French (1770) and later in English (1777). In 1783 the two essays were published more openly, and this time with Hume's name attached. Like the 1770 and 1777 publications, the 1783 publication was not authorized by Hume. Along with Hume's two essays, the anonymous editor of the 1783 edition included his own critical notes to Hume's two pieces, and excerpts from Rousseau's *La Nouvelle Heloise* on the subject of suicide. The contents, then, of the 1783 publication are as follows:

A copy of the original two essays as they were printed in *Five Dissertations* is in the possession of the National Library of Scotland. That copy contains nineteen corrections in Hume's hand and is

Hume's final surviving revision of the essays. None of these corrections appear in the 1783 edition.

PREFACE

THESE two Essays on *Suicide* and *the Immortality of the Soul*, though not published in any edition of his works, are generally attributed to the late ingenious Mr. Hume.

The well-known contempt of this eminent philosopher for the common convictions of mankind, raised an apprehension of the contents from the very title of these pieces. But the celebrity of the author's name, renders them, notwithstanding, in some degree objects of great curiosity.

Owing to this circumstance, a few copies have been clandestinely circulated, at a large price, for some time, but without any comment. The very mystery attending this mode of selling them, made them more an object of request than they would otherwise have been. {iv}

The present publication comes abroad under no such restraint, and possesses very superior advantages. The *Notes* annexed are intended to expose the sophistry contained in the original Essays, and may shew how little we have to fear from the adversaries of these great truths, from the pitiful figure which even Mr. Hume makes in thus violently exhausting his last strength in an abortive attempt to traduce or discredit them.

The two very matterly Letters from the Eloisa of Rosseau on the subject of *Suicide*, have been much celebrated, and we hope will be considered as materially increasing the value of this curious collection.

The admirers of *Mr. Hume* will be pleased with seeing the remains of a favourite author rescued in this manner from that oblivion to which the prejudices of his countrymen had, in all appearance, consigned them; and even the religious part of mankind have some reason of triumph from the striking instance here given of truth's superiority to error, even when error has all the advantage of an elegant genius, and a great literary reputation to recommend it.

{1}

ESSAY I.
ON *SUICIDE*.

ONE considerable advantage that arises from Philosophy, consists in the sovereign antidote which it affords to superstition and false religion. All other remedies against that pestilent distemper are vain, or at least uncertain. Plain good sense and the practice of the world, which alone serve most purposes of life, are here found ineffectual: History as well as daily experience furnish instances of men endowed with the {2} strongest capacity for business and affairs, who have all their lives crouched under slavery to the grossest superstition. Even gaiety and sweetness of temper, which infuse a balm into every other wound, afford no remedy to so virulent a poison; as we may particularly observe of the fair sex, who tho' commonly possest of their rich presents of nature, feel many of their joys blasted by this importunate intruder. But when found Philosophy has once gained possession of the mind, superstition is effectually excluded, and one may fairly affirm that her triumph over this enemy is more complete than over most of the vices and imperfections incident to human nature. Love or anger, ambition or avarice, have their root in the temper and affection, which the soundest reason is scarce ever able fully to correct, but superstition being founded on false opinion, must immediately vanish when true philosophy has inspired juster sentiments of superior powers. The contest is here more equal between the distemper and the medicine, {3} and nothing can hinder the latter from proving effectual but its being false and sophisticated.

IT will here be superfluous to magnify the merits of Philosophy by displaying the pernicious tendency of that vice of which it cures the human mind. ([editor's note] 1) The superstitious man says Tully[2] is miserable in every scene, in every incident in life; even sleep itself, which banishes all other cares of unhappy mortals, affords to him matter of new terror; while he examines his dreams, and finds in those visions of the night prognostications of future calamities. I may add that tho' death alone can put a full period to his misery, he dares not fly to this refuge, but still prolongs a miserable existence from a vain fear left he offend his Maker, by using the power, with which that beneficent being has endowed him. The presents of God and nature are ravished from us by this {4} cruel enemy, and notwithstanding that one step would remove us from the regions of pain and sorrow, her menaces still chain us down to a hated being which she herself chiefly contributes to render miserable.

'TIS observed by such as have been reduced by the calamities of life to the necessity of employing this fatal remedy, that if the unseasonable care of their friends deprive them of that species of Death which they proposed to themselves, they seldom venture upon any other, or can summon up so much resolution a second time as to execute their purpose. So great is our horror of death, that when it presents itself under any form, besides that to which a man has endeavoured to reconcile his imagination, it acquires new terrors and overcomes his feeble courage: But when the menaces

of superstition are joined to this natural timidity, no wonder it quite deprives men of all power over their lives, since even many pleasures and enjoyments, {5} to which we are carried by a strong propensity, are torn from us by this inhuman tyrant. Let us here endeavour to restore men to their native liberty, by examining all the common arguments against Suicide, and shewing that that action may be free from every imputation of guilt or blame, according to the sentiments of all the antient philosophers. ([editor's note] 2)

IF Suicide be criminal, it must be a transgression of our duty either to God, our neighbour, or ourselves. -- To prove that suicide is no transgression of our duty to God, the following considerations may perhaps suffice. In order to govern the material world, the almighty Creator has established general and immutable laws, by which all bodies, from the greatest planet to the smallest particle of matter, are maintained in their proper sphere and function. To govern the animal world, he has endowed all living creatures with bodily and mental powers; with senses, passions, {6} appetites, memory, and judgement, by which they are impelled or regulated in that course of life to which they are destined. These two distinct principles of the material and animal world, continually encroach upon each other, and mutually retard or forward each others operation. The powers of men and of all other animals are restrained and directed by the nature and qualities of the surrounding bodies, and the modifications and actions of these bodies are incessantly altered by the operation of all animals. Man is stopt by rivers in his passage over the surface of the earth; and rivers, when properly directed, lend their force to the motion of machines, which serve to the use of man. But tho' the provinces of the material and animal powers are not kept entirely separate, there results from thence no discord or disorder in the creation; on the contrary, from the mixture, union, and contrast of all the various powers of inanimate bodies and living creatures, arises that sympathy, harmony, {7} and proportion, which affords the surest argument of supreme wisdom. The providence of the Deity appears not immediately in any operation, but governs every thing by those general and immutable laws, which have been established from the beginning of time. All events, in one sense, may be pronounced the action of the Almighty, they all proceed from those powers with which he has endowed his creatures. A house which falls by its own weight, is not brought to ruin by his providence, more than one destroyed by the hands of men; nor are the human faculties less his workmanship, than the laws of motion and gravitation. When the passions play, when the judgment dictates, when the limbs obey; this is all the operation of God, and upon these animate principles, as well as upon the inanimate, has he established the government of the universe. Every event is alike important in the eyes of that infinite being, who takes in at one glance the most distant regions of space, and {8} remotest periods of time. There is no event, however important to us, which he has exempted from the general laws that govern the universe, or which he has peculiarly reserved for his own immediate action and operation. The revolution of states and empires depends upon the smallest caprice or passion of single men; and the lives of men are shortened or extended by the smallest accident of air or dies, sunshine or tempest. Nature still continues her progress and operation; and if general laws be ever broke by particular volitions of the Deity, 'tis after a manner which entirely escapes human observation. As on the one hand, the elements and other inanimate parts of the creation carry on their action without regard to the particular interest and situation of men; so men are entrusted to their own judgment and discretion in the various shocks of matter, and may employ every faculty with which they are endowed, in order to provide for their ease, happiness, or {9} preservation. What is the meaning then of that principle, that a man who tired of life, and hunted by pain and misery, bravely overcomes all the natural terrors of death, and makes his escape from

this cruel scene: that such a man I say, has incurred the indignation of his Creator by encroaching on the office of divine providence, and disturbing the order of the universe? Shall we assert that the Almighty has reserved to himself in any peculiar manner the disposal of the lives of men, and has not submitted that event, in common with others, to the general laws by which the universe is governed? This is plainly false; the lives of men depend upon the same laws as the lives of all other animals; and these are subjected to the general laws of matter and motion. The fall of a tower, or the infusion of a poison, will destroy a man equally with the meanest creature; an inundation sweeps away every thing without distinction that comes within the reach of its fury. Since therefore the lives of men {10} are for ever dependant on the general laws of matter and motion, is a man's disposing of his life criminal, because in every case it is criminal to encroach upon these laws, or disturb their operation? But this seems absurd; all animals are entrusted to their own prudence and skill for their conduct in the world, and have full authority as far as their power extends, to alter all the operations of nature. Without the excercise of this authority they could not subsist a moment; every action, every motion of a man, innovates on the order of some parts of matter, and diverts from their ordinary course the general laws of motion. Putting together, therefore, these conclusion, we find that human life depends upon the general laws of matter and motion, and that it is no encroachment on the office of providence to disturb or alter these general laws: Has not every one, of consequence, the free disposal of his own life? And may he not lawfully employ that power with which nature has endowed him? In order {11} to destroy the evidence of this conclusion, we must shew a reason why this particular case is excepted; is it because human life is of such great importance, that 'tis a presumption for human prudence to dispose of it? But the life of a man is of no greater importance to the universe than that of an oyster. And were it of ever so great importance, the order of human nature has actually submitted it to human prudence, and reduced us to a necessity, in every incident, of determining concerning it. -- Were the disposal of human life so much reserved as the peculiar province of the Almighty, that it were an encroachment on his right, for men to dispose of their own lives; it would be equally criminal to act for the preservation of life as for its destruction. If I turn aside a stone which is falling upon my head, I disturb the course of nature, and I invade the peculiar province of the Almighty, by lengthening out my life beyond the period which by the general laws of matter and motion he had assigned it. ([editor's note] 3) {12}

A hair, a fly, an insect is able to destroy this mighty being whose life is of such importance. Is it an absurdity to suppose that human prudence may lawfully dispose of what depends on such insignificant causes? It would be no crime in me to divert the *Nile* or *Danube* from its course, were I able to effect such purposes. Where then is the crime of turning a few ounces of blood from their natural channel? -- Do you imagine that I repine at Providence or curse my creation, because I go out of life, and put a period to a being, which, were it to continue, would render me miserable? Far be such sentiments from me; I am only convinced of a matter of fact, which you yourself acknowledge possible, that human life may be unhappy, and that my existence, if further prolonged, would become ineligible; but I thank Providence, both for the good which I have already enjoyed, and for the power with which I am endowed of escaping the ill that {13} threatens me.[3] To you it belongs to repine at providence, who foolishly imagine that you have no such power, and who must still prolong a hated life, tho' loaded with pain and sickness, with shame and poverty -- Do not you teach, that when any ill befals me, tho' by the malice of my enemies, I ought to be resigned to providence, and that the actions of men are the operations of the Almighty as much as the actions of inanimate beings? When I fall upon my own sword, therefore, I receive my death

equally from the hands of the Deity as if it had proceeded from a lion, a precipice, or a fever. The submission which you require to providence, in every calamity that befals me, excludes not human skill and industry, if possible by their means I can avoid or escape the calamity: And why may I not employ one remedy as well as another? -- If my life be not my own, it were criminal for me to put it in danger, as {14} well as to dispose of it; nor could one man deserve the appellation of *hero*, whom glory or friendship transports into the greatest dangers, and another merit the reproach of *wretch* or *misereant* who puts a period to his life, from the same or like motives. -- There is no being, which possesses any power or faculty, that it receives not from its Creator, nor is there any one, which by ever so irregular an action can encroach upon the plan of his providence, or disorder the universe. Its operations are his works equally with that chain of events which it invades, and which ever principle prevails, we may for that very reason conclude it to be most favoured by him. Be it animate, or inanimate, rational, or irrational, 'tis all a case: its power is still derived from the supreme Creator, and is alike comprehended in the order of his providence. When the horror of pain prevails over the love of life; when a voluntary action anticipates the effects of blind causes, 'tis only in consequence of those {15} powers and principles which he has implanted in his creatures. Divine providence is still inviolate, and placed far beyond the reach of human injuries. 'Tis impious says the old Roman superstition[4] to divert rivers from their course, or invade the prerogatives of nature. 'Tis impious says the French superstition to inoculate for the small-pox, or usurp the business of providence by voluntarily producing distempers and maladies. 'Tis impious says the modern *European* superstition, to put a period to our own life, and thereby rebel against our Creator; and why not impious, say I, to build houses, cultivate the ground, or fail upon the ocean? In all these actions we employ our powers of mind and body, to produce some innovation in the course of nature; and in none of them do we any more. They are all of them therefore equally innocent, or equally criminal. *But you are placed by providence, like a centinal, in a particular station, {16} and when you desert it without being recalled, you are equally guilty of rebellion against your almighty sovereign, and have incurred his displeasure*. -- I ask, why do you conclude that providence has placed me in this station? For my part I find that I owe my birth to a long chain of causes, of which many depended upon voluntary actions of men. *But providence guided all these causes, and nothing happens in the universe without its consent and co-operation*. If so, then neither does my death, however voluntary, happen without its consent; and whenever pain or sorrow so far overcome my patience, as to make me tired of life, I may conclude that I am recalled from my station in the clearest and most express terms. 'Tis providence surely that has placed me at this present in this chamber: But may I not leave it when I think proper, without being liable to the imputation of having deserted my post or station? When I shall be dead, the principles of {17} which I am composed will still perform their part in the universe, and will be equally useful in the grand fabrick, as when they composed this individual creature. The difference to the whole will be no greater than betwixt my being in a chamber and in the open air. The one change is of more importance to me than the other; but not more so to the universe.

-- 'TIS a kind of blasphemy to imagine that any created being can disturb the order of the world, or invade the business of Providence! It supposes, that that being possesses powers and faculties, which it received not from its creator, and which are not subordinate to his government and authority. A man may disturb society no doubt, and thereby incur the displeasure of the Almighty: But the government of the world is placed far beyond his reach and violence. And how does it appear that the Almighty is displeased with those actions that disturb society? By the principles {18} which he has implanted in human nature, and which inspire us with a sentiment of remorse if

we ourselves have been guilty of such actions, and with that of blame and disapprobation, if we ever observe them in others: -- Let us now examine, according to the method proposed, whether Suicide be of this kind of actions, and be a breach of our duty to our *neighbour* and to *society*.

A MAN who retires from life does no harm to society: He only ceases to do good; which, if it is an injury, is of the lowest kind. -- All our obligations to do good to society seem to imply something reciprocal. I receive the benefits of society, and therefore ought to promote its interests; but when I withdraw myself altogether from society, can I be bound any longer? But allowing that our obligations to do good were perpetual, they have certainly some bounds; I am not obliged to do a small good to society at the expence of a {19} great harm to myself; why then should I prolong a miserable existence, because of some frivolous advantage which the public may perhaps receive from me? If upon account of age and infirmities, I may lawfully resign any office, and employ my time altogether in fencing against these calamities, and alleviating, as much as possible, the miseries of my future life: why may I not cut short these miseries at once by an action which is no more prejudicial to society? -- But suppose that it is no longer in my power to promote the interest of society, suppose that I am a burden to it, suppose that my life hinders some person from being much more useful to society. In such cases, my resignation of life must not only be innocent, but laudable. And most people who lie under any temptation to abandon existence, are in some such situation; those who have health, or power, or authority, have commonly better reason to be in humour with the world. ([editor's note] 4) {20}

A MAN is engaged in a conspiracy for the public interest; is seized upon suspicion; is threatened with the rack; and knows from his own weakness that the secret will be extorted from him: Could such a one consult the public interest better than by putting a quick period to a miserable life? This was the case of the famous and brave *Strozi* of *Florence*. -- Again, suppose a malefactor is justly condemned to a shameful death, can any reason be imagined, why he may not anticipate his punishment, and save himself all the anguish of thinking on its dreadful approaches? He invades the business of providence no more than the magistrate did, who ordered his execution; and his voluntary death is equally advantageous to society, by ridding it of a pernicious member.

THAT Suicide may often be consistent with interest and with our duty to ourselves, no one can question, who allows that age, {21} sickness, or misfortune, may render life a burthen, and make it worse even than annihilation. I believe that no man ever threw away life, while it was worth keeping. For such is our natural horror of death, that small motives will never be able to reconcile us to it; and though perhaps the situation of a man's health or fortune did not seem to require this remedy, we may at least be assured that any one who, without apparent reason, has had recourse to it, was curst with such an incurable depravity or gloominess of temper as must poison all enjoyment, and render him equally miserable as if he had been loaded with the most grievous misfortunes. -- If suicide be supposed a crime, 'tis only cowardice can impel us to it. If it be no crime, both prudence and courage should engage us to rid ourselves at once of existence, when it becomes a burthen. 'Tis the only way that we can then be useful to society, by setting an example, which if imitated, would preserve to every one his chance for happiness in life, {22} and would effectually free him from all danger of misery.[5]{23}

ESSAY II. ON THE *IMMORTALITY* OF THE *SOUL*.

BY the mere light of reason it seems difficult to prove the *Immortality* of the *Soul*; the arguments for it are commonly derived either from *metaphysical* topics, or *moral* or *physical*. But in reality 'tis the Gospel and the Gospel alone, that has brought *life and immortality to light*.

I. METAPHYSICAL topics suppose that the soul is immaterial, and that 'tis impossible {24} for thought to belong to a material substance. -- ([editor's note] 1) But just metaphysics teach us that the notion of substance is wholly confused and imperfect, and that we have no other idea of any substance, than as an aggregate of particular qualities, inhering in an unknown something. Matter, therefore, and spirit, are at bottom equally unknown, and we cannot determine what qualities inhere in the one or in the other. ([editor's note] 2) They likewise teach us that nothing can be decided *a priori* concerning any cause or effect, and that experience being the only source of our judgements of this nature, we cannot know from any other principle, whether matter, by its structure or arrangement, may not be the cause of thought. Abstract reasonings cannot decide any question of fact or existence. -- But admitting a spiritual substance to be dispersed throughout the universe, like the etherial fire of the *Stoics*, and to be the only inherent subject of thought, we have reason to conclude {25} from *analogy* that nature uses it after the manner she does the other substance, *matter*. She employs it as a kind of paste or clay; modifies it into a variety of forms and existences; dissolves after a time each modification, and from its substance erects a new form. As the same material substance may successively compose the bodies of all animals, the same spiritual substance may compose their minds: Their consciousness, or that system of thought which they formed during life, may be continually dissolved by death. And nothing interests them in the new modification. The most positive asserters of the mortality of the soul, never denied the immortality of its substance. And that an immaterial substance, as well as a material, may lose its memory or consciousness, appears in part from experience, if the soul be immaterial. -- Reasoning from the common course of nature, and without supposing any new interposition of the supreme cause, which ought always to be excluded from philosophy, {26} what is incorruptible must also be ingenerable. The Soul therefore if immortal, existed before our birth; and if the former existence no ways concerned us, neither will the latter. -- Animals undoubtedly feel, think, love, hate, will, and even reason, tho' in a more imperfect manner than men; are their souls also immaterial and immortal? ([editor's note] 3)

II. LET us now consider the moral arguments, chiefly those derived from the justice of God, which is supposed to be farther interested in the farther punishment of the vicious and reward of the virtuous. -- But these arguments are grounded on the supposition that God has attributes beyond what he has exerted in this universe, with which alone we are acquainted. Whence do we infer the existence of these attributes? -- 'Tis very safe for us to affirm, that whatever we know the Deity to have actually done, is best; but 'tis very dangerous to affirm, that he must always do {27} what to us seems best. In how many instances would this reasoning fail us with regard to the present world? -- But if any purpose of nature be clear, we may affirm, that the whole scope and intention of man's creation, so far as we can judge by natural reason, is limited to the present life. With how weak a concern from the original inherent structure of the mind and passions, does he ever look farther? What comparison either for steadiness or efficacy, betwixt so floating an idea, and the most doubtful persuasion of any matter of fact that occurs in common life. There arise indeed in some minds some unaccountable terrors with regard to futurity; but these would quickly vanish were they not artificially fostered by precept and education. And those who foster them, what is their motive? Only to gain a livelihood, and to acquire power and riches in this world. Their very

zeal and industry therefore is an argument against them. {28}

WHAT cruelty, what iniquity, what injustice in nature, to confine all our concern, as well as all our knowledge, to the present life, if there be another scene still waiting us, of infinitely greater consequence? Ought this barbarous deceit to be ascribed to a beneficent and wise being? -- Observe with what exact proportion the task to be performed and the performing powers are adjusted throughout all nature. If the reason of man gives him great superiority above other animals, his necessities are proportionably multiplied upon him; his whole time, his whole capacity, activity, courage, and passion, find sufficient employment in fencing against the miseries of his present condition, and frequently, nay almost always are too slender for the business assigned them. -- A pair of shoes perhaps was never yet wrought to the highest degree of perfection which that commodity is capable of attaining. Yet it is necessary, at least very useful, that there should be some politicians and moralists, {29} even some geometers, poets, and philosophers among mankind. The powers of men are no more superior to their wants, considered merely in this life, than those of foxes and hares are, compared to *their* wants and to their period of existence. The inference from parity of reason is therefore obvious. --

ON the theory of the Soul's mortality, the inferiority of women's capacity is easily accounted for. Their domestic life requires no higher faculties, either of mind or body. This circumstance vanishes and becomes absolutely insignificant, on the religious theory: the one sex has an equal task to perform as the other; their powers of reason and resolution ought also to have been equal, and both of them infinitely greater than at present. As every effect implies a cause, and that another, till we reach the first cause of all, which is the Deity; every thing that happens is ordained by him, and nothing can be the object of his punishment or vengeance. -- By what rule are punishments {30} and rewards distributed? What is the divine standard of merit and demerit? shall we suppose that human sentiments have place in the Deity? How bold that hypothesis. We have no conception of any other sentiments. -- According to human sentiments, sense, courage, good manners, industry, prudence, genius, &c. are essential parts of personal merits. Shall we therefore erect an elysium for poets and heroes like that of the antient mythology? Why confine all rewards to one species of virtue? Punishment, without any proper end or purpose, is inconsistent with *our* ideas of goodness and justice, and no end can be served by it after the whole scene is closed. Punishment, according to *our* conception, should bear some proportion to the offence. Why then eternal punishment for the temporary offences of so frail a creature as man? Can any one approve of *Alexander*'s rage, who intended to exterminate a whole nation because they had seized his favorite horse Bucephalus?[6] {31}

HEAVEN and Hell suppose two distinct species of men, the good and the bad; but the greatest part of mankind float betwixt vice and virtue. -- Were one to go round the world with an intention of giving a good supper to the righteous, and a sound drubbing to the wicked, he would frequently be embarrassed in his choice, and would find that the merits and the demerits of most men and women scarcely amount to the value of either. -- To suppose measures of approbation and blame different from the human confounds every thing. Whence do we learn that there is such a thing as moral distinctions, but from our own sentiments? -- What man who has not met with personal provocation (or what good-natured man who has) could inflict on crimes, from the sense of blame alone, even the common, legal, frivolous punishments? And does any thing steel the breast of judges and juries against the sentiments of humanity but reflection on necessity and public interest? {32} By the Roman law those who had been guilty of parricide and confessed their crime, were put into a sack alone with an ape, a dog, and a serpent, and thrown into the river. Death alone

was the punishment of those whose who denied their guilt, however fully proved. A criminal was tried before *Augustus*, and condemned after a full conviction, but the humane emperor, when he put the last interrogatory, gave it such a turn as to lead the wretch into a denial of his guilt. "You surely (said the "prince) did not kill your father."[7] This lenity suits our natural ideas of *right* even towards the greatest of all criminals, and even though it prevents so inconsiderable a sufference. Nay even the most bigotted priest would naturally without reflection approve of it, provided the crime was not heresy or infidelity; for as these crimes hurt himself in his *temporal* interest and advantages, perhaps he may not be altogether so {33} indulgent to them. The chief source of moral ideas is the reflection on the interest of human society. Ought these interests, so short, so frivolous, to be guarded by punishments eternal and infinite? The damnation of one man is an infinitely greater evil in the universe, than the subversion of a thousand millions of kingdoms. Nature has rendered human infancy peculiarly frail and mortal, as it were on purpose to refute the notion of a probationary state; the half of mankind die before they are rational creatures.

III. THE *Physical* arguments from the analogy of nature are strong for the mortality of the soul, and are really the only philosophical arguments which ought to be admitted with regard to this question, or indeed any question of fact. -- Where any two objects are so closely connected that all alterations which we have ever seen in the one, are attended with proportionable alterations in the other; we ought to conclude {34} by all rules of analogy, that, when there are still greater alterations produced in the former, and it is totally dissolved, there follows a total dissolution of the latter. -- Sleep, a very small effect on the body, is attended with a temporary extinction, at least a great confusion in the soul. -- The weakness of the body and that of the mind in infancy are exactly proportioned, their vigour in manhood, their sympathetic disorder in sickness; their common gradual decay in old age. The step further seems unavoidable; their common dissolution in death. The last symptoms which the mind discovers are disorder, weakness, insensibility, and stupidity, the fore-runners of its annihilation. The farther progress of the same causes encreasing, the same effects totally extinguish it. Judging by the usual analogy of nature, no form can continue when transferred to a condition of life very different from the original one, in which it was placed. Trees perish in the water, fishes in the air, animals in the earth. Even so small a difference as that of climate is often {35} fatal. What reason then to imagine, that an immense alteration, such as is made on the soul by the dissolution of its body and all its organs of thought and sensation, can be effected without the dissolution of the whole? Every thing is in common betwixt soul and body. The organs of the one are all of them the organs of the other. The existence therefore of the one must be dependant on that of the other. -- The souls of animals are allowed to be mortal; and these bear so near a resemblance to the souls of men, that the analogy from one to the other forms a very strong argument. Their bodies are not more resembling; yet no one rejects the argument drawn from comparative anatomy. The *Metempsychosis* is therefore the only system of this kind that philosophy can harken to. ([editor's note] 4)

NOTHING in this world is perpetual, every thing however seemingly firm is in continual flux and change, the world itself gives symptoms of frailty and dissolution. How contrary to analogy, therefore, to imagine {36} that one single from, seemingly the frailest of any, and subject to the greatest disorders, is immortal and indissoluble? ([editor's note] 5) What daring theory is that! how lightly, not to say how rashly entertained! How to dispose of the infinite number of posthumous existences ought also to embarrass the religious theory. Every planet in every solar system we are at liberty to imagine peopled with intelligent mortal beings, at least we can fix on no other supposition. For these then a new universe must every generation be created beyond the

bounds of the present universe, or one must have been created at first so prodigiously wise as to admit of this continual influx of beings. ([editor's note] 6) Ought such bold suppositions to be received by any philosophy, and that merely on there pretext of a bare possibility? When it is asked whether *Agamemnon Thersites Hannibal, Varro*, and every stupid clown that ever existed in *Italy*, *Scythia*, *Bactria* or *Guinea*, are now alive; can any man think, that a scrutiny of nature will furnish arguments {37} strong enough to answer so strange a question in the affirmative? The want of argument without revelation sufficiently establishes the negative. -- "*Quanto facilius* (says *Pliny*[8]) "*certius que sibi quemque credere, ac specimen securitatis antigene tali sumere experimento*." Our insensibility before the composition of the body, seems to natural reason a proof of a like state after dissolution. Were our horrors of annihilation an original passion, not the effect of our general love of happiness, it would rather prove the mortality of the soul. For as nature does nothing in vain, she would never give us a horror against an impossible event. She may give us a horror against an unavoidable; yet the human species could not be preserved had not nature inspired us with and aversion toward it. All doctrines are to be suspected which are favoured by {38} our passions, and the hopes and fears which gave rise to this doctrine are very obvious.

'TIS an infinite advantage in every controversy to defend the negative. If the question be out of the common experienced course of nature, this circumstance is almost if not altogether decisive. By what arguments or analogies can we prove any state of existence, which no one ever saw, and which no way resembles any that ever was seen? Who will repose such trust in any pretended philosophy as to admit upon its testimony the reality of so marvellous a scene? Some new species of logic is requisite for that purpose, and some new faculties of the mind, that may enable us to comprehend that logic.

NOTHING could set in a fuller light the infinite obligations which mankind have to divine revelation, since we find that no other medium could ascertain this great and important truth. {39}

ANTI SUICIDE.

(1) THIS elaborate eulogium on philosophy points obliquely at religion, which we christians consider as the only sovereign antidote to every disease incident to the mind of man. It is indeed hard to say what reason might do were it freed from all restraints, especially if a succession of philosophers were incessantly improving on one another as they went on, avoiding and correcting the mistakes of those who preceded them in the same pursuit, till at last one complete and rational system was effected. Great things might probably be accomplished in this manner. But no such plan in fact ever was or is likely to be finished. Neither priestcraft, nor magisterial powers, however, cramped the progress of improving reason, or baffled the genius of enquiring man. The principles of religion and virtue were freely canvassed by the boldest spirits of antiquity. In truth, the superior advantage and necessity of the christian religion seems manifest from this particular circumstance, {40} that it has taken away every possible restraint from natural religion, allowing it to exert itself to the utmost in finding out the fundamental truths of virtue, and in acquiescing in them, in openly avowing and acknowledging them when revealed, in extending the views and expectations of men, in giving them more just and liberal sentiments, and in publickly and uniformly disclaiming any intention of establishing a kingdom for its votaries or believers in this world.

THE doctrines of the gospel are not intended to instruct us in the knowledge of every thing which may be really useful in the present life, far less of every thing, which, from curiosity alone, we may

have a mighty desire to know. Revelation considers mankind in their highest capacity, as the rational and accountable subjects of God, and as capable both of present and future happiness or misery, according to their behaviour. Its chief, if not its sole design, is to give us those views and impressions of our nature, of our state, of the perfections, the counsels, the laws, and the government of God, which, under the influence of providence, are the immediate and infallible means of the purity, of the comfort, and of the moral order, rectitude, and excellence of our immortal souls. As corrupted and disordered, we are incapable of true happiness, till purified and restored to order. As guilty and {41} mortal creatures, we can have no true consolation without the hopes of pardon in a future and seperate state of existence. As surrounded with dangers, and obnoxious to every dismal apprehension, we can possess no solid, or permanent content, but in the sincere and well grounded convictions of that gracious and righteous administration so minutely and explicitly delineated in the scriptures. It is evident, therefore, that the principal excellence and utility of revealed truths upon the sanctification and consolation of our hearts. They tally exactly with the present circumstances of mankind, and are admirably adapted to cure every disease, every disorder of the human mind, to beget, to cherish, and confirm every pure, every virtuous, every pious disposition.

MANKIND are certainly at present in a state of the deepest corruption and depravity, and at the same time apt to continue strangely insensible of the misery and danger to which, under the government of infinite wisdom, it necessarily renders them. Nothing can be conceived more fit to rouse them from their lethargy, and to awaken them to a just sense of their condition, than a messenger from Heaven, clothed with divine authority, setting before them the intrinsic {42} baseness, malignity, and wretchedness of vice, together with the certain, the dreadful, the eternal consequences of continuing in it.

COULD we enter upon a particular view of all those maladies and disorders which infest and destroy the souls of men, it were easy to shew, that a steadfast belief of religion is, in truth, the most natural and the best antidote or remedy for each of them. It is obvious, or least, that the clear and full manifestation, which the gospel has given of the character of God, and the laws of his moral government, and of the terms of salvation through faith in the religion of his son, are all finely calculated to root out the principles of superstition, and all false notions, destructive to the virtue and happiness of mankind, and to plant in their room whatever has a natural and direct tendency to promote our virtue, our perfection, our felicity.

(2) CLEOMENES, king of Sparta, when suffering under misfortune, was advised to kill himself by Tharyceon. "Thinkest thou, wicked man, (said he) to shew thy fortitude by rushing upon death, an expedient always at hand, the dastardly resource of the {43} basest minds? Better than we, by the fortune of arms, or overpowered by numbers, have left the field of battle to their enemies; but he who, to avoid pain, or calamity, or censures of men, gives up the contest, we are to seek death, that death ought to be in action. It is base to live or die only for ourselves. All we gain by suicide is to get our own reputation, or doing the least service to our country. In hopes, then, we may yet be of some use to others, both methinks are bound to preserve life as long as we can. Whenever these hopes shall have altogether abandoned us, death, if sought for, will readily be found.

(3) OF all the refines cobwebs, to which sophistry has given birth, this seems at once the most elaborate and the most flimsy. It seems one of the first and most indisputable maxims in all found reasoning, that no ideas whatever should have a place in the premises, which do not communicate a sensible energy to the conclusion. But where is the connection between the beginning and end of this wire-drawn argument. What have the various beautiful facts, thus elegantly stated, to do with

a man's taking away his own {44} life? Though the greatest philosopher be of no more consequence to the general system of things than an oyster, and though the life of the one were, in every respect, as perfectly insignificant as that of the other, still the meanest of mankind is not without importance in his own eyes. And where is he who is guided uniformly, in all his actions, more by a sense of his relation to the universe at large, than by the value he retains for himself, or the deference he has to his own opinion.

NO deduction, however plausible, can produce conviction in any rational mind, which originates in a supposition grossly absurd. Is it possible to conceive the author of nature capable of authenticating a deed, which ultimately terminates in the total annihilation of the system? By which of the creatures beneath us is the first law of their being thus daringly violated? And if suicide be eligible to man, under any possible misfortune or distress, why not to them? Are not they also subject to the various miseries which arise from wayward accidents and hostile elements? Why, therefore, open a door for our escape from those evils of which others have their share, to whom, however, it must remain for ever shut? {45}

IN truth, the existence of all animals depends entirely on their inviolable attachment to self-preservation. Their attention to all is accordingly the obvious and common condition of all their natures. By this great and operative principle nature has chiefly consulted her own safety. Our philosopher's notions are so extremely hostile to her most essential institutions, that she could not possibly survive a general conviction of them. And, in spite of all the sophistry he is master of, the question here will eternally recur, whether the wisdom of nature, or the philosophy of our author, deserves the preference.

(4) THIS apology for the commission, arising from man's insignificance in the moral world, from the reciprocation of social duty being dissolved, or from the benefit resulting from the voluntary dismission of being, is contrary to the soundest principles of jurisprudence, to the condition of human nature, and to the general establishment of things.

THAT a man who retires from life *ad libitum*, does no harm to society, is a proposition peculiarly absurd and erroneous. What is {46} lawful for one, may be lawful for all, and no society can subsist in the conviction of a principle thus hostile to its being.

IT seems to be a maxim in human existence, that no creature has a right to decide peremptorily on the importance, utility, or necessity of his own being. There are an infinite variety of secret connections and associations in the vast system of things, which the eye of created wisdom cannot explore.

MAN is not, perhaps, so ignorant of anything, or any creature, as of himself. His own system, after all the art and inquisition of human ingenuity, is still to him the profoundest mystery in nature. His knowledge and faculties are adequate to the sphere of his duty. Beyond this, his researches are impertinent, and all his acquisitions useless. He has no adequate notions what the laws of the universe are with respect to any species of existence whatever. A cloud rests on the complicated movements of this great machine, which baffles all the penetration of mortals: and it will for ever remain impossible for man, from the most complete analysis of his present situation, to judge, with any degree of precision, of his own consequence, either as a citizen of the world at large, or as a member of any particular society. {47}

FINAL causes form a system of knowledge too wonderful for man. It is the perrogative of nature alone to decide upon them. In the fulness of time, her creative hand brought him into existence, and it belongs to her alone, in consequence of an arrangement equally wonderful and mysterious to

dismiss him from his present mode of being. This is an authority with which she alone is invested, and which, according to our apprehensions, it is impossible fro her to delegate. Dissolution, as well as creation, is hers. and he who would attempt to infringe her sovereignty in this instance, would usurp a prerogative which does not belong to him, and become a traitor to the laws of his being. Nay, on this extravagant and licentious hypothesis, the right of assuming and relinquishing existence is made reciprocal. For he who arrogates the liberty of destroying himself, were he possessed of the power, might also be his own creator; his imaginary insignificance to society being as inconclusive in the one case, as any chimerical advantage that may accidentally strike him can be in the other. It is a strange doctrine, which cannot be established, but at the obvious expence of what seem the plainest dictates of common sense.

INDEED, the absurdities of this daring and paradoxical doctrine are endless and infinite. {48} When we come to pronounce on the condition of human infancy, and to separate childhood, or non-age, from a state of maturity, we can scarce trace one useful or salutary consequence it is calculated to produce in society. In this view children seem less adapted to serve any special or important end, than even beetles, gnats, or flies. Experience, however, has long convinced the world of their present inestimable value from their future destination. And were a legislator, from the plausible pretext of their being a burden to the state, to exterminate the race of mankind in the insignificant stage of infancy, his decree, like that of a certain monster recorded in the gospel, would shock the sentiments of every nation under heaven, in whom there remained only the dregs of humanity.

IT is not only impossible for a man to decide, in any given period, of the progress of his existence, or what utility or consequence he may be to society; but without the faculty of prescience, it is still more impracticable for him to divine what purposes he may be intended to serve in the many mysterious revolations of futurity. How far his mortal may be connected with his immortal life, must rest with him who has the sole disposal of it. But who told him that his load of misery was too much to bear, that he was not able to sustain {49} it? or that his merciful father would not proportionate his sufferings to his abilities? How does he know how short-lived the pressure of incumbent sorrow may prove? It becomes not him to prescribe to his maker, or because his evils are enormous, to conclude they must be permanent. Rash man! thy heart is in the hand of heaven, and he *who tempers the wind to the shorn lamb,* may either lighten the burthen that oppresses thee, or blunt the edge of that sensibility, from which it derives the greatest poignancy. What medicine is to the wounds of the body, that resignation is to those of the soul. Be not deficient in this virtue, and life will never prescribe a duty you cannot perform, or inflict a pang which you cannot bear. Resignation changes the grizzly aspect of affliction, turns sickness into health, and converts the gloomy forebodings of despair into the grateful presentiments of hope. Besides, the most insignificant instruments are sometimes, in the hands of eternal providence, employed in bringing about the most general and beneficent revolutions. It is by making weakness thus subservient to power, evil to good, and pain to pleasure, that he who governs the world illustrates his sovereinty and omnipotence. Till, then, thou art {50} able to comprehend the whole mysterious system of every possible existence, till thou art certain that thy life is totally insignificant, till thou art convinced it is not in the might of infinite power to render thee serviceable either to thyself or others, counteract not the benignity of providence by suicide, or, in this manner, by the blackest of all treasons, betray thy trust, and wage, at fearful odds, hostility against the very means and author of thy being.

ONE very obvious consequence arising from suicide, which none of its advocates appear to have

foreseen, and which places it in a light exceedingly gross and shocking, is, that it supposes every man capable, not only of destroying himself, but of delegating the power of committing murder to another. That which he may do himself, he may commission any one to do for him. On this supposition, no law, human or divine, could impeach the shedding of innocent blood. And on what principle, of right or expediency, admit that which produces such a train of the most horrid and detestable consequences?

(5) THE preceding note is, perhaps, the most audacious part in the whole of this very extraordinary performance. In our holy religion it is expressly declared that no murderer hath eternal life abiding in him; that murderers shall in no wise inherit the kingdom of God, and that it is the prerogative of heaven alone to kill and make alive. It is a fundamental {51} doctrine in the gospel, that, except ye repent, ye shall all likewise perish. And how are they to perform their duty, who, in the instant of dying, contract a guilt, which renders it indispensible. But this horrid supposition is repugnant to the whole genius of revelation, which inculcates every virtue that can possibly administer to our present and future welfare. It inforces obedience and resignation to the righteous government of God. It inspires and produces those very dispositions which it recommends. All its doctrines, exhortations, and duties, are formed to elevate the mind, to raise the affections, to regulate the passions, and to purge the heart of whatever is hostile to happiness in this or another life. This impious slander on the christian faith is the obvious consequence of the grossest inattention to its nature and tendency. It is calculated chiefly to make us happy. And what happy man was ever yet chargeable with suicide? In short, we may as well say, that, because the physician does not expressly prohibit certain diseases in his prescriptions, the very diseases are authenticated by the remedies devised, on purpose to counteract them. {52}

IMMORTALITY OF THE SOUL.

(1) The ingenuity of Scepticism has been long admired, but here the author boldly outdoes all his former out-doings. Much has been said against the authenticity of religion, on the supposition that the evidence to which she appeals, is not either sufficiently general or intelligible to the bulk of mankind. But surely an argument is not conclusive in one case, and inconclusive in another. Admit this reasoning against revelation to be valid, and you must also admit it against our author's hypothesis. There never at least was an objection started, that could, in the remotest degree, affect the truths of the gospel, more intricate, metaphysical, and abstracted, than that by which our essayest would destroy the popular doctrine of the soul's *immortality*. How many live and die in this salutary conviction, to whom these refined speculations must forever remain as unintelligible as if they had {53} never been formed! It is a sentiment so congenial to the heart of man, that few of the species would chuse to exist without it. Unable, as they are, to account for its origin, they cordially and universally indulge it, as one of their tenderest, best, and last feelings. It inhabits alike the rudest and most polished minds, and never leaves any human breast, which is not either wholly engrossed by criminal pleasure, deadened by selfish pursuits, or perverted by false reasoning. It governs with all the ardor and influence of inspiration, and never meets with any opposition but from the weak, the worthless, or the *wise above what is written*. All the world have uniformly considered it as their last resource in every extremity, and for the most part still regard and cherish the belief of it, as an asylum in which their best interests are ultimately secured or deposited, beyond the reach of all temporary disaster or misfortune. Where, therefore, is the probability of exterminating so popular and prevailing a notion, by a concatenation of ideas, which, perhaps, not one out of a million in any country under Heaven is able to trace or

comprehend?

(2) The natural perceptions of pleasure of pain cannot be said to act on the mind as one part of matter does on another. The substance of the soul we do not know, but are {54} certain her ideas must be immaterial. And these cannot possibly act either by contact of impulse. When one body impels another, the body moved is affected only by the impulse. But the mind, whenever roused by any pleasing or painful sensation, in most cases looks round her, and deliberates whether a change of state is proper, or the present more eligible; and moves or rests accordingly. Her perceptions, therefore, contribute no further to action, than by exciting her active powers. On the contrary, matter is blindly and obstinately in that state in which it is, whether of motion or rest, till changed by some other adequate cause. Suppose we rest the state of any body, some external force is requisite to put it in motion; and, in proportion as this force is greater or small, the motion must be swift or slow. Did not this body continue in its former state, no external force would be requisite to change it; nor, when changed, would different degrees of force be necessary to move it in different degrees of velocity. When motion is impressed on any body, to bring it to rest, an *extra* force must always be applied, in proportion to the intended effect. This resistance is observeable in bodies both when moved in particular directions, and to bear an exact proportion to the *vis impressa*, and to the quantity of matter moved. Were it possible to extract from matter the qualities of solidity and extension, {55} the matter whence such qualities were extracted would no longer resist; and consequently resistance is the necessary result of them, which, therefore, in all directions must be the same. The degree of resistance in any body being proportionate to the *vis impressa*, it follows, when that body is considered in any particular state, whether of motion or rest, the degrees of resistance must either indefinitely multiply, or decrease, according to all possible degrees of the moving force. But when the same body is considered absolutely, or without fixing any particular state, the resistance is immutable; and all the degrees of it, which that body would exert upon the accession of any impressed force, must be conceived as actually in it. Nor can matter have any tendency contrary to that resistance, otherwise it must be equal or superior. If equal, the two contrary tendencies would destroy each other. If superior, the resistance would be destroyed. Thus change would eternally succeed to change without one intermediate instant, so that no time would be assigned when any body was in any particular state. Gravitation itself, the most simple and universal law, seems far from being a tendency natural to matter; since it is found to act internally, and not in proportion to the superfices of any body; which it would not do, if it were only the mechanical action of matter upon matter. {56} From all this, it appears, that matter considered merely as such, is so far from having a principle of spontaneous motion, that it is stubbornly inactive, and must eternally remain in the same state in which it happens to be, except influenced by some other -- that is, some immaterial power. Of such a power the human soul is evidently possessed; for every one is conscious of an internal activity, and to dispute this would be to dispute us out of one of the most real and intimate perceptions we have.

Though a material automaton were allowed possible, how infinitely would it fall short of that force and celerity which every one feels in himself. how sluggish are all the movements which fall under our observation. How slow and gradual their transitions from one part of space to another. But the mind, by one instantaneous effort, measures the distance from pole to pole, from heaven to earth, from one fixed star to another; and not confined within the limits of the visible creation, shoots into immensity with a rapidity to which even that of lightning, or sunbeams, is no comparison. Who then shall assign a period, which, though depressed with so much dead weight, is ever active, and unconscious of fatigue or relaxation? The mind is not only herself a principle of action, but

probably actuates the body, without the {57} assistance of any intermediate power, both from the gradual command which she acquires of its members by habit, and from a capacity of determining, in some measure, the quantity of pleasure or pain which any sensible perception can give her. Supposing the interposing power a spirit, the same difficulty of spirit acting upon matter still remains. And the volition of our own mind will as well account for the motion of the body, as the formal interference of any other spiritual substance. And we may as well ask, why the mind is not conscious of that interposition, as why she is ignorant of the means by which she communicates motion to the body.

(3) It is always bad reasoning to draw conclusions from the premises not denied by your adversary. Whoever, yet, of all the assertors of the soul's immortality, presumed to make a monopoly of this great privilege to the human race? Who can tell what another state of existence may be, or whether every other species of animals may not possess principles an immortal as the mind of man? But that mode of reasoning, which militates against all our convictions, solely on account of the unavoidable ignorance to which our sphere in the universe subjects us, can never be satisfactory. Reason, it is true, cannot altogether solve every doubt which arises concerning this important truth. But neither is there any other {58} truth, of any denomination whatever, against which sophistry may not conjure up a multitude of exceptions. We know no mode of existence but those of matter and spirit, neither of which have uniformly and successfully defied the extreme subtilty of argumentation. Still a very great majority of mankind are staunch believers in both. So well constituted is the present disposition of things, that all the principles essential to human life and happiness continue, as it is likely they ever will, to operate, in spite of every sort of clamour which sophistry or scepticism has raised or can raise against them.

(4) There is not a single word in all this elaborate and tedious deduction, which has not been urged and refuted five hundred times. Our ignorance of the divine perfections, as is usual with this writer, is here stated as an unanswerable exception to the conclusion usually drawn from them. But he very artfully overlooks, that this great ignorance will be equally conclusive as applied to either side of the argument. When we compare, however, the character of God, as a wise superintendant, and generous benefactor, with the state in which things at present appear, where virtue is often depressed and afflicted, and vice apparently triumphs, it will be treated with the infamy it merits, and virtue receive that {59} happiness and honour, which, from its own intrinsic worth, it deserves, and, from its conformity to the nature of God, it has reason to expect.

This subject, perhaps, has been too much exaggerated, and some pious men have weakly thought, the best way to convince us that order and happiness prevailed in a future state, was to persuade us that there was none at all in this. External advantages have been taken for the only goods of human nature; and, because, in this view, all things speak the appearance of mal-administration, we have been taught to expect a government of rectitude and benevolence hereafter. Let us, on the contrary, candidly own that virtue is sovereignly and solely good, left, by depreciating her charms, we obliquely detract from the character of God himself. Let us confess her undowered excellence superior to all the inconveniences that may attend her, even in the present situation. But, without allowing some difference between poverty and riches, sickness and health, pain and pleasure, &c. we shall have no foundation to preference; and it will be in vain to talk of selecting where no one choice can be more agreeable or disagreeable to nature than another. Upon this difference, therefore, however it be called, let the present argument proceed. {60}

If infinite goodness be the spirit and characteristic of this universal government, then every advantage, however inconsiderable in kind or degree, must either be supposed immediately

bestowed on virtue; or, at least, that such retributions will, at some time, be made her, as may not only render her votaries equal, but superior to those of vice, in proportion to their merit. But how different the case is in human life, history and observation may easily convince us; so that one, whose eyes are not intent on the character of God, and the nature of virtue, would often be tempted to think this world a theatre merely intended for mournful spectacles and pomps of horror. How many persons do we see perish by the mere wants of nature, who, had they been in different circumstances, would have thanked God with tears of joy for the power of communicating those advantages they now implore from others in vain? While, at the same time, they have, perhaps, the additional misery of seeing the most endeared relations involved in the same deplorable fate! How often do we see those ties which unite the soul and body, worn out by the gradual advances of a lingering disease, or burst at once by the sudden efforts of unutterable agony? While the unhappy sufferers, had they been continued in life, might have diffused happiness, not only through the narrow circle of their {61} friends and neighbourhood, but as extensively as their country, and even the world at large. How many names do we see buried in obscurity, or soiled with detraction, which ought to have shone the first in fame? How many heroes have survived the liberties of their country, or died in abortive attempts to preserve them; and, by their fall, only left a larger field for the lawless ravages of tyranny and oppression?

But were it possible, how long and insuperable would be the task to enumerate all the ingredients which compose the present cup of bitterness? And is this the consummation of things? Will supreme and essential goodness no way distinguish such as have invariably pursued his honour, and the interest of his government, from those who have industriously violated the order he has appointed in things? who have blotted the face of nature with havock, murder, and desolation; and shewn a constant intention to counteract all the benevolent designs of providence? It is confessed that the virtuous, happy in the possession of virtue alone, make their exit from the present scene with blessings to the Creator, for having called them to existence, and given them the glorious opportunity of enjoying what is in itself supremely eligible. They are conscious that this felicity can receive no accession from any external lustre or advantage {62} whatever. Yet it seems highly necessary in the divine administration, that those who have been dazzled with the false glare of prosperous wickedness, should at last be undeceived; that they should at last behold virtue conspicuous, in all her native splendor and majesty as she shines, the chief delight of God, and ultimate happiness of all intelligent nature.

The language of religion, and our own hearts, on this important argument, is equally comfortable and decisive. It accumulates and enforces whatever can inspire us with confidence in that God, who is not the God of the dead, but of the living; who reigns in the invisible, as well as in the visible world; and whose attention to our welfare ceases not with our lives, but is commensurate to the full extent of our being. Indeed the votaries of the soul's mortality may as well be honest for once, and speak out what so many fools think in their hearts. For what is God to us, or we to him, if our connection extends but to the pitiful space allotted us in such a pitiful world as this is? To be sure, no absurdity will be rejected, which can smother the feelings, or keep the vices of profligates in countenance; but, if only made like worms and reptiles beneath our feet, to live this moment, and expire the next, to struggle in a wretched life with every internal and external calamity, {63} that can assault our bodies, or infest our minds; to bear the mortifications of malignity, and the unmerited abhorrence of those who perhaps may owe us the greatest and tenderest esteem, and then, sunk in everlasting oblivion, our fate would stand on record, in the annals of the universe, an eternal exception to all that can be called good.

Suppose a father possessed of the most exquisite tenderness for his son, delighted with his similarity of form, his promising constitution, his strength, gracefulness, and agility, his undisguised emotions of filial affection, with the various presages of a superior genius and understanding. Let us suppose this father pleased with the employment of improving his faculties, and inspiring him with future hopes of happiness and dignity: but that he may give him a quicker sensibility to the misfortunes of others, and a more unshaken fortitude to sustain his own, he often prefers younger brethren, and even strangers, to those advantages which otherwise merit, and the force of nature would determine him to bestow on so worthy an offspring. Let us go further, and imagine, if we can, that this father, without the least diminution of tenderness, or any other apparent reason, destroys his son in the bloom of life, and height of expectation: Who would not lament the fate of such a youth with inconsolable tears? {64} Doomed never more to behold the agreeable light of Heaven! never more to display his personal graces, nor exercise his manly powers, never more to feel his heart warm with benevolent regards, nor taste the soul-transporting pleasure of obliging and being obliged! Blotted at once from existence, and the fair creation, he sinks into silence and oblivion, with all his sublime hopes disappointed, all his immense desires ungratified, and all his intellectual faculties unimproved. Without mentioning the instinctive horror which must attend such an action, how absurd to reason, and how inconsistent with the common feelings of humanity would it be to suppose a father capable of such a deed. Forbid it, God! forbid it, Nature! that we should impute to the munificent father of being and happiness, what, even in the lowest of rational creatures, would be monstrous and detestable!

(5) The truth is, that form which all mankind have deemed immortal, is so far from being the frailest, that it seems in fact the most indissoluble and permanent of any other we know. All the rational and inventive powers of the mind happily conspire to proclaim her infinitely different in nature, and superior in dignity to every possible modification of pure matter. Were mankind {65} joined in society, was life polished and cultivated, were the sciences and arts, not only of utility, but elegance, produced by matter? by a brute mass? A substance so contrary to all activity and intelligence, that it seems the work of an omnipotent hand alone to connect them. What judgement should we form of that principle which informed and enlightened a Galileo, a Copernicus, or a Newton? What inspiration taught them, to place the fun in the center of this system, and assign the various orbs their revolutions round him, reducing motions so diverse and unequal, to uniform and simple laws? Was it not something like that great eternal mind, which first gave existence to those luminous orbs, and prescribed each of them their province? Whence the infinite harmony and variety of sound, the copious flows of eloquence, the bolder graces and more inspired elevations of poetry, but from a mind, an immaterial being, the reflected image of her all-perfect Creator, in whom eternally dwells all beauty and excellence. Were man only endowed with a principle of vegetation, fixed to one peculiar spot, and insensible of all that passed around him; we might, then, with some colour, suppose that energy, if it may be so called, perishable. Were, he like animals possessed of mere vitality, and qualified only to move and feel, still we might have some reason to fear that, {66} in some future period of duration, our Creator might resume his gift of existence. but can any one, who pretends to the least reflection, imagine that such a being as the human soul, adorned with such extensive intellectual powers, will ever cease to be the object of that love and care which eternally holds the universe in its embrace? Did she obtain such a boundless understanding merely to taste the pleasure of exercising it? to catch a transient glance of its objects, and perish? Formed, as she is, to operate on herself, and all things round her, must she cease from action, while yet the mighty task is scarce begun? must she lose those faculties, by

which she retains the past, comprehends the presents and presages the future? must she contemplate no more those bright impressions of divinity, which are discovered in the material world; nor those stronger, and more animated features of the same eternal beauty which shine in her own god-like form? And must she be absorbed forever in the womb of unessential nothing? Strange, that in the view, and even in the arms of infinite power and goodness, a dawn so fair and promising, should at one be clouded with all the horrors of eternal night? Such a supposition would be contrary the whole conduct and laws of nature. {67}

The following Letters on SUICIDE *are extracted from* ROSSEAU's ELOISA.

LETTER CXIV. *To Lord B-------.*

YES, my Lord, I confess it; the weight of life is too heavy for my soul. I have long endured it as a burden; I have lost every thing which could make it dear to me, and nothing remains but irksomeness and vexation. I am told, however, that I am not at liberty to dispose of my life, without the permission of that Being from whom I received it. I am sensible likewise that you have a right over it by more titles than one. Your care has twice preserved it, and your goodness is its constant security. I will never {68} dispose of it, till I am certain that I may do it without a crime, and till I have not the least hope of employing it for your service.

You told me that I should be of use to you; why did you deceive me? Since we have been in London, so far from thinking of employing me in your concerns, you have been kind enough to make me your only concern. How superfluous is your obliging solicitude! My lord, you know I abhor a crime, even worse than I detest life; I adore the supreme Being -- I owe every thing to you; I have an affection for you; you are the only person on earth to whom I am attached. Friendship and duty may chain a wretch to this earth: sophistry and vain pretences will never detain him. Enlighten my understanding, speak to my heart; I am ready to hear you, but remember, that despair is not to be imposed upon.

You would have me apply to the test of reason: I will; let us reason. You desire me to deliberate in proportion to the importance {69} of the question in debate; I agree to it. Let us investigate truth with temper and moderation; let us discuss this general proposition with the same indifference we should treat any other. Roebeck wrote an apology for suicide before he put an end to his life. I will not, after his example, write a book on the subject, neither am I well satisfied with that which he has penned, but I hope in this discussion at least to imitate his moderation.

I have for a long time meditated on this awful subject. You must be sensible that I have, for you know my destiny, and yet I am alive. The more I reflect, the more I am convinced that the question may be reduced to this fundamental proposition. Every man has a right by nature to pursue what he thinks good, and avoid what he thinks evil, in all respects which are not injurious to others. When our life therefore becomes a misery to ourselves, and is of advantage to no one, we are at liberty to put an end to our being. If there is any such thing as a clear and self-evident {70} principle, certainly this is one, and if this be subverted, there is scarce an action in life which may not be made criminal.

Let us hear what the philosophers say on this subject. First, they consider life as something which is not our own, because we hold it as a gift; but because it has been given to us, is it for that reason our own? Has not God given these sophists two arms? nevertheless, when they are under apprehensions of a mortification, they do not scruple to amputate one, or both if there be occasion. By a parity of reasoning, we may convince those who believe in the immortality of the soul; for if I

sacrifice my arm to the preservation of something more precious, which is my body, I have the same right to sacrifice my body to the preservation of something more valuable, which is, the happiness of my existence. If all the gifts which heaven has bestowed are naturally designed for our good, they are certainly too apt to change their nature; and Providence has endowed us with reason, that we may discern the difference. If this rule {71} did not authorize us to chuse the one, and reject the other, to what use would it serve among mankind?

But they turn this weak objection into a thousand shapes. They consider a man living upon earth as a soldier placed on duty. God, say they, has fixed you in this world, why do you quit your station without his leave? But you, who argue thus, has he not stationed you in the town where you was born, why therefore do you quit it without his leave? is not misery, of itself, a sufficient permission? Whatever station Providence has assigned me, whether it be in a regiment, or on the earth at large, he intended me to stay there while I found my situation agreeable, and to leave it when it became intolerable. This is the voice of nature, and the voice of God. I agree that we must wait for an order; but when I die a natural death, God does not order me to quit life, he takes it from me; it is by rendering life insupportable, that he orders me to quit it. In the first case, I resist with all my force; in the second, I have the merit of obedience. {72}

Can you conceive that there are some people so absurd as to arraign suicide as a kind of rebellion against Providence, by an attempt to fly from his laws? but we do not put an end to our being in order to withdraw ourselves from his commands, but to execute them. What! does the power of God extend no farther than to my body? is there a spot in the universe, is there any being in the universe, which is not subject to his power, and will that power have less immediate influence over me when my being is refined, and thereby becomes less compound, and of nearer resemblance to the divine essence? no, his justice and goodness are the foundation of my hopes; and if I thought that death would withdraw me from his power, I would give up my resolution to die.

This is one of the quibbles of the Phaedo, which, in other respects, abounds with sublime truths. If your slave destroys himself, says Socrates to Cebes, would you not punish him, for having unjustly deprived you of your property; {73} prithee, good Socrates, do we not belong to God after we are dead? The case you put is not applicable; you ought to argue thus: if you incumber your slave with a habit which confines him from discharging his duty properly, will you punish him for quitting it, in order to render you better service? the grand error lies in making life of too great importance; as if our existence depended upon it, and that death was a total annihilation. Our life is of no consequence in the sight of God; it is of no importance in the eyes of reason, neither ought it to be of any in our sight; when we quit our body, we only lay aside an inconvenient habit. Is this circumstance so painful, to be the occasion of so much disturbance? My Lord, these declaimers are not in earnest. Their arguments are absurd and cruel, for they aggravate the supposed crime, as if it put a period to existence, and they punish it, as if that existence was eternal.

With respect to Plato's Phaedo, which has furnished them with the only specious argument that has ever been advanced, the question {74} is discussed there in a very light and desultory manner. Socrates being condemned, by an unjust judgment, to lose his life in a few hours, had no occasion to enter into an accurate enquiry whether he was at liberty to dispose of it himself. Supposing him really to have been the author of those discourses which Plato ascribes to him, yet believe me, my lord, he would have meditated with more attention on the subject, had he been in circumstances which required him to reduce his speculations to practice; and a strong proof that no valid objection can be drawn from that immortal work against the right of disposing of our own lives, is, that Cato read it twice through the very night that he destroyed himself.

The same sophisters make it a question whether life can ever be an evil? but when we consider the multitude of errors, torments, and vices, with which it abounds, one would rather be inclined to doubt whether it can ever be a blessing. Guilt incessantly besieges the most virtuous of mankind. Every moment he lives he is in danger of falling a prey to the wicked, or of being wicked himself. To {75} struggle and to endure, is his lot in this world; that of the dishonest man is to do evil, and to suffer. In every other particular they differ, and only agree in sharing the miseries of life in common. If you required authorities and facts, I could recite you the oracles of old, the answers of the sages, and produce instances where acts of virtue have been recompensed with death. But let us leave these considerations, my lord; it is to you whom I address myself, and I ask you what is the chief attention of a wise man in this life, except, if I may be allowed the expression, to collect himself inwardly, and endeavour, even while he lives, to be dead to every object of sense? The only way by which wisdom directs us to avoid the miseries of human nature, is it not to detach ourselves from all earthly objects, from every thing that is gross in our composition, to retire within ourselves, and to raise our thoughts to sublime contemplations? If therefore our misfortunes are derived from our passions and errors, with what eagerness should we wish for a state which will deliver us both from the one and the other? What is {76} the fate of those sons of sensuality, who indiscreetly multiply their torments by their pleasures? they in fact destroy their existence by extending their connections in this life; they increase the weight of their crimes by their numerous attachments; they relish no enjoyments, but what are succeeded by a thousand bitter wants; the more lively their sensibility, the more acute their sufferings; the stronger they are attached to life, the more wretched they become.

But admitting it, in general, a benefit to mankind to crawl upon the earth with gloomy sadness, I do not mean to intimate that the human race ought with one common consent to destroy themselves, and make the world one immense grave. But there are miserable beings, who are too much exalted to be governed by vulgar opinion; to them despair and grievous torments are the passports of nature. It would be as ridiculous to suppose that life can be a blessing to such men, as it was absurd in the sophister Possidonius to deny that is was an {77} evil, at the same time that he endured all the torments of the gout. While life is agreeable to us, we earnestly wish to prolong it, and nothing but a sense of extreme misery can extinguish the desire of existence; for we naturally conceive a violent dread of death, and this dread conceals the miseries of human nature from our sight. We drag a painful and melancholy life, for a long time before we can resolve to quit it; but when once life becomes so insupportable as to overcome the horror of death, then existence is evidently a great evil, and we cannot disengage ourselves from it too soon. Therefore, though we cannot exactly ascertain the point at which it ceases to be a blessing, yet at least we are certain in that it is an evil long before it appears to be such, and with every sensible man the right of quitting life is, by a great deal, precedent to the temptation.

This is not all. After they have denied that life can be an evil, in order to bar our right of making away with ourselves; they confess immediately afterwards that it is an {78} evil, by reproaching us with want of courage to support it. According to them, it is cowardice to withdraw ourselves from pain and trouble, and there are none but dastards who destroy themselves. O Rome, thou victrix of the world, what a race of cowards did thy empire produce! Let Arria, Eponina, Lucretia, be of the number; they were women. But Brutus, Cassius, and thou great and divine Cato, who didst share with the gods the adoration of an astonished world, thou whose sacred and august presence animated the Romans with holy zeal, and made tyrants tremble, little did thy proud admirers imagine that paltry rhetoricians, immured in the dusty corner of a college, would ever attempt to

prove that thou wert a coward, for having preferred death to a shameful existence.

O the dignity and energy of your modern writers! How sublime, how intrepid are you with your pens? but tell me, thou great and valiant hero, who dost so courageously decline the battle, in order to endure the pain of living somewhat longer; when spark of fire {79} lights upon your hand, why do you withdraw it in such haste? how? are you such a coward that you dare not bear the scorching of fire? nothing, you say, can oblige you to endure the burning spark; and what obliges me to endure life? was the creation of a man of more difficulty to Providence, than that of a straw? and is not both one and the other equally the work of his hands?

Without doubt, it is an evidence of great fortitude to bear with firmness the misery which we cannot shun; none but a fool, however, will voluntarily endure evils which he can avoid without a crime; and it is very often a great crime to suffer pain unnecessarily. He who has not resolution to deliver himself from a miserable being by a speedy death, is like one who would rather suffer a wound to mortify, than trust to a surgeon's knife for his cure. Come, thou worthy -- cut off this leg, which endangers my life. I will see it done without shrinking, and will give that hero leave to call me coward, who suffers his leg to mortify, because he dares not undergo the same operation. {80}

I acknowledge that there are duties owing to others, the nature of which will not allow every man to dispose of his life; but, in return, how many are there which give him a right to dispose of it? let a magistrate on whom the welfare of a nation depends, let a father of a family who is bound to procure subsistence for his children, let a debtor who might ruin his creditors, let these at all events discharge their duty; admitting a thousand other civil and domestic relations to oblige an honest and unfortunate man to support the misery of life, to avoid the greater evil of doing injustice; is it, therefore, under circumstances totally different, incumbent on us to preserve a life oppressed with a swarm of miseries, when it can be of no service but to him who has not courage to die? "Kill me, my child," says the decrepid savage to his son, who carries him on his shoulders, and bends under his weight; the "enemy is at hand; go to battle with thy brethren; go and preserve thy children, and do not suffer thy helpless father to fall {81} alive into the hands of those whose relations he has mangled." Though hunger, sickness, and poverty, those domestic plagues, more dreadful than savage enemies, may allow a wretched cripple to consume, in a sick bed, the provisions of a family which can scarce subsist itself, yet he who has no connections, whom heaven has reduced to the necessity of living alone, whose wretched existence can produce no good, why should not he, at least, have the right of quitting a station, where his complaints are troublesome, and his sufferings of no benefit?

Weigh these considerations, my lord; collect these arguments, and you will find that they may be reduced to the most simple of nature's rights, of which no man of sense ever yet entertained a doubt. In fact, why should we be allowed to cure ourselves of the gout, and not to get rid of the misery of life? do not both evils proceed from the same hand? to what purpose is it to say, that death is painful? are drugs agreeable to be taken? no, nature revolts against both. Let them prove therefore {82} that it is more justifiable to cure a transient disorder by the application of remedies, than to free ourselves from an incurable evil by putting an end to our life; and let them shew how it can be less criminal to use the bark for a fever, than to take opium for the stone. If we consider the object in view, it is in both cases to free ourselves from painful sensations; if we regard the means, both one and the other are equally natural; if we consider the repugnance of our nature, it operates equally on both sides; if we attend to the will of providence, can we struggle against any evil of which it is not the author can we deliver ourselves from any torment which the hand of God has not inflicted? what are the bounds which limit his power, and when resistance lawful? are we then

to make no alteration in the condition of things, because every thing is in the state he appointed? must we do nothing in this life, for fear of infringing his laws, or is it in our power to break them if we would? no, my lord, the occupation of man is more great and noble. God did not give him life that he should supinely {83} remain in a state of constant inactivity. But he gave him freedom to act, conscience to will, and reason to choose what is good. He has constituted him sole judge of all his actions. He has engraved this precept in his heart, Do whatever you conceive to be for your own good, provided you thereby do no injury to others. If my sensations tell me that death is eligible, I resist his orders by an obstinate resolution to live; for, by making death desirable, he directs me to put an end to my being.

My lord, I appeal to your wisdom and candour; what more infallible maxims can reason deduce from religion, with respect to suicide? If Christians have adopted contrary tenets, they are neither drawn from the principles of religion, nor from the only sure guide, the Scriptures, but borrowed from the Pagan philosophers. Lactantius and Augustine, the first who propagated this new doctrine, of which Jesus Christ and his apostles take no notice, ground their arguments entirely on the reasoning of Phaedo, which I have already {84} controverted; so that the believers, who, in this respect, think they are supported by the authority of the Gospel, are in fact only countenanced by the authority of Plato. In truth, where do we find, throughout the whole bible any law against suicide, or so much as a bare disapprobation of it; and is it not very unaccountable, that among the instances produced of persons who devoted themselves to death, we do not find the least word of improbation against examples of this kind? nay, what is more, the instance of Samson's voluntary death is authorized by a miracle, by which he revenges himself of his enemies. Would this miracle have been displayed to justify a crime; and would this man, who lost his strength by suffering himself to be seduced by the allurements of a woman, have recovered it to commit an authorised crime, as if God himself would practice deceit on men?

Thou shalt do no murder, says the decalogue; what are we to infer from this? if this commandment is to be taken literally, we {85} must not destroy malefactors, nor our enemies: and Moses, who put so many people to death, was a bad interpreter of his own precept. If there are any exceptions, certainly the first must be in favour of suicide, because it is exempt from any degree of violence and injustice, the two only circumstances which can make homicide criminal; and because nature, moreover, has, in this respect, thrown sufficient obstacles in the way.

But still they tell us, we must patiently endure the evils which God inflicts, and make a merit of our sufferings. This application however of the maxims of Christianity, is very ill calculated to satisfy our judgment. Man is subject to a thousand troubles, his life is a complication of evils, and he seems to have been born only to suffer. Reason directs him to shun as many of these evils as he can avoid; and religion, which is never in contradiction to reason, approves of his endeavours. But how inconsiderable is the account of these evils, in comparison with those he is obliged to endure against his will? It is with {86} respect to these, that a merciful God allows man to claim the merit of resistance; he receives the tribute he has been pleased to impose, as a voluntary homage, and he places our resignation in this life to our profit in the next. True repentance is derived from nature; if man endures whatever he is obliged to suffer, he does, in this respect, all that God requires of him; and if any one is so inflated with pride, as to attempt more, he is a madman, who ought to be confined, or an impostor, who ought to be punished. Let us, therefore, without scruple, fly from all the evils we can avoid; there will still be too many left for us to endure. Let us, without remorse, quit life itself when it becomes a torment to us, since it is in our own power to do it, and that in so doing we neither offend God nor man. If we would offer a sacrifice to the supreme Being, is it

nothing to undergo death? let us devote to God that which he demands by the voice of reason, and into his hands let us peaceably surrender our souls.

Such are the liberal precepts which good {87} sense dictates to every man, and which religion authorises.[9] Let us apply these precepts to ourselves. You have condescended to disclose your mind to me; I am acquainted with your uneasiness; you do not endure less than myself; and your troubles, like mine, are incurable; and they are the more remediless, {88} as the laws of honour are more immutable than those of fortune. You bear them, I must confess, with fortitude. Virtue supports you; advance but one step farther, and she disengages you. You intreat me to suffer; my lord, I dare importune you to put an end to your sufferings; and I leave you to judge which of us is most dear to the other.

Why should we delay doing that which we must do at last? shall we wait till old age and decrepid baseness attach us to life, after they have robbed it of its charms, and till we are doomed to drag an infirm and decrepid body with labour, and ignominy, and pain? We are at an age when the soul has vigour to disengage itself with ease from its shackles, and when a man knows how to die as he ought; when farther advanced in years, he suffers himself to be torn from life, which he quits with reluctance. Let us take advantage of this time, when the tedium of life makes death desirable; and let us tremble for fear it should come in all its horrors, at the moment when we could wish to avoid it. I remember {89} the time, when I prayed to heaven only for a single hour of life, and when I should have died in despair if it had not been granted. Ah! what a pain it is to burst asunder the ties which attach our hearts to this world, and how advisable it is to quit life the moment the connection is broken! I am sensible, my lord, that we are both worthy of a purer mansion; virtue points it out, and destiny invites us to seek it. May the friendship which invites us preserve our union to the latest hour! O what a pleasure for two sincere friends voluntary to end their days in each others arms, to intermingle their latest breath, and at the same instant to give up the soul which they shared in common! What pain, what regret can infect their last moments? What do they quit by taking leave of the world? They go together; they quit nothing. {90}

LETTER CXV. ANSWER.

THOU art distracted, my friend, by a fatal passion; be more discreet; do not give counsel, whilst thou standest so much in need of advice. I have known greater evils than yours. I am armed with fortitude of mind; I am an Englishman, and not afraid to die; but I know how to live and suffer as becomes a man. I have seen death near at hand, and have viewed it with too much indifference to go in search of it.

It is true, I thought you might be of use to me; my affection stood in need of yours: your endeavours might have been serviceable to me; your understanding might have enlightened me in the most important concern of my life; if I do not avail myself of it, who are you to impute it to? Where is it? What {91} is become of it? What are you capable of? Of what use can you be in your present condition? What service can I expect from you? A senseless grief renders you stupid and unconcerned. Thou art no man; thou art nothing; and if I did not consider what thou mightest be, I cannot conceive any thing more abject.

There is need of no other proof than your letter itself. Formerly I could discover in you good sense and truth. Your sentiments were just, your reflections proper, and I liked you not only from judgment but choice; for I considered your influence as an additional motive to excite me to the study of wisdom. But what do I perceive now in the arguments of your letter, with which you

appear to be so highly satisfied? A wretched and perpetual sophistry, which in the erroneous deviations of your reason shews the disorder of your mind, and which I would not stoop to refute, if I did not commiserate your delirium. {92}

To subvert all your reasoning with one word, I would only ask you a single question. You who believe in the existence of a God, in the immortality of the soul, and in the freewill of man, you surely cannot suppose that an intelligent being is embodied, and stationed on the earth by accident only, to exist, to suffer, and to die. It is certainly most probable that the life of man is not without some design, some end, some moral object. I intreat you to give me a direct answer to this point; after which we will deliberately examine your letter, and you will blush to have written it.

But let us wave all general maxims, about which we often hold violent disputes, without adopting any of them in practice; for in their applications we always find some particular circumstances which makes such an alteration in the state of things, that every one thinks himself dispensed from submitting to the rules which he prescribes to others; and it is well known, that every man who establishes {93} general principles deems them obligatory on all the world, himself excepted. Once more let us speak to you in particular.

You believe that you have a right to put an end to your being. Your proof is of a very singular nature; "because I am disposed to die, say you, I have a right to destroy myself." This is certainly a very convenient argument for villains of all kinds: they ought to be very thankful to you for the arms with which you have furnished them; there can be no crimes, which, according to your arguments, may not be justified by the temptation to perpetrate them; and as soon as the impetuosity of passion shall prevail over the horror of guilt, their disposition to do evil will be considered as a right to commit it.

Is it lawful for you therefore to quit life? I should be glad to know whether you have yet begun to live? what! was you placed here on earth to do nothing in this world? did not heaven when it gave you existence give you some task or employment? If you have {94} accomplished your day's work before evening, rest yourself for the remainder of the day; you have a right to do it; but let us see your work. What answer are you prepared to make the supreme Judge, when he demands an account of your time? Tell me, what can you say to him? -- I have seduced a virtuous girl: I have forsaken a friend in distress. Thou unhappy wretch! point out to me that just man who can boast that he has lived long enough; let me learn from him in what manner I ought to have spent my days to be at liberty to quit life.

You enumerate the evils of human nature. You are not ashamed to exhaust common-place topics, which have been hackneyed over a hundred times; and you conclude that life is an evil. But search, examine into the order of things, and see whether you can find any good which is not intermingled with evil. Does it therefore follow that there is no good in the universe, and can you confound what is in its own nature evil, with that which is only an evil accidentally? You have {95} confessed yourself, that the transitory and passive life of man is of no consequence, and only bears respect to matter from which he will soon be disencumbered; but his active and moral life, which ought to have most influence over his nature, consists in the exercise of free-will. Life is an evil to a wicked man in prosperity, and a blessing to an honest man in distress: for it is not its casual modification, but its relation to some final object which makes it either good or bad. After all, what are these cruel torments which force you to abandon life? do you imagine, that under your affected impartiality in the enumeration of the evils of this life, I did not discover that you was ashamed to speak of your own? Trust me, and do not at once abandon every virtue. Preserve at least your

wonted sincerity, and speak thus openly to your friend; "I have lost all hope of seducing a modest woman, I am oliged therefore to be a man of virtue; I had much rather die."

You are weary of living; and you tell me, that life is an evil. Sooner or later you will {96} receive consolation, and then you will say life is a blessing. You will speak with more truth, though not with better reason; for nothing will have altered but yourself. Begin the alteration then from this day; and, since all the evil you lament is in the disposition of your mind, correct your irregular appetites, and do not set your house on fire to avoid the trouble of putting it in order.

I endure misery, say you: Is it in my power to avoid suffering? But this is changing the state of the question: for the subject of enquiry is, not whether you suffer, but whether your life is an evil? Let us proceed. You are wretched, you naturally endeavour to extricate yourself from misery. Let us see whether, for that purpose, it is necessary to die.

Let us for a moment examine the natural tendency of the afflictions of the mind, as in direct opposition to the evils of the body, the two substances being of contrary nature. The latter become worse and more inveterate the {97} longer they continue, and at length utterly destroy this mortal machine. The former, on the contrary, being only external and transitory modifications of an immortal and uncompounded essence, are insensibly effaced, and leave the mind in its original form, which is not susceptible of alteration. Grief, disquietude, regret, and despair, are evils of short duration, which never take root in the mind; and experience always falsifies that bitter reflection, which makes us imagine our misery will have no end. I will go farther; I cannot imagine that the vices which contaminate us, are more inherent in our nature than the troubles we endure; I not only believe that they perish with the body which gives them birth, but I think, beyond all doubt, that a longer life would be sufficient to reform mankind, and that many ages of youth would teach us that nothing is preferable to virtue.

However this may be, as the greatest part of our physical evils are incessantly encreasing, the acute pains of the body, when they are incurable, may justify a man's destroying himself; {98} for all his faculties being distracted with pain, and the evil being without remedy, he has no longer any use either of his will or of his reason; he ceases to be a man before he is dead, and does nothing more in taking away his life, than quit a body which incumbers him, and in which his soul is no longer resident.

But it is otherwise with the afflictions of the mind, which, let them be ever so acute, always carry their remedy with them. In fact, what is it that makes any evil intolerable? Nothing but its duration. The operations of surgery are generally much more painful than the disorders they cure; but the pain occasioned by the latter is lasting, that of the operation is momentary, and therefore preferable. What occasion is there therefore for any operation to remove troubles which die of course by their duration, the only circumstance which could render them insupportable? Is it reasonable to apply such desperate remedies to evils which expire of themselves? To a man who values himself on his fortitude, {99} and who estimates years at their real value, of two ways by which he may extricate himself from the same troubles, which will appear preferable, death or time? Have patience, and you will be cured. What would you desire more?

Oh! you will say, it doubles my afflictions to reflect that they will cease at last! This is the vain sophistry of grief! an apophthegm void of reason, of propriety, and perhaps of sincerity. What an absurd motive of despair is the hope of terminating misery![10] Even allowing this fantastical reflection, who would not chuse to encrease the present pain for a moment, under the assurance of putting an end to it, as we scarify a wound in order to heal it? and admitting any charm in grief, to

make us in love with suffering, {100} when we release ourselves from it by putting an end to our being, do we not at that instant incur all that we apprehend hereafter?

Reflect thoroughly, young man; what are ten, twenty, thirty years, in competition with immortality? Pain and pleasure pass like a shadow; life slides away in an instant; it is nothing of itself; its value depends on the use we make of it. The good that we have done is all that remains, and it is that alone which marks its importance.

Therefore do not say any more that your existence is an evil, since it depends upon yourself to make it a blessing; and if it be an evil to have lived, this is an additional reason for prolonging life. Do not pretend neither to say any more that you are at liberty to die; for it is as much as to say that you have power to alter your nature, that you have a right to revolt against the author of your being, and to frustrate the end of your existence. But when you add, that your death does injury to {101} no one, do you recollect that you make this declaration to your friend?

Your death does injury to no one? I understand you! You think the loss I shall sustain by your death of no importance; you deem my affliction of no consequence. I will urge to you no more the rights of friendship, which you despise; but are there not obligations still more dear,[11] which ought to induce you to preserve your life? If there be a person in the world who loved you to that degree as to be unwilling to survive you, and whose happiness depends on yours, do you think that you have no obligations to her? Will not the execution of your wicked design disturb the peace of a mind, which has been with such difficulty restored to its former innocence? Are not you afraid to add fresh torments to a heart of such sensibility? Are not you apprehensive left your death should be attended {102} with a loss more fatal, which would deprive the world and virtue itself of its brightest ornament? And if she should survive you, are not you afraid to rouse up remorse in her bosom, which is more grievous to support than life itself? Thou ungrateful friend! thou indelicate lover! wilt thou always be taken up wholly with thyself? Wilt thou always think on thy own troubles alone? Hast thou no regard for the happiness of one who was so dear to thee? and cannot thou resolve to live for her who was willing to die with thee?

You talk of the duties of a magistrate, and of a father of a family: and because you are not under those circumstances, you think yourself absolutely free. And are you then under no obligations to society, to whom you are indebted for your preservation, your talents, your understanding? do you owe nothing to your native country, and to those unhappy people who may need your existence! O what an accurate calculation you make! among the obligations you have enumerated, {103} you have only omitted those of a man and of a citizen. Where is the virtuous patriot, who refused to enlist under a foreign prince, because his blood ought not to be split but in the service of his country; and who now, in a fit of despair, is ready to shed it against the express prohibition of the laws? The laws, the laws, young man! did any wise man ever despise them? Socrates, though innocent, out of regard to them refused to quit his prison. You do not scruple to violate them by quitting life unjustly; and you ask, what injury do I?

You endeavour to justify yourself by example. You presume to mention the Romans: you talk of the Romans! it becomes you indeed to cite those illustrious names. Tell me, did Brutus die a lover in despair, and did Cato plunge the dagger in his breast for his mistress? Thou weak and abject man! what resemblance is there between Cato and thee? Shew me the common standard between that sublime soul and thine. Ah vain wretch! hold thy peace: I am afraid to profane {104} his name by a vindication of his conduct. At that august and sacred name every friend to virtue should bow to the ground, and honour the memory of the greatest hero in silence.

How ill you have selected your examples, and how meanly you judge of the Romans, if you imagine that they thought themselves at liberty to quit life so soon as it became a burden to them. Recur to the excellent days of that republic, and seen whether you will find a single citizen of virtue, who thus freed himself from the discharge of his duty even after the most cruel misfortunes. When Regulus was on his return to Carthage, did he prevent the torments which he knew were preparing for him by destroying himself? What would not Posthumus have given, when obliged to pass under the yoke at Caudium, had this resource been justifiable? How much did even the senate admire that effort of courage, which enabled the consul Varro to survive his defeat? For what reason did so many generals voluntary surrender themselves to their enemies, they to whom ignominy was so dreadful, {105} and who were so little afraid of dying? It was because they considered their blood, their life, and their latest breath, as devoted to their country; and neither shame nor misfortune could dissuade them from this sacred duty. But when the laws were subverted, and the state became a prey to tyranny, the citizens resumed their natural liberty, and the right they had over their own lives. When Rome was no more, it was lawful for the Romans to give up their lives; they had discharged their duties on earth, they had no longer any country to defend, they were therefore at liberty to dispose of their lives, and to obtain that freedom for themselves which they could not recover for their country. After having spent their days in the service of expiring Rome, and in fighting for the defence of its laws, they died great virtuous as they had lived, and their death was an additional tribute to the glory of the Roman name, since none of them beheld a fight above all others most dishonourable, that of a true citizen stooping to an usurper. {106}

But thou, what art thou? what hast thou done? dost thou think to excuse thyself on account of thy obscurity? does thy weakness exempt thee from thy duty, and because thou hast neither rank nor distinction in thy country, art thou less subject to the laws? It becomes you vastly to presume to talk of dying while you owe the service of your life to your equals. Know, that a death, such as you meditate, is shameful and surreptitious. It is a theft committed on mankind in general. Before you quit life, return the benefits you have received from every individual. But, say you, I have no attachments; I am useless in the world. O thou young philosopher! art thou ignorant that thou canst not more a single step without finding some duty to fulfil; and that every man is useful to society, even by means of his existence alone?

Hear me, thou rash young man! thou art dear to me. I commiserate thy errors. If the least sense of virtue still remains in thy breast, attend, and let me teach thee to be reconciled {107} to life. Whenever thou art tempted to quit, say to thyself -- "Let me do at least one good action before I die." Then go in search for one in a state of indigence, whom thou mayest relieve; for one under misfortunes, whom thou mayest comfort; for one under oppression, whom thou mayest defend. Introduce to me those unhappy wretches whom my rank keeps at a distance. Do not be afraid of misusing my purse, or my credit: make free with them; distribute my fortune; make me rich. If this consideration restrains you to-day, it will restrain you to-morrow; if no to morrow, it will restrain you all your life. If it has no power to restrain you, die! you are below my care.

FINIS.

Notes

[2]De Divin. lib. ii.

[3]Agamus Die Gratias, quad nemo in vita teneri potest. SEN. Epist. 12.

[4]TACIT. Ann. lib i.

[5]IT would be easy to prove that suicide is as lawful under the Christian dispensation as it was to the Heathens. There is not a single text of scripture which prohibits it. That great and infallible rule of faith and practice which must controul all philosophy and human reasoning, has left us in this particular to our natural liberty. Resignation to Providence is indeed recommended in scripture; but that implies only submission to ills that are unavoidable, not to such as may be remedied by prudence or courage. *Thou shalt not kill*, is evidently meant to exclude only the killing of others, over whose life we have no authority. That this precept, like most of the scripture precepts, must be modified by reason and common sense, is plain from the practice of magistrates, who punish criminals capitally, notwithstanding the letter of the law. But were this commandment ever so express against suicide, it would now have no authority, for all the law of *Moses* is abolished, except so far as it is established by the law of nature. And we have already endeavoured to prove that suicide is not prohibited by that law. In all cases Christians and Heathens are precisely upon the same footing; *Cato* and *Brutus*, *Arrea* and *Portia* acted heroically; those who now imitate their example ought to receive the same praises from posterity. The power of committing suicide is regarded by *Pliny* as an advantage which men possess even above the Deity himself. "Deus non sibi potest mortem consciscere si velit quod homini dedit optimum in tantis vitae paenis." Lib. II. Cap. 7. ([editor's note] 5)

[6]Quint. Curtius lib. VI. cap. 5.

[7]Suet. Augus. cap. 3.

[8]Lib. 7. cap. 55.

[9]A strange letter this for the discussion of such a subject! Do men argue so cooly on a question of this nature, when they examine it on their own accounts? Is the letter a forgery, or does the author reason only with an intent to be refuted? What makes our opinion in this particular dubious, is the example of Robeck, which he cites, and which seems to warrant his own. Robeck deliberated so gravely that he had patience to write a book, a large, voluminous, weighty, and dispassionate book; and when he had concluded, according to his principles, that it was lawful to put an end to our being, he destroyed himself with the same composure that he wrote. Let us beware of the prejudices of the times, and of particular countries. When suicide is out of fashion we conclude that none but madmen destroy themselves; and all the efforts of courage appear chimerical to dastardly minds; every one judges of others by himself. Nevertheless, how many instances are there, well attested, of men, in every other respect perfectly discreet, who, without remorse, rage, or despair, have quitted life for no other reason than because it was a burden to them, and have died with more composure than they lived?

[10]No, my lord, we do not put an end to misery by these means, but rather fill the measure of affliction, by bursting asunder the last ties which attach us to felicity. When we regret what was dear to us, grief itself still attaches us to the object we lament, which is a state less deplorable than to be attached to nothing.

[11]Obligations more dear than those of friendship! Is it a philosopher who talks thus? But this affected sophist was of an amorous disposition.

Review of Hume's *A Treatise Of Human Nature*

The History of The Works of the Learned

November-December 1739

Editor's Note: This review appeared anonymously in 1739, Volume 2 of *The History of the Works of the Learned*. The review was published in two parts, starting in the November issue (pp. 353-390), and concluding in the December issue (pp. 391-404). The review covers only Volume 1 of Hume's *Treatise*, in spite of the reviewer's suggestion that Volume 2 might also be reviewed at a later time.

The History of the Works of the Learned November and December 1739 Vol. 2, pp. 353-404

{353}

ARTICLE XXVI

***A Treatise of* HUMAN NATURE: *Being an Attempt to introduce the experimental Method of Reasoning into Moral Subjects*. London: *Printed for* John-Noon, *at the* White Hart, *near* Mercer-Chapel, Cheapside, 1739. Vol. II. Octavo. Pages 475-318.**

I Do not recollect any Writer in the *English* Language who has framed a System of human Nature, morally considered, upon the Principle of this Author, which is that of Necessity, in Opposition to Liberty or Freedom. The Truth of the Principle itself has been often and very carefully discussed. Some have endeavoured to prove even the Impossibility of Liberty, while others have asserted it to be an essential Property of human Nature, the Basis of all Morality, Religion and happiness, which

can subsist upon no other Foundation, and are utterly subverted by the Denial of it. To form the clearest Ideas we can have upon this abstruse Subject, we should read some Letters that passed thereupon between those tow acute Reasoners, Mr. *Locke* and Mr. *Limborch*, and the incomparable Dr. *Clarke*'s Answers to several Pieces of *Leibnitz* and *Collins*.

Our Author has sufficiently (he says) explained the Design of this Work of his in the Introduction. Perhaps he expects we should understand it by the following Passages.

> **It is evident, that all the sciences have Relation, greater or less, to human Nature; and that however wide any of them may seem to run from it, they still return back by one Passage or another. Even *Mathematicks*, *Natural Philosophy*, and *Natural Religion*, are in {354} some measure dependent on the Science of MAN; since they lie under the Cognizance of Men, and are judged of by their Powers and Faculties. It is impossible to tell what Changes and Improvements we might make in these Sciences, were we thoroughly acquainted with the Extent and Force of human Understanding, and could explain the Nature of the Ideas we employ, and of the Operations we perform in our Reasonings. And these improvements are the more to be hoped for in natural Religion, as it is not content with instructing us in the Nature of superior Powers but carries its Views farther, to their Disposition towards us and our Duties towards them, and consequently we ourselves are not only the Beings that reason, but also one of the Objects concerning which we reason.**

If therefore the Sciences of Mathematicks, Natural Philosophy, and Natural Religion, have such a Dependence on the Knowledge of Man, what may be expected in the other Sciences whose Connexion with human Nature is more close and intimate? The sole End of Logick is to explain the Principles and Operations of our reasoning Faculty, and the Nature of our Ideas: Morals and Criticism regard our Tastes and Sentiments; and Politicks consider Men as united in Society, and dependent on each other. In these four Sciences of *Logick*, *Morals*, *Criticism* and *Politicks*, is comprehended almost every thing which can any way import us to be acquainted with. --

Here then is the only Expedient from which we can hope for Success in our philosophical Researches, to leave the tedious lingering Method which we have hitherto followed; and instead of taking no and then a Castle or Village on the Frontier, to march directly to the Capital or Center {355} of these Sciences, to human Nature itself; which being once Masters of we may every where else hope for an easy Victory. -- There is no Question of Importance, whose Decision is not comprized in the Science of Man; and there is none which can be decided with any Certainty, before we become acquainted with that Science. *In pretending therefore to explain the Principles of human Nature, we in effect propose a compleat System of the Sciences, built on a Foundation almost entirely new, and the only one upon which they can stand with any Security*.

And as the Science of Man is the only solid Foundation for the other Sciences, so the only solid Foundation we can give to this Science itself, must be laid on Experience and Observation. -- For it seems evident, that the Essence of the Mind being equally unknown to us with that of external Bodies, it must be equally impossible to form any Notions of its Powers and Qualities, otherwise than from careful and exact Experiments, and the Observation of those particular Effects which result from its different Circumstances and Situations. --

Moral Philosophy has indeed this peculiar Disadvantage, which is not found in natural; that, in collecting its Experiments, it cannot make them purposely, with Premeditation, and after such a manner, as to satisfy itself concerning every particular Difficulty which may arise. When we are at

a loss to know the Effects of one Body upon another, we need only put them in that Situation, and observe what results from it. But should we endeavour to clear up after the same manner any Doubt in moral Philosophy, by placing ourselves in the same Case with that which we consider, it is evident this Reflection and Premeditation would so disturb the Operation {356} of our natural Principles, as must render it impossible to form any just Conclusion from the Pho^enomenon. We must therefore glean up our Experiments in this Science from a cautious Observation of human Life, and take them as they appear in the common Course of the World, by Mens Behaviour in Company, in Affairs, and in their Pleasures. Where Experiments of this kind are judiciously collected and compared, we may hope to establish on them a Science, which will not be inferior in Certainty, and will be much superior in Utility, to any other of human Comprehension.

Here the Reader has all that I can find in the Introduction to this Work, which can in the least give him any Idea of the Design of it: How far he will be thereby instructed in it, must be left to his own Judgment: I go on to set before him the several Topicks therein treated of. The Understanding is the Subject of the first Book, or Volume which is by much the largest. In the second Book, or Volume, the Passions are considered. The former of these Books is divided into four Parts. In the first, the Doctrine of Ideas is delivered; accounting for their Origin, and describing their Composition, Connexion and Abstraction. I shall offer a short Hint of what he has said upon these different Heads.

To trace the Origin of our Ideas, he resolves all the Perceptions of the human Mind into two Kinds, which may be called *Impressions* and *Ideas*,[2] He {357} makes the Difference betwixt these to consist in the Degrees and Force and Liveliness, with which they strike the perceiving Faculty. Those that enter with the most Violence, he calls *Impressions*; and under this Name he comprehends all our Sensations, Passions and Emotions, as they make their first Appearance in the Soul: By *Ideas*, he means the faint Images of these in Thinking and Reasoning. -- There is another Division of our Perceptions whereof he takes notice, and which extends itself both to our Impressions and Ideas: This is into *simple* and *complex*.

Having by these Divisions given an Order and Arrangement to his Objects, (that is, I suppose, Ideas) we may now, he says, with the more Accuracy considered their Qualities and Relations. The first Circumstance that strikes his Eye,[3] is the great Resemblance betwixt our Impressions and Ideas in every Particular, except their Degree of Force and Vivacity. When he shuts his Eyes and thinks of his Chamber, the Ideas he forms are exact Representations (he tells us) of the Impressions he felt. I fancy most other People have made the same Observations. However, this Circumstance seems to our Author remarkable, and engages his Attention for a Moment.

Having finished his Meditations on this Point, and discovered this Relation between Impressions and Ideas, which, he says, requires no farther Examination, he is curious to find some other of their Qualities. He proceeds therefore to consider how they stand with regard to their existence, and which of the Impressions and Ideas are Causes, and {358} which Effects. The full Examination of this Question is, he tells us, the Subject of this Performance of his; and therefore he here contents himself with establishing this one general Proposition, *That all our simple Ideas in their first Appearance are derived from simple Impressions, which are correspondent to them, and which they exactly represent.* When he has fixed this Assertion beyond Contradiction, he reflects on what he has done with great Satisfactions; saying,

> **This then is the first Principle I establish in the Science of human Nature, nor ought we to despise it because of the Simplicity of its Appearance. For it is remarkable, that the**

> present Question is the same with what has made so much Noise in the Terms, when it has been disputed whether there be any *innate Ideas*, or whether all Ideas be derived from Sensations and Reflexion. We may observe, that in order to prove the Ideas of Extension and Colour not to be innate, Philosophers do nothing but shew, that they are conveyed by our Senses. To prove the Ideas of Passion and Desire not to be innate, they observe that we have a preceding Experience of these Emotions in ourselves. Now if we carefully examine these Arguments, we shall find that they prove nothing, but that Ideas are preceded by other more lively Perceptions from which they are derived, and which they represent."

See what an extraordinary Light our Author, by tow or three Arguments, has cast upon a Point, which cost Mr. *Locke*, and some other eminent Philosophers, no little Pains in settling.

> Accordingly he hopes his clear stating of the Question will remove all Disputes concerning it, and will render the abovesaid Principle of more use in our Reasonings, than it seems hitherto to have been. {359}

And now having made it appear, that our simple Impressions are prior to their correspondent Ideas, a very few Instances excepted, Method seems, our author says, to require we should examine our Impressions, before we consider our Ideas. But after informing us that Impressions may be divided into two kinds, those of *Sensation* and those of *Reflexion*, and briefly illustrating both sorts, he gives us to understand, that it will be necessary to reverse that Method, which at first Sight seems most natural; and, in order to explain the Nature and Principles of the human Mind, give a particular Account of Ideas, before we proceed to Impressions.

In Pursuance of this Resolution, he goes on: First, to describe and distinguish the Ideas of the Memory and Imagination: Secondly, to explain the Connexion or Association of Ideas: Thirdly, to assign their several other Relations: Fourthly, to define and fix the true Essence of Modes and Substances: And Fifthly, to determine the Nature of abstract Ideas. On all these heads, a Man, who has never had the Pleasure of reading Mr. *Locke*'s incomparable Essay, will peruse our Author with much less Disgust, than those can who have been used to the irresistible Reasoning and wonderful Perspicuity of that admirable Writer.

To pass over the other Topicks, let us transiently view our Author's Discourse on *abstracted Ideas*, which fills up the seventh Section of the first Part of his Work. He begins,

> A very material Question has been started concerning *abstract* or *general* Ideas, *whether they be general or particular in the Mind's Conception of them*."[4]

Then he tells us {360} that Dr. *Berkeley* has disputed the received Opinion in this Particular, and has asserted, *that all general Ideas are nothing but particular ones, annexed to a certain Term, which gives them a more extensive Signification, and makes them recall upon Occasion other individuals which are similar to them*. This, agreeable to his Sagacity, he looks upon as one of the greatest and most valuable Discoveries that has been made of late Years in the Republick of Letters; and so he sets himself to confirm it by some Arguments, which, in his Apprehension, will put it beyond all Doubt and Controversy.

It is above twenty Years since I looked over that Piece of Dr. *Berkeley*'s, which contains this most precious Discovery, and, if I remember right, that Gentleman himself boasts of some might Advantages that would accrue from it to the Commonwealth of Learning: The Acquisition of Science was to become exceeding easy, and several Difficulties, that were used grievously to perplex Mathematicians and Metaphysicians, were to sink before it: In short, it was to do such Feats in

behalf of Knowledge, as no Principle beside was able to perform. But notwithstanding all these Benefits that were to accompany it, I do not find it has met with any favourable Reception among the Literati; or that many Persons of Ability and Penetration are become Disciples: Its Fortune may now perhaps be more prosperous under the Auspices of its new Patron, who, we see, undertakes to raise it above all Opposition.

It is evident, he says, that in forming most of our general Ideas, if not all of them, we abstract from every particular Degree of Quantity and Quality, and that an Object ceases not to be of any particular Species on account of every small Alteration in its Extension, Duration, and other Properties. It may therefore be thought, that {361} here is a plain Dilemma that decides concerning the Nature of those abstract Ideas which have afforded so much Speculation to Philosophers. The abstract Idea of a Man represents Men of all Sizes and all Qualities; which it is concluded it cannot do, but either *by representing at once all possible Sizes and all possible Qualities, or by representing no particular one at all*. Now it having been esteemed absurd to defend the former Proposition, as implying an infinite Capacity in the Mind, it has been commonly infer'd in favour of the latter.

Here is the Dilemma with which we are perplexed on this Subject, and from which the superior Capacity of our Author is to deliver us. The latter Inference he utterly destroys. And this he does, first, by proving that it is utterly impossible to conceive any Quantity or Quality, without forming a precise Notion of its Degrees. And secondly, by shewing, that though the Capacity of the Mind be not infinite, yet we can at once form a Notion of all possible Degrees of Quantity and Quality, in such a Manner at least, as, however imperfect, may serve all the Purposes of Reflection and Conversation.

Thus I have told the Reader what our Author has done. I cannot so compleatly shew him how he has done it; for at the most, I must set down only the Heads of those Arguments whereby he demonstrates the two foregoing Propositions. The first, asserting the Impossibility of conceiving any Quantity or Quality, without forming a precise Notion of its Degrees, he proves by these three: First, whatever Objects are distinguishable are separable by the Thought and Imagination, and *vice versa*. Secondly, it is confessed, that no Object can appear to the Senses, or, in other Words, that no Impression {362} can become present to the Mind, without being determined in its Degrees both of Quantity and Quality: to affirm otherwise, implies that it is possible for the same Thing to be and not to be. Thirdly, it is a Principle in Philosophy, that every thing in Nature is individual, and that it is utterly absurd to suppose a Triangle really existent, which has no precise Proportion of Sides and Angles. If this therefore be absurd in *Fact* and Reality, it must also be lo in *Idea*; since nothing of which we can form a clear and distinct Idea is absurd and impossible.[5] But to form an Idea simply, is the same Thing; *the Reference of the Idea to an Object being an extraneous Denomination, of which, in itself, it bears no Mark or Character*.

When our Author, by what he says upon these Heads, has convinced us of his first Proposition, he proceeds to confirm the second, relating to the Capacity of the Mind, for *forming at once a Notion of all possible Degrees of Quantity and Quality*. He tells us, when we have found a Resemblance among several Objects, we apply the same Name to all of them, whatever Differences may appear among them. When we have acquired a Custom of this kind, the hearing of that Name revives the Idea of one of these Objects, with all its particular Circumstances. But as the same Word has been frequently {363} applied to other Individuals, different in many Respects from that Idea which is immediately present to the Mind; the Mind not being able to revive the Idea of all the Individuals, only revives that Custom which we have acquired by surveying them.

> They are not really and in fact present to the Mind, but only in Power; nor do we draw them all out distinctly in the Imagination, but keep ourselves in a Readiness to survey any of them, as we may be prompted by a present Design or Necessity. The Word raises up an individual Idea, along with a certain Custom, and that Custom produces any other individual one for which we may have Occasion. But as the Production of all Ideas to which the Name may be applied, is in most Cases impossible, we abridge that Work by a more partial Consideration, and find but few Inconveniences to arise in Reasoning from that Abridgment.

When he has said this, and a good deal more, for the Explication of this Point, he tells us, the only Difficulty that can remain relating thereto is, to account for that Custom which so readily recalls every particular Idea for which we may have Occasion. The Method he takes for giving us a satisfactory Notion of it is, "by producing other Instances which are analogous to it, and other Principles which facilitate its Operation." His Observations for this Purpose are four, and it is evident he has a very good Opinion of them; for thus he says,

> Perhaps these four Reflections may help to remove all Difficulties to the Hypothesis I have proposed concerning abstract Ideas, so contrary to that which has hitherto prevailed in Philosophy. But, to tell the Truth, I place my chief Confidence in what I have proved concerning the Impossibility of general Ideas, according to the common Method of explaining them. We must {364} certainly seek some new System upon this Head, and there plainly is none beside what I have proposed.

Before he leaves this Subject, he deduces from the foregoing Principles an Explanation of that *Distinction of Reason*, (as he phrases it) which is so much talked of, and so little understood, in the Schools

We have gone thorough the first Part of this Book. In the second Part we find our Author's Notions of the infinite Divisibility, and other Qualities, of our ideas of Space and Time;[6] with divers Objections that may be made thereunto, and his Answers. He introduces this Chapter with an indirect Compliment upon himself; after which he repeats, in his own Way, a great many odd Fancies relating to this Topick, that have often made their Appearance in the Writings of other minute Philosophers. Of these I shall give the Reader a Taste, by the Recital of two or three in their Order. Thus he says,

It is certain that the Imagination[7] reaches a *Minimum*, and may raise up to itself an Idea, of which it cannot conceive any Sub-division, and which cannot be diminished without a total Annihilation. When you tell me of the thousandth and ten-thousandth Part of a Grain of Sand, I have a distinct Idea of these Numbers, {365} and of their different Proportions; but the Images which I form in my Mind to represent the Things themselves, are nothing different from each other, nor inferior to that Image by which I represent the Grain of Sand itself, which is supposed so vastly to exceed them. What consists of Parts is distinguishable into them, and what is distinguishable is separable.[8] But whatever we may imagine, the Idea of a Grain of Sand is not distinguishable, nor separable into 20, much less into 1000, 10000, or an infinite Number of different Ideas.

In a Paragraph or two after, our Author is certain again,

> That we can form Ideas which shall be no greater than the smallest Atom of the animal Spirits of an Insect a thousand times less than a Mite; and we ought rather to conclude, that the Difficulty lies in enlarging our Conceptions so much as to form a just Notion of

> a Mite.[9] For, in order to form a just Notion of these Animals, we must have a distinct Idea representing every Part of them; which, according to the System of infinite Divisibility, is utterly impossible; and, according to that of indivisible Parts or Atoms, is extremely {366} difficult, by reason of the vast Number and Multiplicity of these Parts.[10]

When our Author has ran through the Arguments he had picked up against the infinite Divisibility of Space, he tells us, it is true Mathematicians are wont to say, that there are equally strong Arguments on the other Side of the Question; and then he adds,

> Before I examine these Arguments and Objections in Detail, I will here take them in a Body, and endeavour, by a short and decisive Reason, to prove at once that it is utterly impossible they can have any just Foundation."

What an effectual Method has this Gentleman contrived of destroying his Antagonists! He first slays them all in a Body, and kills them one by one afterwards. I shall not say a Syllable of his particular Executions, but give the Reader a Sight only of that dreadful Instrument, whereby at a single Blow he takes away the Lives of all his Opposers.

> It is an established Maxim (says he) in Metaphysicks, *that whatever the Mind clearly conceives includes the Idea of possible Existence*; or, in other Words, that nothing we imagine is absolutely impossible. We can form no Idea of a Mountain without a Valley, and therefore regard it as impossible.

Now it is certain we have an idea of extension; for otherwise, shy do we talk or reason concerning it? It is likewise certain that this Idea, as conceived by the Imagination, though divisible into Parts, or inferior Ideas, is not infinitely divisible, nor consists of an infinite Number {367} of Parts: For that exceeds the Comprehension of our limited Capacities. Here then is an Idea of Extension, which consists of Parts, or inferior Ideas, that are perfectly indivisible; consequently this Idea implies no Contradiction; consequently it is impossible for Extension really to exist conformable to it; and consequently all the Arguments employed against the Possibility of mathematical Points are scholastick Quibbles, and unworthy of our Attention.

These Consequences we may carry one Step farther, and conclude that all the pretended Demonstrations for the infinite Divisibility of Extension are equally sophistical, since it is certain these Demonstrations cannot be just, without proving the Impossibility of mathematical Points; which it is an evident Absurdity to pretend to.

There is not, I am persuaded, any Reader hardy enough to withstand such Reasoning as this is. And I hope no one will be so ill-natur'd, as to refuse joining with the Author of it in a Compliment which he passes on himself, at the very Entrance of the third Section immediately following, wherein he considers the other Qualities of our Ideas of Time and Space.

> No Discovery (says he there) could have been made more happily for deciding all Controversies concerning Ideas, than that with which I at first set out, *viz. That Impressions always take the Precedency of them, and that every Idea with which the imagination is furnished, first makes its Appearance in a correspondent Impression*.

By the Application of this fortunate Principle, he proceeds to penetrate still farther into the Nature of our Ideas of Space and Time. What a vast Progress he has made in this Science, may be easily guess'd, by my here marking the very first Step he has therein taken:

> Upon {368} opening my Eyes, says he, and turning them to the surrounding Objects, I

perceive many visible Bodies; and upon shutting them again, and considering the Distance betwixt these Bodies, I acquire the Idea of Extension.

This is indeed a new Method of gaining it, entirely of our Author's Invention; but we shall see a little lower, that this reiterated Action of the Eye is not always necessary for that Purpose, but that the Idea of Extension may be had, at least without closing the Eye-lids. For thus he goes on, full as wisely as he begun.

As every Idea is derived from some Impression, which is exactly similar to it, the Impression similar to this Idea of Extension, must either be some Sensations derived from the Sight, or some internal Impressions arising from these Sensations. Our internal Impressions are our Passions; none of which, I believe, will ever be asserted to be the Model, from which the Idea of Space is derived. There remains therefore nothing but the Senses, which can convey to us this original Impression. Now what Impression do our Senses here convey to us? This is the principal Question, and decides without Appeal concerning the Nature of the Idea. And now follows his Answer, by the first Sentence of which we shall perceive, as I have said above, that this extraordinary Philosopher does not always need both to open and shut his Eyes, in order to acquire the simple Idea of Extension.

The Table before me, says he, is *alone sufficient by its View*, to give me an Idea of Extension. This Idea, then, is borrowed from, and represents some Impression, which this Moment appears to the Senses. But my Senses convey to me only the Impressions of coloured Points, disposed in a certain manner. If the Eye is sensible of any thing farther, I desire it may be pointed {369} out to me. But if it is impossible to shew any Thing further, we may conclude with Certainty, that the Idea of Extension is nothing but a Copy of these coloured points, and of the Manner of their Appearance.

So much for the *Extension* of Space. Not that our Author has here quitted it. He wades still farther therein, through several Pages, mixing Time alone with it, and viewing both in a Variety of Lights. Some of these are too dazzling for my weak Sight. I must therefore shun them; only telling the Reader, whose Eyes are strong enough for such Views, where he is to look for them. And besides the Sequel of the third Section, from the former Part of which we have had the three last Citations, there is the fourth Section, wherein divers of them are to be found, under the Title of Answers to the Objections, whereby Metaphysicians, Mathematicians, *&c*. have conspired to destroy our Author's Doctrine of indivisible Atoms.

When he begins to deal with the Geometricians, he says, at first Sight their Science seems favourable to his Thesis; and if it be contrary in its *Demonstrations*, 'tis perfectly conformable in its *Definitions*; his present Business then, as he adds, must be to defend the Definitions, and refute the Demonstrations.

I will have nothing to do in the Quarrel; if they cannot maintain their Demonstrations against his Attacks, they may even perish.

In the fifth Section, which is filled up likewise with Objections and Replies, he encounters the *Naturalists*, who hold the Reality of an absolute *Vacuum*. The Dispute upon this Head including divers subtle Speculations, interests the Metaphysicians also. The preceding Section was ushered in with a very brief Recapitulation of his System concerning Space and Time, which consists, as he tells us, of {370} two Parts. The first depends on this Chain of Reasoning. The Capacity of the Mind is not infinite; consequently no Idea of Extension or Duration, includes an infinite Number of Parts or inferior Ideas, but of a finite Number, and these simple and indivisible. The second is a

Consequence of the former, which implies, that the Parts into which the Ideas of Space and Time resolve themselves, become at last indivisible; and these indivisible Parts, being nothing in themselves, are inconceivable, when not filled with something real and existent. The Ideas of Space and Time are therefore no separate or distinct Ideas, but merely those of the Manner or Order, in which Objects exist; Or, in other Words, 'tis impossible to conceive either a Vacuum and Extension without Matter, or a Time, when there was no Succession or Change in any real Existence.

The first half of this System he has incontestably proved in the foregoing Pages of this Work; and I have given my Readers a slight Taste of his Demonstrations; the second Part of it is the Basis of the fifth Section, wherein he delivers his Sentiments of a *Vacuum*; for therefrom, he says, it follows, "that we can form no Idea of a *Vacuum*, or Space, where there is nothing visible or tangible." This gives Rise (and will it may) to three Objections; which he most intelligibly tells us, *he shall examine together, because the Answer he shall give to one is a Consequence of that which he shall make use of for the others*.

One might from these Answers collect many Passages, which would give us a high Conceit of the Author's Sagacity. Let us pick out only two or three for a Sample. Thus, he has discover'd that

> **a Man, who enjoys his Sight, receives no other Perception from turning his Eyes on every Side, when entirely deprived of Light, than what is {371} common to him with one born blind; and 'tis certain, he adds, such a one has no Idea either of Light or Darkness.**

A Page or tow after, where he is shewing, that Motion does not presuppose a *Vacuum*, he says, admirably to that Purpose,

> **suppose a Man to be supported in the Air, and to be softly conveyed along by some invisible Power; 'tis evident he is sensible of nothing, and never receives the Idea of Extension, nor indeed any Idea, from this invariable Motion. Even suppose, he moves his Limbs too and fro, this cannot convey to him that Idea. He feels in that Case a certain Sensation or Impression, the Parts of which are successive to each other, and may give him the Idea of Time, but certainly are not disposed in such a Manner, as is necessary to convey the Idea of Space or Extension.**

Again, his Argument leading him to inquire, whether the Sight can convey the Impression and Idea of a *Vacuum*? To determine that it cannot, among other Considerations he puts a Case of two luminous Bodies appearing at some Distance from one another, upon a Field (if I may so express it) of absolute Darkness. Now as the Distance between these Objects is not any thing coloured or visible, it may be thought, he says, that there is here a *Vacuum* or pure Extension, not only intelligible to the Mind, but obvious to the very Senses. This, he owns, is our natural and most familiar Way of thinking; but he evinces it to be a wrong one: For

> **since this Distance causes no Perception different from what a blind Man *receives from his Eyes*, or what is convey'd to us in the darkest Night, it must partake of the same Properties; and as Blindness and Darkness afford us no Ideas of Extension, it is impossible, that the dark and undistinguishable Distance {372} between two Bodies can ever produce that Idea. Again,**

His Subject leading him to observe, as a general Maxim in the Science of human Nature, that *where-ever there is a close Relation betwixt two Ideas, the Mind is very apt in all its* Discourses *and Reasonings to use the one for the other*; he undertakes to assign the Causes of this Phoenomenon (as he calls it.) Accordingly he remarks,

> that as the Mind is endowed with a Power of exciting any Idea it pleases; whenever it dispatches the Spirits into that Region of the Brain, in which the Idea is placed, these Spirits always excite the Idea, when they run precisely into the proper *Traces, and rummage* that Cell which belongs to the Idea. But as this Motion is seldom direct, and *Naturally turns a little to the one Side or the other*; for this Reason the animal Spirits, falling into contiguous Traces, present the related Ideas in lieu of that, which the Mind desired at first to survey. This Change we are not always sensible of; but continuing still the same Train of Thought, make use of the related Idea, which is presented to us, and employed in our Reasoning, as if it were the same with what we demanded.

What could *Cartesius* or *Malebranch* have said more *a propos* upon this Head! How admirably does this account for the Mistakes and Sophisms so frequent and so fatal in Philosophy.

I said at the Head of these Citations, that I should extract them from our Author's Reply to certain Objections, and I verily thought I had done so, when reading farther, I was a little staggered, at the Top of a Paragraph, with the Sentence,

> After this Chain of Reasoning and Explication of my Principles, I am now prepared to answer all the Objections that have been offered, whether {373} deriv'd from *Metaphysicks* or *Mechanicks*.

I was just resolving to look back, to see how I came to be so mistaken, when I made myself easy, by reflecting on the Genius of my Author, who often affects to startle or perplex his Readers: And indeed as I went forward, I found nothing to alter my Opinion of what was past, or to answer the Expectation that might naturally be rais'd by the above Declaration.

If what I have been mentioning in some Measure puzzled me, I was no less charmed at an Instance of our Author's superlative Modesty, which appears a Page or two after. For there, when he is returning as it were from the utter Overthrow of his Opposers, his Stile is so unlike that of a Conqueror, that it would rather induce one to think he had been defeated.

> Thus, says he, I *seem* to have answer'd the three Objections above-mentioned; tho' at the same time I am sensible, that few will be satisfied with these Answers, but will immediately propose new Objections and Difficulties.

One of these he guesses at, and tells us,

> 'Twill probably be said, that his Reasoning makes nothing to the Matter in hand, and that he explains only the Manner in which Objects affect the Senses, without endeavouring to account for their real Nature and Operations.

To this Objection, he very candidly says, he answers,

> by pleading guilty, and by confessing that his Intention never was to penetrate into the Nature of Bodies, or explain the secret Causes of their Operations. -- As to those who attempt to do so, he cannot approve of their Ambition, till he sees, in some one Instance at least, that they have met with Success. He contents himself with knowing perfectly the Manner in which Objects affect his Senses, and their Connexions with each other, as far as Experience informs {374} him of them. This suffices for the Conduct of Life; and this suffices also for his Philosophy, which *pretends only to explain the Nature an Causes of our Perceptions, or Impressions and Ideas*.

I cannot say what will suffice for his Philosophy, but I will venture to affirm his Philosophy will never suffice to acquaint us with either the Nature or Causes of our Perceptions; any farther than

any Man's Consciousness will do, without it.

In the next Paragraph he assumes the Air of a Sphinx, only not attended with the horrible Cruelty of that Monster. He advances a Paradox at least as obscure as the other's *Enigma*; notwithstanding he is pleased to assert it will easily be explain'd from the foregoing Reasoning. The ensuing is an exact transcript of it.

> I shall (says he) conclude this Subject of Extension, with a Paradox. -- This Paradox is, that if you are pleased to give to invisible and intangible Distance, or in other Words, to the Capacity of becoming a visible and tangible Distance, the Name of a *Vacuum*, Extension and Matter are the same, and yet there is a *Vacuum*. If you will not give it that Name, Motion is possible in a *Plenum*, without any Impulse *in infinitum* without returning in a Circle, and without Penetration."

This dark Saying brings us very near to the End of a fifth Section, which closes with proving *Time to be nothing but the Manner in which some real Object exists*.

The sixth (which is the last) Section of the second Part of this Work, treats *of the Ideas of Existence, and of external Existence*. As our Author handles these abstruse Points more fully hereafter, I shall take no notice of what he has said here, where he has only hinted his Sentiments concerning them. {375}

I proceed now therefore to the third Part of this Treatise, where the Author has descanted very largely on two very curious Topicks, *Knowledge* and *Probability*. Were I to make a methodical Abstract of the several Sections into which his Discourse on these Heads is divided, it would carry me far beyond the Space I ought to allow this Article; I must therefore follow the Course I have hitherto gone in, contenting myself with only selecting here and there an extraordinary Passage, for the Readers Information and Entertainment.

The first Section of this Part opens with an Enumeration of the different Kinds of philosophical Relation. They are seven, viz. *Resemblance, Identity, Relations of Time and Place, Proportion in Quantity or Number, Degrees in any Quality, Contrariety*, and *Causation*. Our Author afterwards tells us, that only four of these can be the Objects of Knowledge and Certainty. These four are *Resemblance, Contrariety, Degrees in Quality, and Proportions in Quantity or Number*. The three first, he says, are discoverable at first Sight, and fall more properly under the Province of Intuition than Demonstration: Which last is chiefly concerned in fixing the *Proportions of Quantity or Number*. Here he takes Occasion of passing a Verdict on Geometry, very different from that of the more unthinking Bulk of Mankind, who are apt to entertain I know not what Prejudices in its Favour.

> It is, he tells us, the *Art*, by which we fix the Proportions of Figures; but which, tho' it much excels, both in Universality and Exactness, the loose Judgments of the Senses and Imagination, yet never attains a perfect Precision and Exactness. Its first Principles are still drawn from the general Appearance of the Objects; and that Appearance can never afford us any Security, when we examine the prodigious Minuteness of {376} which Nature is susceptible. Our Ideas seem to give a perfect Assurance, that no two right Lines can have a common Segment; but if we consider these Ideas, we shall find, that they always suppose a sensible Inclination of the two Lines, and that where the Angle they form is extremely small, we have no Standard of a right Line so precise as to assure us of the Truth of this Proposition."

The Geometricians, who would consult their own Edification, may, in the Original, whence I have

extracted this Passage, meet with others on the same Head, which discover the Depth of this great Mathematician's Erudition. One thing pleases me vastly, which is the Impartiality where-with he checks the Boastings of some of his scientific Brethren.

> 'Tis usual, says he, with Mathematicians, to pretend that those Ideas, which are their Objects, are of so refin'd and spiritual a Nature, that they fall not under the Conception of the Fancy, but must be comprehended by a pure and intellectual View, of which the superior Faculties of the Soul are alone capable."

This, he affirms, is all an Artifice; and to destroy it we need only, as he says, reflect on that Principle (of his) so oft insisted on, *that all our Ideas are copied from our Impressions*. I have afore hinted the mighty Value of this Discovery, the Honour of which is intirely due to our Author, but it cannot be too often inculcated. I verily think, if it were closely pursued, it would lead us to several inestimable *Desiderata*, such as the *perpetual Motion*, the *grand Elixir*, a *Dissolvent of the Stone, &c*. Many Wonders have been done in the Republick of Letters by a single and very simple Principle; tho' I question if any may compare with the above-mentioned, except that of *M. Leibnitz*. Every one has heard, what an immense Field of Knowledge he opened by his *Sufficient Reason*, and how much {377} wiser the World is by it, at this Day. Such Benefactors to Mankind will always be the Admiration of Posterity.

I proceed to say a Word or two of the second and third Sections. In the former we have somewhat about *Probability*, and *the Idea of Cause and Effect*. In the latter we are told, *Why a Cause is always necessary*. All manner of Persons, that have any Antipathy to the Argument *a Priori* for the Existence of God, may repair to this latter Section, where they will have the Satisfaction of seeing it utterly demolished. This Writer has here destroy'd the Foundation of it, and so there's an End of the whole Fabrick. Dr. *Clarke*, and one *John Lock*, Esq; whom he particularly names, two of the most superficial Reasoners, were, as well as many others, so weak as to fancy, that *whatever begins to exist, must have a Cause of Existence*; nay, *Hobbes* himself, as much an Atheist as we believe him, was of this Opinion: Every one knows, how he, and the greater Men afore named, pretended to evince the Proposition; but our Author pronounces all they produced for that Purpose fallacious, sophistical, and frivolous; and he really thinks it unnecessary to employ many Words in shewing the Weakness of their Arguments.

But, tho' our Author has quite erased the Argument *a Priori* for the Divine Existence, I would willingly hope, he has no Intention of weakening this fundamental Truth, that *there is some one necessary, eternal, independent Being*; nor does he directly assert a *Thing may come into Being without a Cause*; only he will have *Experience* to be the sole Road by which we can arrive at the Certainty of this *Thesis, Whatever has began to exist, must have had a Cause of its Existence*. And that *Experience* will lead us thereunto, is what, I fancy, our Author aims at proving, in some ensuing Sections. I would be {378} more positive upon this Point if I could; but having run over the Sections referr'd to (13 in Number) in order to know whether this were the real Scope of them, I acknowledge I cannot understand them enough to pronounce dogmatically: Nor is it to be wonder'd at, if I am at a Loss in this Matter, seeing any Man must be so, who is not bless'd with an extraordinary Penetration; according to our Author's own Acknowledgement of the relative Obscurity of this Part of his Argument. For about the Middle of the twelfth Section he very well says,

> I am sensible how abstruse all this Reasoning must appear to the generality of Readers, who not being accustomed to such *profound Reflections* on the *intellectual* Faculties of

> the Mind, will be apt to reject as chimerical whatever strikes not in with the common received Notions, and with the easiest and most obvious Principles of Philosophy. And no doubt there are some Pains required to enter into these Arguments; tho' perhaps very little are necessary to perceive the *Imperfection of every vulgar Hypothesis* on this Subject, and the little Light, which Philosophy can yet afford us in such sublime and such curious Speculations.

And again, in the XIVth Section, after some farther refined Speculations,

> he thinks it proper to give Warning, that he has just now examined one of the most sublime Questions in Philosophy, *viz. that concerning the Power and Efficacy of Causes*; where all the Sciences seem so much interested.

And the Reason of this Warning partakes of the Excellency of its Subject: For he adds,

> Such a Warning will naturally rouze up the Attention of the Reader, and make him desire a more full Account of his Doctrine, as well as of the Arguments on which it is founded.

A noble issue indeed, and most graciously encouraged, for thus he treats it:

> This Request, says {379} he, is so reasonable, that I cannot refuse complying with it; especially as I am hopeful, that the Principles I proceed on, the more they are examined, will acquire the more Force and Evidence.

Undoubtedly.

That I was right in my Conjecture, as to the real Purport of the afore-named Sections, appears with great Probability from the ensuing Passages, which occur toward the latter End of them; and which I do not vainly quote as Testimonies of my Sagacity in guessing, but to instruct the Reader in a Question of the highest Dignity in Metaphysicks; that is, in our Author's own Stile, *Why a Cause is always necessary?* or, in vulgar Phrase, Why the Mind conceives a Cause necessary to the Existence of every thing that has a Beginning? He says,

The Idea of Necessity arises from some impression. There is no Impression conveyed by our Senses which can give Rise to that Idea. It must therefore be derived from some internal Impression, or Impression of Reflection. There is no internal Impression which has any Relation to the present Business, but *that Propensity which Custom produces to pass from an Object to the Idea of its usual Attendant*. This therefore is the Essence of Necessity. Upon the whole, Necessity is something that *exists in the Mind, not in Objects*; nor is it possible for us ever to form the most distant Idea of it, considered as a Quality of Bodies. Either we have no Idea of Necessity, or Necessity is nothing but *that Determination of the Thought to pass from Causes to Effects, and from Effects to Causes, according to their experienced Union*.

Thus as the Necessity which makes two times two equal to four, or three Angles of a Triangle equal to two right ones, lies only in the Act of the Understanding, by which we consider and {380} compare these Ideas; in like manner the Necessity of Power, which unites Causes and Effects, lies in the Determination of the Mind to pass from the one to the other. The Efficacy or Energy of Causes is neither placed in the Causes themselves, nor in the Deity, nor in the Concurrence of these two Principles; but belongs entirely to the Soul, which considers the Union of two or more Objects in all past Instances. It is here that the real Power of Causes is placed along with their Connexion and Necessity. A most wonderful Doctrine, I protest, and such our Author acknowledges it to be; for he immediately subjoins,

I am sensible, that of all the Paradoxes which I have had, or shall have Occasion to advance in the Course of this Treatise, the present one is the most violent, and that it is merely by Dint of solid Proof and Reasoning I can ever hope it will have admission, and overcome the inveterate Prejudices of Mankind. -- There is commonly an Astonishment attending every thing extraordinary; and this Astonishment changes immediately into the highest Degree of Esteem or Contempt, according as we approve or disapprove of the Subject. I am much afraid that though the foregoing Reason appears to me the shortest and most decisive imaginable; yet with the generality of Readers the Bias of the Mind will prevail, and give them a Prejudice against the present Doctrine. -- The contrary Notion is so riveted in the Mind from the Principles above-mentioned, that I doubt not but my Sentiments will be treated by many as extravagant and ridiculous. Likely enough, truly; for any one who reads these Passages must be convinced, that some Men are very strange and uncouth Animals. Our admirable Author must expect to be nibbled at, as all great Genius's have been, by {381} a Parcel of stupid Impertinents, for whom he has generously framed a compleat Set of Objections: What!

> **the Efficacy of Causes lie in the Determination of the Mind! As if Causes did not operate entirely independent of the Mind, and would not continue their Operation, even though there was no Mind existent to contemplate them, or reason concerning them. Thought may well depend on Causes for its Operation, but not Causes on Thought. This is to reverse the Order of Nature. To every Operation there is a Power proportioned; and this Power must be placed on the Body that operates. If we remove the Power from one Cause, we must ascribe it to another: But to remove it from all Causes, and bestow it on a Being that is no ways related to the Cause or Effect by perceiving them, is contrary to the most certain Principles of human Reason.**

Let these Simpletons talk thus if they please, our Author despises their Attacks as he ought: He only replies to all these Arguments (as he vouchsafes to call them)

> **That the Case is here much the same, as if a blind Man should pretend to find a great many Absurdities in the Supposition, that the Colour of Scarlet is not the same with the Sound of a Trumpet, nor Light the same with Solidity.**

A Page or two after this notable Sentence, he begins to think it is Time to collect all the different Parts of his Reasoning, (in which he acknowledges he has, though on justifiable Motives, advanced in a seemingly preposterous Manner) and by joining them together, form an exact Distinction of the Relation of *Cause* and *Effect*, which makes the Subject of the present Inquiry. There may, he tells us, two Definitions be given of this Relation, which are different, only by their presenting a different View of the same Object, and making us consider {382} it either as a *philosophical* or as a *natural* Relation. We may define a CAUSE to be

> **An Object precedent and contiguous to another, and where all the Objects resembling the former are placed in like Relations of Precedency and Contiguity to those Objects that resemble the latter.**

This Definition lies far out of the Reach of my Capacity, and I am indeed in some Doubt whether it be intelligible to any but Men of our Author's Ability. His second Definition is a little more comprehensible, and is designed for the Satisfaction of such as may esteem the former defective, because drawn from Objects, as he says, foreign to the C???.[11] It is this,

> **A CAUSE is an Object precedent and contiguous to another, and so united with it, that the idea of the one determines the Mind to form the Idea of the other, and the**

> Impression of the one to form a more lively Idea of the other.

Should this Definition be rejected for the same Reason as the foregoing, he knows no other Remedy, than that the Persons who express this Delicacy, should substitute a juster Definition in its Place. But for his Part, he honestly owns his Incapacity for such an Undertaking. For

> when he examines with the utmost Accuracy those Objects, which are commonly denominated Causes and Effects, he finds, in considering a single Instance, that the one Object is precedent and contiguous to the other; and in enlarging his View to consider several Instances, he finds *only*, that like Objects are constantly placed in like Relations of Succession and Contiguity. Again, when he considers the Influence of this constant Conjunction, he perceives, that such a Relation can never be an Object of Reasoning, and can never operate upon the Mind but by means of Custom, which determines the Imagination to make a Transition from the Idea of one Object to that {383} of its usual Attendant, and from the Impression of one to a more lively Idea of the other.

However extraordinary these Sentiments may appear, [I use this incomparable Arguer's own Words] he thinks it fruitless to trouble himself with any further Inquiry or Reasoning upon the Subject, but shall repose himself on them as on established Maxims. *Amen*.

But though he has thus taken Leave of his Subject, with respect to Inquiring and Reasoning, he does not part with it for-good-and all, till he has drawn some Corollaries from it; by which he very kindly undertakes to remove several Prejudices and popular Errors that have very much prevailed in Philosophy. They that will see these Curiosities must go to the Original; for I cannot in this Abstract insert Examples of every thing therein remarkable.

I proceed to the fifteenth Section of the first Book, where eight Rules are laid down, by which to judge of Causes and Effects. The Reader may look at them if he pleases, when he goes to view the above-mentioned Corollaries. All I shall take notice of here, is a Passage ushering them in, and another that follows them: And really they are both admirable in their several Ways. In the first, our Author says, that according to the Doctrine he has been establishing,

> any thing may produce any thing. Creation, Annihilation, Motion, Reason, Volition; all these may arise from one another, or from any other Object we can imagine.

A most charming System indeed! one can hardly conceive the Uses it may be put to, and the different Purposes it will serve: It is to be hoped, the inimitable Inventor will one Day give us a large and ample Account of them.

I cannot help violating a rash Engagement. I said I would take no notice of the Rules above {384} spoken of. But, casting my Eye on the last of them, it was impossible not to admire the beautiful Example therein exhibited of the Justness of our Author's Principles. This Rule is,

> That an Object which exists for any Time in its full Perfection *without any Effect,* is not the sole Cause of *that Effect,* but requires to be assisted by some other Principle which may forward its Influence and Operation.

Now here the Reader, as I say, may see an Exemplification of our Author's Doctrine, "That *any thing* may produce *any thing*." Among which any Things he reckons *Annihilation* and *Creation*; or, in other Terms, he asserts, *something* may arise from, or be produced by, *nothing*. And so it is in the above Rule, where we find *without any Effect,* i.e. *nothing,* turned, in the Twinkling of an Eye, into *that Effect,* which is *something*.

When he has led us thorough this fine Train of Argument concerning *Cause* and *Effect*, he tells us,

> Here is all the *Logic* he thinks proper to employ in his Reasoning; and perhaps even this was not very necessary, but might have been supplied by the natural Principles of our Understanding. Our scholastick Head-pieces and Logicians shew no such Superiority above the mere Vulgar in their Reason and Ability, as to give us any Inclination to imitate them in delivering a long System of Rules and Precepts to direct our Judgment in Philosophy.

In the sixteenth Section, which finishes the third Part of the first Book, we meet with certain Reflections on the *Reasons* of *Animals*. These are calculated for confirming the foregoing Doctrine about Cause and Effect, how remote soever they may seem from such a Purpose; and yet so effectually they answer it, as almost intuitively, he tells us, to evince the Truth of his System. {385}

We come now to the fourth Part of this Volume, of which we shall not offer to make any exact Analysis, only select a few curious Passages, such as we think most conducive to the Reader's Pleasure and Edification. In this Part our Author treats of the sceptical and other Systems of Philosophy; and he sets out like himself, advancing and descanting upon Propositions that never enter into the Heads of ordinary Writers. Thus in the very first Paragraph he shews there is no such Thing as Science, strictly speaking, but that all Knowledge degenerates into Probability;

> and this Probability is greater or less, according to our Experience of the Veracity or Deceitfulness of our Understanding, and according to the Simplicity or Intricacy of the Question.

And his second paragraph assures us,

> there is no Algebraist nor Mathematician that places entire Confidence in any Truth immediately upon his Discovery of it, or regards it as any thing but a mere Probability. Every Time he runs over he Proofs, his Confidence increases; but still more by the Approbation of his Friends; and is raised to its utmost Perfection by the universal Assent and Applauses of the learned World.

After this he proceeds thorough five Pages in the Language of a *Sceptic*; and then he informs us of the Design he had in view by so doing, which was to render us sensible of the Truth of his Hypothesis, *viz. That all our Reasonings concerning Causes and Effects are derived from nothing but Custom*; *and that Belief is more properly and Act of the sensitive, than part of the* cogitative *Part of our Natures*. That Sequel of this Section is employed in guarding what he has advanced upon this Head, from some Objections to which it might unwarily be thought liable.

In the second Section he considers Scepticism with regard to the Senses. And here he inquires {386} into the Causes which induce us to believe in the Existence of Body: And his Reasonings on this Point he begins with a Distinction which will contribute, he assures us, very much to the perfect understanding of what follows. We ought, as he says, to examine apart those two Questions, which are commonly confounded together, *viz. Why we attribute a* CONTINUED *Existence to Objects, even when they are not present to the Senses*? and *why we suppose them to have an Existence* DISTINCT *from the Mind and Perception*. Upon a very careful Scrutiny, he rejects what has commonly been offered for the Solution of these *Queries*, and proposes one of his own; which, as he apprehends, very clearly and satisfactorily accounts for what is contained in them.

Glad would I be, could I present my Readers with the Sentiments of so profound and accurate a Genius as we are now dealing with, upon one of the most abstruse and perplexing Topicks in all Metaphysicks; but alas! they are of too wide an Extent for the Compass of this Article: However,

we will endeavour to introduce some Specimens thereof, whereby we shall at least see how happy a Talent he has for surmounting those Difficulties, which have proved the *ne plus ultra* of many others.

After a little Examination we shall, he says, find, that all those Objects to which we attribute a continued Existence, have a peculiar *Constancy* which distinguishes them from the Impressions, whose Existence depends upon our Perception. Those Mountains, and Houses, and Trees, which lie at present under my Eye, have always appeared to me in the same Order; it is so also with my Bed and Table, my Books and Papers; and when I lose Sight of them by shutting my Eyes, or moving my Head, I soon after find {387} them recur upon me without the least Alteration. This is the Case with all the Impressions, whose Objects are supposed to have an external Existence; and is the Case with no other Impression, whether gentle or violent, voluntary or involuntary.

This Constancy, however, is not so perfect as not to admit of very considerable Exception. Bodies often change their Position and Qualities, and after a little Absence or Interruption may become hardly knowable. But in these Changes they preserve a *Coherence*, and have a regular Dependence on each other, which produces, very reasonably, the Opinion of their continued Existence.-- This *Coherence* therefore in their Changes, is one of the Characteristics of external Objects, as well as their Constancy.

When our Author has shewn that the Opinion of the continued Existence of Body depends on the COHERENCE and CONSTANCY of certain Impressions, he proceeds to examine after what Manner these Qualities give rise to so extraordinary a Judgment. He begins with the *Coherence*, which he considers very minutely, in order to discover its whole Efficacy this way; the Consequence of which is,

> that he is afraid, whatever Force we may ascribe to this Principle, 'tis too weak to support alone so vast an Edifice, as is that of the continued Existence of all external Bodies; and that we must join the *Constancy* of their Appearance to the *Coherence*, to give a satisfactory Account of that Opinion.

How pertinent is this Conclusion, when our Author has afore expresly grounded the Opinion here spoken of, on the *Constancy* of Appearance, and brought in the *Coherence* only as a Sort of *Succedaneum!* Besides that, his Business here, as may be supposed from the fourth Line of this Paragraph, is not to say what the Effect of these Properties {388} is, but to instruct us in the *Modus* of their Operation. However, we must follow him in his own Way. Accordingly,

Having taken a strict Survey of the Power of *Coherence*, and seen what it will, and what it will not do in the Case before us, he takes *Constancy* to task in much the same manner. But,

> as the Explication of this, he says, will lead him into a considerable Compass of *very profound Reasoning*, he thinks it proper, to avoid Confusion, to give a short Sketch or Abridgment of his System, and afterwards draw out all its Parts in their full Compass.

As for his System in *Miniature*, there are four Things, he tells us, requisite to justify it. I shall take notice only of the first, which is, to explain the *Principium individuationis,* or Principle of Identity. Concerning this most curious Point, he observes,

> That the View of any one Object is not sufficient to convey the Idea of Identity. For in that Proposition, an *Object is the same with itself,* if the Idea express'd by the Word, *Object*, were no ways distinguished from that meant by *itself*; we really should mean nothing, nor would the Proposition contain a Predicate and a Subject, which however

> are implied in this Affirmation. One single Object conveys the Idea of Unity, not that of Identity. On the other hand, a Multiplicity of Objects can never convey this Idea, however resembling they may be supposed. The Mind always pronounces the one not to be the other. -- Since then both Number and Unity are incompatible with the Relation of Identity, it must lie in something that is neither of them. But to tell the Truth, at first Sight this seems utterly impossible. Betwixt Unity and Number there can be no Medium; no more than between Existence and Non-existence. -- {389}

Very true. But now let us see how dexterously our most ingenious Author gets rid of this seemingly inextricable Difficulty. For this Purpose he needs only have recourse to the Idea of Time or Duration. He has already remark'd,[12]

> That Time, in a strict Sense, implies Succession, and that when we apply its Idea to any unchangeable Object, 'tis only by a Fiction of the Imagination, by which the unchangeable Object is supposed to participate of the Changes of the coexistent Objects, and in particular of that of our Perceptions. This Fiction of the Imagination almost universally takes place; and 'tis by means of it, that a single Object, placed before us, and survey'd for any Time without our discovering in it any Interruption or Variation, is able to give us a Notion of Identity. For when we consider any two Points of this Time, we may place them in different Lights: We may either survey them at the very same instant; in which Case they give us the Idea of Number, both by themselves and by the Object; which must be multiplied, in order to be conceived at once, as existent in these two different Points of Time: Or on the other hand, we may trace a Succession of Time by a like Succession of Ideas, and conceiving first one Moment, along with the Object then existent, imagine afterwards a Change in the Time without any *Variation* or *Interruption* in the Object; in which Case it gives us the Idea of Unity.

Here then, our Author says, is an Idea, which is a Medium betwixt Unity and Number; or more properly speaking, is either of them, according to the View in which we take it: And this Idea we {390} call that of Identity.

> Thus, as he adds a little after, the Principle of Individuation is nothing but the *Invariableness* and *Uninterruptedness* of any Object, through a supposed Variation of Time, by which the Mind can trace it in the different Periods of its Existence, without any Break of the View, and without being obliged to form the Idea of Multiplicity or Number.

Those Readers, who know all the Mr. *Lock* and his Corrector Dr. *Butler* have wrote upon this puzzling Subject, without being fully satisfied therewith, will certainly be pleas'd to find all their Difficulties vanish upon the Perusal of these few Paragraphs relating to it.

Where our Author's little System ends, and his great and extensive one begins, I have not been able, notwithstanding I have search'd very diligently, to perceive; I am apt to think they insensibly run into, and incorporate with one another. Perhaps the larger System is no other but the Explication of those four Things which he proposed to consider, as requisite for the Justification of the lesser. I must leave that Point undetermined. {391}

[To be continued.]

A Continuation of the Twenty-sixth Article.

THERE are many curious Particulars in the Section I am now upon, besides those I have

mentioned; but without stretching my Account of this Work into a Volume, there is no insisting upon them as they deserve; I shall therefore drop them all, excepting one little Passage, which merits a peculiar Attention, and that is his Definition of the human Mind:

> **What we call a Mind, says our Author, is nothing but a Heap or Collection of different Perceptions united together by certain Relations, and supposed, though falsely, to be endowed with a perfect Simplicity and Identity.**

In the third Section we meet with some very profound Reflections on the *ancient Philosophy*. Our Author is persuaded there might be several useful Discoveries made from a Criticism of the {392} Fictions of it, concerning *Substances* and *substantial Forms*, *Accidents* and *occult Qualities*; which, however unreasonable and capricious, have, he says,a very intimate Connexion with the Principles of human Nature. In the Sequel of this Section he has obliged us with an inductive Proof of this Position.

That which follows contains a Set of Observations on the *modern Philosophy*. This, he tells us, pretends to subsist on a Basis very different from that of the foregoing, and to arise only from such as are the solid, permanent, and consistent Principles of the Imagination. He goes on in discussing the Equity of this Pretension. He remarks, that the fundamental Principle of this Philosophy is the Opinion of the secondary Qualities of Bodies being merely Sensations in us, like to which there is nothing in the Bodies themselves; but this Supposition, as he labours to prove,

> **instead of explaining the Operations of external Objects, utterly annihilates all those Objects, and reduces ourselves to the Opinions of the most extravagant Scepticism concerning them.**

With this Section our Author concludes his Speculations on the Materials, the Modifications, and the Instruments of our Knowledge. He has traced the Origin of our Ideas, and has ranged them in their several and proper Classes; he has then combined, separated, and done I know not what with them; and lastly, he has given us a faithful Representation of the ancient and modern Systems, invented for the Acquisition of Science. His Scheme now carries him much further, into vastly sublimer Regions of Metaphysicks; the Immateriality of the Soul, and its Affections, are hereafter the nobler Subjects of his Researches; I shall endeavour, notwithstanding, to keep him still in view, and every {393} now and then to let my Readers have a Glimpse of him.

I have remarked,[13] that this Writer deals mightily in *Egotisms*; he is no less notable for Paradoxes. Some few of these I have cited, and we shall meet with many others in what follows; even in the very next, that is, the fifth Section, which I am now entering upon, there are at least half a Dozen, enough to stagger any Man who has not a strong Head-piece. The Title of this Section is, *Of the Immateriality of the Soul*. And the Intention of it is to shew, that the Immateriality of the Soul is a nonsensical Expression, and the Belief of it a most horrible Heresy. The Author begins with telling us, that the intellectual World, though involved in infinite Obscurities, is not however perplexed with any such Contradictions as in the foregoing Pages he has proved to attend every System concerning external Objects, and the Idea of Matter, which we fancy so clear and determinate. There are indeed certain Philosophers, as he complains, who, envious of this good Quality in the Subject, would fain load it with those Absurdities from which it is naturally free. These troublesome Gentlemen are the curious Reasoners concerning the material or immaterial Substances, in which they suppose our Perceptions to inhere. But, to put an effectual Stop to their Impertinence, he has set them a Question, which he very well knows is sufficient entirely to employ them till Doom's-day, and that is, in a few Words, *What they mean by Substance and Inhesion?*

Some of the Difficulties which will obstruct the Response of this *Query*, he has very fairly set down, and he as fairly warns his Antagonists that he will keep them strictly to the Point, and that it will be in vain for them to think of {394} shuffling; for if they should attempt to evade the foresaid Difficulties, by saying, that the Definition of a Substance is *something which may exist by itself*, and that this Definition ought to satisfy us, he presently whips about, to their Confusion, and observes,

> That this Definition agrees to every thing that can possibly be conceived; and never will serve to distinguish Substance from Accident, or the Soul from its Perceptions.

For thus he reasons.

> Whatever is clearly conceived may exist; and whatever is clearly conceived after any manner, may exist after the same manner.

This is one Principle. which has already been acknowledged.

> Again, every thing which is different, is distinguishable, and every thing which is distinguishable, is separable by the Imagination.

This is another Principle. The Conclusion from both is,

> that since all our Perceptions are different from each other, and from every thing else in the Universe, they are also distinct and separable, and may be considered as separately existent, and may exist separately, and have no need of any thing else to support their Existence. They are therefore Substances, as far as this Definition explains a Substance.

When by these, and some other wise Sayings, he has evinced that we can never arrive at any satisfactory Notion of Substance, and that we ought therefore utterly to abandon all Dispute concerning the Materiality or Immateriality of the Soul, he proceeds however, oddly enough, to engage himself in the Controversy, by attacking an Argument for the Soul's Immateriality, commonly employed, but which yet seems to him, he says, remarkable. This Argument he has spread over a whole Page. The Sum of it is, *That Thought, or Consciousness, cannot be the Property of a divisible Subject*. The whole of what he replies to this, is too long to be {395} here transcribed; but I can assure the Reader, that he has seldom, if ever, met with any thing more extraordinary. What he has delivered in the first and second Paragraphs of his Answer, is of so unusual a Nature, that it will, it seems, prevent our being surprised, if he, in consequence of it, lays down a Maxim, which he owns is condemned by several Metaphysicians, and is esteemed contrary to the most certain Principles of human Reason. This Maxim is, *that an Object may exist, and yet be no where*: And he asserts, that this is not only possible, but that the greatest Part of Beings do and must exist after this manner. See how he proves and illustrates this Proposition.

> An Object can be said to be no where, when its Parts are not so situated with respect to each other, as to form any Figure or Quantity; nor the whole, with respect to other Bodies, so as to answer to our Notions of Contiguity or Distance. Now this is evidently the Case with all our Perceptions and Objects, except those of the Sight and Feeling. A moral Reflection cannot be placed on the Right or on the Left-Hand of a Passion; nor can a Smell or Sound be either of a circular or square Figure. These Objects and Perceptions, so far from requiring any particular Place, are absolutely incompatible with it.

-- What a prodigious Stretch of Invention is here? How vastly do these Speculations exceed in Fineness the finest of the *Aristotelian* Cobwebs? They are coarse as Sackcloth in comparison with

them. And then as to the Absurdity of imagining real Objects to be no where, our Author says,

> **if they *appear* not to have any particular Place, they may possibly exist in the same manner; since whatever we conceive is possible. {396}**

It will not after this, he says, be necessary to prove that those Perceptions which are simple, and exist no where, are incapable of any Conjunction in Place with Matter or Body which is extended and divisible; since it is impossible to found a Relation but on some common Quality. But it is certain, according to him, that all the Difficulties they labour under who ascribe Thought to an extended divisible Subject, all the Absurdities they lay themselves open to the Imputation of, are owing merely to their Ignorance and Neglect of this Doctrine: Did they but understand it, they might, by a dexterous Use thereof, effectually silence all the Cavils of their Adversaries. Indeed, while they go upon other Principles, bestowing a Place on what is absolutely incapable of it, and conjoining Thought with extension locally, our Author himself says, we cannot refuse to condemn them; but let them espouse his *Tenet*, and he will insure them a Triumph. He instructs them not only how they may baffle, but retort their Enemies Attacks, and carry the War into their own Quarters, by displaying the equal Absurdity of their conjoining all Thought with a simple and indivisible Substance. For, says he,

> **the most vulgar Philosophy informs us, that no external Object can make itself known to the Mind immediately, and without the Interposition of an Image or Perception. That Table which just now appears to me, is only a Perception, and all its Qualities are Qualities of a Perception. Now the most obvious of all its Qualities is Extension. The Perception consists of Parts. These Parts are so situated, as to afford us the Notion of Distance and Contiguity; of Length, Breadth and Thickness. -- And, to cut short all Disputes, the very Idea of Extension is copied from nothing but an Impression, {397} and consequently must perfectly agree to it. To say the Idea of Extension agrees to any thing, it so say that thing is extended.**

This, as he adds, the Free-Thinker may exult in his Turn; and having found there are Impressions and Ideas really extended, may ask his Antagonists, how they can incorporate a simple and indivisible Subject with an extended Perception? All their Arguments recoil, as he evinces, on themselves; nor is it possible for them to evade their Force.

What he has said upon this Head, gives him an Occasion of re-entering on the Question concerning the Substance of the Soul; and though, as we have already seen, he has pronounced that Matter to be altogether unintelligible, yet he cannot forbear some farther Reflections thereon. He roundly asserts, that the Doctrine of the Immateriality, Simplicity, and Indivisibility of a thinking Substance, is a true Atheism, and will serve to justify all those Sentiments for which *Spinoza* is so universally infamous.

This, to many Readers, will appear the harshest of all the Paradoxes this Author has advanced. Alas! will they exclaim, Poor Dr. *Clarke*, is it thy Fate to be branded as a true Atheist? Thou illustrious, thou most learned, judicious, sincere, zealous, and yet candid Advocate for Natural and Revealed Religion; thou immortal Defender of the Immateriality and natural Immortality of thinking Substances! Shall all thy strong, thy clear, and unanswerable Arguments, as so many of the best Judges have esteemed them, be now levelled with the Dust, and trampled on with Abhorrence! This is indeed a lamentable Case; bust such is the absolute Pleasure of our Author, and we must submit: Neither *Locke*, nor *Clarke*, nor the most venerable Names, shall usurp the Place of Truth in his Affections. {398}

However, we are not to look upon this as an arbitrary Sentence; it is founded on Reason and Equity. To convince us hereof, our Author lays before us a Summary of *Spinozism*, which he terms an *hideous Hypotheses*, and then shews, first in general, and afterwards more particularly, in what Respects it agrees with the Doctrine of the Immaterialists; at the same time making it evident, that those Objections which have been urged against the former, are of equal Force against the latter also. His Reasoning upon this Subject still turns, in a great Measure, on his favourite Notion of the *Mind* being no continued Substance, but merely a Series of fleeting independent Perceptions.

When he has settled the Nature of thinking Beings, and corrected the atheistical Errors of the Immaterialists with Relation thereto, he proceeds to consider what those heterodox Gentlemen hold concerning the *Cause* of our Perceptions. And after a brief Rehearsal of their Paralogisms, to prove that Matter and Motion can never produce Thought, the seeming Evidence of which, he says, few have been able to withstand, he goes on to refute them, (than which, he says, nothing in the World is more easy) by the Application of his Doctrine of *Causality*, which the Reader has already seen in a foregoing Extract.[14] From what he has offered on this Point, he would have us certainly conclude, "That Matter may be, and actually is, the Cause of Thought and Perception." The Refusal of our Assent to this Proposition, reduces us to this Dilemma, either to assert, that nothing can be the Cause of another, but where the Mind can perceive the Connexion in its Idea of the Objects, which will exclude all Causes out of the Universe, not exception the Deity; or own that all Objects, which are found to be constantly conjoined, are upon that Account {399} only to be regarded as Causes and Effects, -- which evidently gives the Advantage to the Materialists above their Antagonists.

At the Close of this Section, our Author, in a very few Words, endeavours to shew, that what he has advanced with reference to this Point does not any way affect Religion. If his Philosophy, he says, makes no Addition to the Arguments for it, he has at least the Satisfaction to think it takes nothing from them, but that every thing remains precisely as before.

In the Section ensuing, he discourses at large of *personal Identity*. He specifies the Notions some Philosophers form of this Matter, in all which they pretend an absolute Certainty; but which, on the other hand, he proves to have no manner of Foundation. As for him, he can perceive nothing of the *Identity* these mistaken Men talk of. If they are conscious of something simple and continued, which they call *themselves*, he is certain there is no such Principle in him; and he may venture, he says, to affirm, that neither he nor the rest of Mankind are any thing but *a Bundle or Collection of different Perceptions, which succeed each other with an inconceivable Rapidity, and are in a perpetual Flux and Movement*. There is not, according to him, a single Power of the Soul which remains unalterably the same. There is properly no *Simplicity* in the Mind at one Time, nor *Identity* in different, whatever natural Propension we may have to imagine that Simplicity and Identity. Such a Propension it is undeniable we have, and he spends some Pages in making us know how we came by it, and how it imposes on us. Here he has occasion for the Principles he made use of in the second Section of this Part of his Work, and which we have said somewhat of in p. 88, *&c*. preceding, for explaining the *Principium Individuationis*; and he shews what {400} this is, and how we are inclined to conceive of it with regard to vegetable and inanimate Systems. Upon the same Principles, and by the same Method of Reasoning, he leads us to apprehend the Nature of *personal Identity*, or that which we ascribe to the Mind of Man. This, he says, is only a fictitious one, and of a like Kind with that which we attribute to Vegetables and animal Bodies, derived from the same Origin, and proceeding from a like Operation of the Imagination upon like Objects. He labours with great Assiduity to evince this notable Truth, as if his Readers were really to receive some

Benefit by the Belief of it. What he has offered upon this Head, puts and End to his Examination of the several Schemes of Philosophy, both of the intellectual and moral World. --

> **It is now Time, (he says) to return to a more close Examination of his Subject, and proceed in the accurate Anatomy of human Nature, having fully explained the Nature of our Judgment and Understanding.**

But (as he expresses himself in the seventh Section, wherewith he closes this Book) before he launches out into those immense Depths which lie before him, he finds himself inclined to stop a Moment in his present Situation, and to ponder that Voyage he himself has undertaken, and which undoubtedly requires the utmost Art and Industry to be brought to a happy Conclusion. Methinks, says he, (in a Strain that while it raises our Idea of his Resolution is yet enough to pierce the Heart of any human Reader)

> **I am like a Man, who, having struck on many Shoals, and having narrowly escaped Shipwreck in passing a small Frith, has yet the Temerity to put out to Sea in the same leaky weather-beaten Vessel; and even carries him Ambition so far, as to think of compassing the Globe under these disadvantageous {401} Circumstances. My Memory of past Errors and Perplexities, makes me diffident for the future. The Weakness and Disorder of the Faculties, I must employ in my Inquiries, increase my Apprehensions; and the Impossibility of amending or correcting these Faculties, reduces me almost to Despair, and makes me resolve to perish on the barren Rock on which I am at present, rather than venture myself upon that boundless Ocean which runs out into Immensity. This sudden View of my Danger strikes me with Melancholy; and as it is usual for that Passion, above all others, to indulge itself, I cannot forbear feeding my Despair with all those desponding Reflections, which the present Subject furnishes me with in such Abundance.**

I am first affrighted and confounded with that forlorn Solitude in which I am placed in my Philosophy, and fancy myself some strange uncouth Monster, who, not being able to mingle and unite in Society, has been expelled all human Commerce, and left utterly abandoned and disconsolate. Fain would I run into the Crowd for Shelter and Warmth; but cannot prevail with myself to mix with such Deformity. I call upon others to join me, in order to make a Company apart, but no one will hearken to me; every one keeps at a Distance, and dreads that Storm which beats upon me from every Side. I have exposed myself to the Enmity of all Metaphysicians, Logicians, Mathematicians, and even Theologians; and can I wonder at the Insults I must suffer? I have declared my Disapprobation of their Systems; and can I be surprised, if they should express a Hatred of mine and of my Person? When I look abroad, I foresee on every Side Dispute, Contradiction, Anger, Calumny {402} and Detraction. When I turn my Eye inward, I find nothing but Doubt and Ignorance; all the World conspires to oppose and contradict me, though such is my Weakness, that I feel all my Opinions loosen and fall of themselves, when unsupported by the Approbations of others; every Step I take is with Hesitation, and every new Reflection makes me dread an Error and Absurdity in my Reasoning.

What Heart now would not almost bleed? what Breast can forbear to sympathize with this brave Adventurer? For my part, I cannot, without the utmost Emotion and Solicitude, take even a transient Prospect of the Dangers and terrible Catastrophe to which he is exposed. Somewhat of these appears in the foregoing Citation; but we have a much larger melancholy Description of them in the Sequel of the Section from whence I copied it. However, after all, as it becomes us to

mourn with those that mourn, so it is but fitting we should rejoice with such as are joyful; and seeing our Author is so at certain Seasons, notwithstanding his tragical Circumstances, it would be ridiculous in us not to join in his Exhilerations. Take his own Account of the Matter, for it is impossible for any other Language in the World to express his Condition like that which he uses.

> The *intense* View (says he) of these manifold Contradictions and Imperfections in human Reason,[15] has so wrought upon me, and heated my Brain, that I am ready to reject all Belief and {403} Reasoning, and can look upon no Opinion even as more probable or likely than another. Where am I or what? from what Causes do I derive my Existence, and to what Condition shall I return? whose Favour shall I court, and whose Anger must I dread? what Beings surround me? and on whom have I any Influence, or who have any Influence on me? I am confounded with all these Questions, and begin to fancy myself in the most deplorable State imaginable, inviron'd with the deepest Darkness, and utterly deprived of the Use of every Member and Faculty.

This is a little Sketch of the dismal Part of the Scene; now it turns and presents a gay and chearing Aspect; for he immediately adjoins,

> Most fortunately it happens, that since Reason is incapable of dispelling these Clouds, Nature herself suffices to that Purpose, and cures me of this philosophical Melancholy and Delirium, either by relaxing this Bent of Mind, or by some Avocation and lively Impression of my Senses, which obliterate all these Chimera's, *I dine, I play a Game at Backgammon, I converse and am merry with my Friends*; and when, after three or four Hours Amusement, I would return to these Speculations, they appear so cold, and strain'd, and ridiculous, that I cannot find in my Heart to enter into them any farther. -- I am ready to throw all my Books and Papers into the Fire, and resolve never more to renounce the Pleasures of Life for the sake of Reasoning and Philosophy.

I will take Leave of our Author while he is in this chearful Mood, in this agreeable Situation; for, by looking forward, I perceive him extremely ready to relapse into profound Meditations on incomprehensible Subjects, and so into Scepticism, Chagrin, and all that gloomy frightful Train of Ideas from {404} whence he is but this Moment emerged. Whether I shall wait upon him any more, and venture with him into those immense Depths of Philosophy which he launches into in his second Volume, I am not yet determined. Perhaps I have already and sufficiently answered the End of this Article, which is to make the Treatise it refers to more generally known than I think it has been; to bring it, as far as I am able, into the Observation of the Learned, who are the proper Judges of its Contents, who will give a Sanction to its Doctrines, where they are true and useful, and who have Authority to correct the Mistakes where they are of a different Nature; and lastly, to hint to the ingenious Writer, whoever he is, some Particulars in his Performance, that may require a very serious Reconsideration. It bears indeed incontestable Marks of a great Capacity, of a soaring Genius, but young, and not yet thoroughly practiced. The Subject is vast and noble as any that can exercise the Understanding; but it requires a very mature Judgment to handle it as becomes its Dignity and Importance; the utmost Prudence, Tenderness and Delicacy, are requisite to this desirable Issue. Time and Use may ripen these Qualities in our Author; and we shall probably have Reason to consider this, compared with his later Productions, in the same Light as we view the *Juvenile* Works of *Milton*, or the first Manner of a *Raphael*, to other celebrated Painter.

Bracketed comments within the end notes are the editor's. This is a working draft. Please report errors to James Fieser (jfieser@utm.edu).]

[2]Our Author tells us, he makes use of these Terms in a Sense different from what is usual, and he hopes this Liberty will be allowed him. He thinks he rather restores the Word *Idea* to its original Sense, from which Mr. *Locke* had (as he is pleased to say) perverted it, in making it stand for all our Perceptions.

[3]This Work abounds throughout with *Egotisms*. The Author would scarcely use that Form of Speech more frequently, if he had written his own Memoirs.

[4]It may be a Question whether there are indeed any *abstract* or *general* Ideas; but surely there cannot be any such Query as this here stated: No-body, one would think in his Senses, can ask whether *abstract* or *general* Ideas be *general* or *particular* in the Mind's Conception of them?

[5]I have revolved this Sentence in my Mind till I have quite tired myself, but cannot, after all, find any Meaning in it. I do not mention this as a singular Instance of our Author's Inscrutability, for there are, to me, innumerable in this Work of his; but I could not point out a more short and entire one, whereby the Reader may judge how Qualified this Writer is to give us a clear Idea of so complex a Subject as Human Nature, or, with what Justice he tramples upon Mr. *Locke*, and pretends to restore or rectify what he has perverted. Mind, for this Purpose also, what immediately follows.

[6]The infinite Divisibility of Space is, I think, an Impropriety. Space is, in the strictest Sense, an *Individuum*; and though our Author has expressed himself as above, yet he seems by his subsequent *Reasoning* (if it may be so called) to intend by *Space*, *Matter*, or *solid* Extension.

[7]He might more reasonable have said, *the* Mind *may reach a* Minimum, *or be convinced of the Existence of* indivisible Atoms; for it is certain the Imagination never forms an Idea of partial Extension, but under some Figure: Now a Figure of which no Sub-division can be conceived, is as rank a Contradiction as any our Author censures in his whole Performance.

[7]This Axiom is somewhat like a Conjurer's *Hocus Pocus*; it works Wonders, and is at every Turn repeated. Let this Gentleman apply it once more in the Case before us; let him try if he can conceive in his Imagination a Grain of Sand, without conceiving a Surface; and let him try if he can imagine any Surface without at least two distinguishable, and consequently, according to his own Axiom, separable Sides.

[9]This Writer fancies a Difficulty where there is none. Difficulty implies a Possibility of the Thing

it relates to, and a Capacity in the Agent to accomplish it, when exerted* to the utmost, and attended with favourable Circumstances. But it is entirely above the Reach of the human Mind to form a just(if therepy* is meant an adequate) Notion of a Mite, or any Animal whatsoever.

[10]How subtle a Distinction is this between the Impossibility and Difficulty attending the different Systems. But in reality, there is not a Man in the Universe that can reap the least Benefit by it, except our Author himself. To every one else it is as impossible, upon one Supposition as on the other, to have a distinct Idea, representing every Part of an Insect a thousand times less than a Mite, not excluding even those of which its animal Spirits consist.

[15]The Reader who will consult the Original, will find a full Representation of these in the Paragraphs preceding this Extract. He will there likewise see, that they are the Source of most of those Calamities which our Author apprehends, or labours under.

Review of David Hume's *An Enquiry Concerning the Principles of Morals*

The Monthly Review

William Rose

January 1752

Editor's Note: This review appeared anonymously in January 1752, Volume 6, pages 1-19 of *The Monthly Review*. William Rose's authorship is established in Benjamin Christie Nangle's, *The Monthly Review First Series 1749-1789* (1934). Two editions were published of the January issue. The second edition contains minor differences in punctuation, spelling, and corrected printer's errors from the first edition. The first edition is followed here; printer's errors have been corrected without note.

The Monthly Review

Vol. 6

{1}

ART. I. *An Enquiry concerning the Principles' of Morals. By* David Hume, *Esq*; 12*mo*. 3*s*. Millar.

THE reputation this ingenious author has acquir'd as a fine and elegant writer, renders it unnecessary for us to say any thing in his praise. We shall only observe in general, that clearness and precision of ideas on abstracted and metaphysical subjects, and at the same time propriety, elegance and spirit, are seldom found united in any writings in a more eminent degree than in those of Mr. *Hume*. The work now before us will, as far as we are able to judge, considerably raise

his reputation; and, being free from that sceptical turn which appears in his other pieces, will be more agreeable to the generality of Readers. His subject is important and interesting, and the manner of treating it easy and natural: His design is to fix the just origin of morals, in the execution of which he has shewn a great deal of judgment as well as ingenuity, as every candid reader must needs allow, whatever sentences he may pass upon his scheme in general, or how much soever he may differ from him in regard to what he has advanced on the subject of justice.

In the first section of this performance, our author treats of the general principles of morals; he introduces it with some general reflections, after which he gives a short but clear view of the principal arguments that are urged to prove that morals are derived from *reason,* and of those which {2} are adduced to shew that they are derived from *sentiment.* The arguments on both sides he thinks are so plausible, that he is apt to suspect they may, both of them, be solid and satisfactory, and that reason and sentiment concur in almost all moral determinations and conclusions. 'But tho' this question, says he, concerning the general principle of morals, be extremely curious and important; 'tis needless for us, at present, to employ farther care in our enquiries concerning it. For if we can be so happy, in the course of this enquiry, as to fix the just origin of morals, 'twill then easily appear how far sentiment or reason enters into all determinations of this nature. Mean while, it will scarce be possible for us, e're this controversy is fully decided, to proceed in that accurate manner required in the sciences; by beginning with exact definitions of virtue and vice, which are the objects of our present enquiry. But we shall do what may be justly esteem'd as satisfactory. We shall consider the matter as an object of experience. We shall can *every quality or action of the mind,* virtuous*, which is attended with the general approbation of mankind*: and we shall denominate vicious*, every quality, which is the object of general blame or censure*. These qualities we shall endeavour to collect; and after examining, on both sides, the several circumstances, in which they agree, 'tis hoped, we may, at last, reach the foundation of ethics, and find those universal principles, from which all moral blame or approbation is ultimately derived. As this is a question of fact, not of abstract science, we can only expect success, by following this experimental method, and deducing general maxims, from a comparison of particular instances. The other scientifical method, when a general abstract principle is first established, and is afterwards branched out into a variety of inferences and conclusions, may be more perfect in itself, but suits less the imperfection of human nature, and is a common source of illusion and mistake, in this as well as in other subjects. Men are now cured of their passion for Hypotheses and systems in natural philosophy, and will hearken to no arguments but those derived from experience. 'Tis full time they should begin a like reformation in all moral disquisitions; and reject every system of ethics, however subtile or ingenious, that is not founded on fact and observation.

Having laid down the method he intends to prosecute, our Author proceeds in the second section to treat of benevolence; and shews how ill-founded that system of morals {3} is, which resolves all humanity and friendship into self-love. He makes it clearly appear that there is such a sentiment in human nature as disinterested benevolence; that nothing can bestow more merit on any human creature than the profession of it in an eminent degree; and that a part, at least, of its merit, arises from its tendency to promote the interests of our species, and bestow happiness on human society. "In all determinations of morality, says he, this circumstance of public utility is ever principally in view; and wherever disputes arise, whether in philosophy or common life, concerning the bounds of duty, the question cannot, by any means be decided with greater certainty, than by ascertaining, on any side, the true interests of mankind. If any false opinion, embraced from appearances, has

been found to prevail, as soon as farther experience, and sounder reasoning have given us juster notions of human affairs; we retract our first sentiments, and adjust a-new the boundaries of moral good and evil.'

In the third section our author treats of justice, and endeavours to shew that public utility is the *sole* origin of it, and that reflections on its beneficial consequences are the *sole* foundation of its merit. In order to make this appear, he puts a variety of cases, and supposes extreme abundance or extreme necessity to be produced among men; perfect moderation and humanity, or perfect rapaciousness and malice implanted in their breasts: In all these cases we are told, that by rendering justice totally *useless*, we thereby totally destroy its essence, and suspend its obligation upon mankind. 'The more, says he, we vary our views of human life; and the newer and more unusual the lights are, in which we survey it, the more shall we be convinced, that the origin here assigned for the virtue of justice is real and satisfactory.'

'Were there a species of creatures, intermingled with men, which, tho' rational, were possest of such inferior strength, both of body and mind, that they were incapable of all resistance, and could never, upon the highest provocation, make us feel the effects of their resentment; the necessary consequence, I think, is, that we should be bound by the laws of humanity, to give gentle usage to these creatures, but should not, properly speaking, lie under any restraint of justice with regard to them, nor could they possess any right or property, exclusive of such arbitrary Lords. Our intercourse with them could not be called society, which supposes a degree of equality; but absolute command on the one side, and servile obedience on the {4} other. Whatever we covet, they must instantly resign: Our permission is the only tenure, by which they hold their possessions: Our compassions and kindness the only check, by which they curb our lawless will: And as no inconvenience ever results from the exercise of a power, so firmly established in nature, and the restraints of justice and property being totally *useless*, would never have a place, in so unequal a confederacy.

"Were the human species so fram'd by nature as that each individual possest within himself every faculty, requisite both for his own preservation and for the propagation of his kink: Were all society and intercourse cut off betwixt man and man, by the primary intention of the supreme Creator: It seems evident, that so solitary a being would be as much incapable of justice, as of social discourse and conversation. Where mutual regards and forbearance serve to no manner of purpose, they would never direct the conduct of any reasonable man. The headlong course of the passions would be checked by no reflection on future consequences. And as each man is here supposed to love himself alone, and to depend only on himself and his own activity for safely and happiness, he would, on every occasion, to the utmost of his power, challenge the preference above every other being, to none of which he is bound by any ties, either of nature, or of interest.

'But suppose the conjunction of the sexes to be established in nature, a family immediately arises; and particular rules being found requisite for its subsistance, these are immediately embraced; tho' without comprehending the rest of mankind within their prescriptions. Suppose, that several families unite together into one society, which is totally disjoined from all others, the rules, which preserve peace and order, enlarge themselves to the utmost extent of that society; but, being entirely useless, lose their force when carried one step farther. But again suppose, that several distinct societies maintain a kind of intercourse for mutual convenience and advantage; the boundaries of justice still grow larger and larger, in proportion to the largeness of men's views, and the force of their mutual connexions. History, experience, reason sufficiently instruct us in this natural progress of human sentiments, and the gradual increase of our regards to property and

justice in proportion as we became acquainted with the extensive *utility* of that virtue.'

{5} After a short section upon political society, our Author proceeds in the fifth to shew why utility pleases. 'Usefulness, says he, is agreeable, and engages our approbation. This is a matter of fact, confirmed by daily observation. But *useful*? For what? For somebody's interest surely. Whose interest then? Not our own only: For our approbation frequently extends farther. It must, therefore, be the interest of those, who are serv'd by the character or action approved of; and these we may conclude, however remote, are not totally indifferent to us. -- Usefulness is only a tendency to a certain end; and 'tis a contradiction in terms, that any thing pleases as means to an end, where the end itself does no way affect us. If therefore usefulness be a source of moral sentiment, and if this usefulness be not always considered with a reference to self; it follows, that every thing, which contributes to the happiness of society, recommends itself directly to our approbation and good-will. Here is a principle, which accounts, in great part, for the origin of morality: And what need we seek for abstruse and remote systems, when there occurs one so obvious and natural?'

Our author employs several pages in illustrating this principle, and concludes the section in the following manner. 'Thus, says he, in whatever light we take this subject, the merit, ascrib'd to the social virtues, appears still uniform, and arises chiefly from that regard, which the natural sentiment of benevolence engages us to pay to the interests of mankind and society. If we consider the principles of the human make, such as they appear to daily experience and observation; we mus, *a priori*, conclude it impossible for such a creature as man to be totally indifferent to the well or ill-being of his fellow-creatures, and not readily, of himself, to pronounce, where nothing gives him any particular byass, that what promotes their happiness is good, what tends to their misery is evil, without any farther regard or consideration. Here then are the faint rudiments, at least, or outlines, of a general distinction betwixt actions; and in proportion as the humanity of the person is supposed to encrease, his connexion to those injured or benefited, and his lively conception of their misery or happiness; his consequent censure or approbation acquires proportionable force and vigour. There is no necessity, that a generous action, barely mentioned in an old history or remote Gazette, should communicate any strong feelings of applause and admiration. Virtue, placed at such a distance, {6} is like a fixt star, which tho', to the eye of reason, it may appear as luminous as the sun in his meridian, is so infinitely removed, as to affect the senses neither with light nor heat. Bring this virtue nearer, by our acquaintance or connexion with the persons, or even by an eloquent narration and recital of the case; our hearts are immediately caught, our sympathy enliven'd, and our cool approbation converted into the warmest sentiments of friendship and regard. These seem necessary and infallible consequences of the general principles of human nature, as discovered in common life and practice.

'Again; reverse these views and reasonings: Consider the matter *a posteriori*; and weighing the consequences, enquire, if the merit of all social virtue is not derived from the feelings of humanity, with which it affects the spectators. It appears to be matter of fact, that the circumstances of *utility* in all subjects, is a source of praise and approbation: that it is constantly appeal'd to in all moral decisions concerning the merit and demerit of actions: That it is the *sole* source of that high regard paid to justice, fidelity, honour, allegiance and chastity: That it is inseparable from all the other social virtues of humanity, generosity, charity, affability, lenity, mercy and moderation: and in a word that it is the foundation of the chief part of morals, which has a reference to mankind and society.

'It appears also, in our general approbation or judgment of characters and manners, that the useful tendency of the social virtues moves us not by any regards to self-interest, but has an

influence much more universal and extensive. It appears, that a tendency to public good, and to the promoting of peace, harmony, and concord in society, by affecting {7} the benevolent principles of our frame, engages us on the side of the social virtues. And it appears, as an additional confirmation, that these principles of humanity and sympathy enter so deep into all our sentiments, and have so powerful an influence, as may enable them to excite the strongest censure and applause. The present theory is the simple result of all these inferences, each of which seems founded on uniform experience and observation.

'Were it doubtful, whether there was any such principle in our nature and humanity or a concern for others, yet when we see, in numberless instances, that, whatever has a tendency to promote the interests of society, is so highly approv'd of, we ought thence to learn the force of the benevolent principle; since 'tis impossible for any thing to please as a means to an end, where the end itself is totally indifferent. On the other hand, were it doubtful, whether there was, implanted in our natures, any general principle of moral blame and approbation, yet when we see, in numberless instances, the influence of humanity, we ought thence to conclude, that 'tis impossible, but that every thing, which promotes the interest of society, must communicate pleasure, and what is pernicious give uneasiness. But when these different reflections and observations concur in establishing the same conclusion; must they not bestow an undisputed evidence upon it?

''Tis however hoped, that the progress of this argument will bring a farther confirmation of the present theory, by showing the rise of other sentiments of esteem and regard from the same or like principles.'

The sixth section treats of qualities useful to ourselves. It is introduced with the following just observation, *viz*. that nothing is more usual, than for philosophers to encroach upon the province of *Grammarians*, and to engage in disputes of words, while they imagine, that they are handling controversies of the deepest importance and concern. 'Thus, says our author, were we here to assert or to deny, *that all laudable qualities of the mind were to be considered as virtues or moral attributes*, many would imagine, that we had entered upon one of the profoundest speculations of Ethics; tho' tis probable, all the while , that the greatest part of the dispute would be found entirely verbal.' After this he makes the two following observations; that, in common life, the sentiments of censure or approbation, produced by mental qualities of every kind, are very similar; and that all antient moralists, (the best models) in treating of them, make little or no difference amongst them. These observations he confirms and illustrates, in the subsequent part of the section, with great beauty and elegance; shews that all the qualities, useful to the possessor, are approved, and the contrary censured; and examines that influence of bodily endowments and of the goods of fortune, over our sentiments of regard and esteem.

In the seventh section, which treats of qualities immediately agreeable to ourselves, our author shews that there is another set of virtues, such as chearfulness, dignity of character, courage and serenity of mind, which, without any utility or any tendency to farther good, either of the {8} community or of the possessor, diffuse a satisfaction on the beholders, conciliate friendship and regard, and are praised from the immediate pleasure, which they communicate to the person possest of them. This section too is very entertaining, and contains several beautiful illustrations drawn from celebrated characters both in ancient and modern times.

In the eighth section our author treats of qualities immediately agreeable to others, such as politeness, wit, the lively spirit of dialogue in conversation, eloquence, modesty, decency, &*c*. and shews that, abstracted from any regard to utility or beneficial tendencies, they conciliate affection,

promote esteem, and greatly inhance the merit of the possessor. He closes this section in the following manner. 'Amongst the other virtues, says he, we may also give cleanliness a place; since it naturally renders us agreeable to others, and is no inconsiderable source of love and affection. No one will deny, that a negligence in this particular is a fault; and as faults are nothing but smaller vices, and this fault can have no other origin than the uneasy sensation, which it excites in others; we may, in this instance, seemingly so trivial, clearly discover the origin of moral distinctions, about which the learned have involved themselves in such mazes of perplexity and error.'

'But besides all the agreeable qualities, the origin of whose beauty we can, in some degree, explain and account for, there still remains something mysterious and unaccountable, which conveys and immediate satisfaction to the spectators, but how, or why, or for what reason, they cannot pretend to determine. There is a manner, a grace, a genteelness, an I-know-not-what, which some men possess above others, which is very different from external beauty and comeliness, and which, however, catches our affection almost as suddenly and powerfully. And tho' this *manner* be chiefly talked of in the passion betwixt the sexes, where the concealed magic is easily explained, yet surely much of it prevails in all our estimation of characters, and forms no inconsiderable part of personal merit. this class of virtues, therefore, must be trusted entirely to the blind but sure testimony of taste and sentiment; and must be considered as a part of ethics, left by nature to baffle all the pride of philosophy, and make her sensible of her narrow boundaries and slender acquisitions."

{9} 'We approve of another, because of his wit, politeness, modesty, decency, or any agreeable quality he possesses, although he be not of our acquaintance, nor has ever given us any entertainment, by means of these accomplishments. The idea, which we form of their effect on his acquaintance, has an agreeable influence on our imagination, and gives us the sentiment of approbation. This principle enters into all the judgments which we form concerning morals.'

The ninth section, which is the conclusion of the whole, our author introduces with observing that it may appear surprising, that any man, in so late an age should find it requisite to prove, by elaborate reasonings, that virtue or personal merit consists altogether in the possession of qualities, *useful or agreeable* to the *person himself* or to *others*. 'It might be expected, says he, that this principle would have occurred even to the first rude, unpractised enquirers concerning morals, and been received, from its own evidence, without any argument or disputation. Whatever is valuable in any kind so naturally classes itself under the division of *useful* or *agreeable*, the *utile* or the *dulce*, that it is not easy to imagine, why we should ever seek farther, or consider the question as a matter of nice research or enquiry. And as every thing useful or agreeable must possess these qualities with regard either to the *person himself* or to *others*, the compleat delineation or description of merit seems to be performed as naturally as a shadow is cast by the sun, or an image is reflected upon water. If the ground, on which the shadow is cast, be not broken and uneven, nor the surface, from which the image is reflected, disturbed and confused, a just figure is immediately presented, without any art or attention. And it seems a reasonable presumption, that systems and hypotheses have perverted our natural understanding, when a theory, so simple and obvious, could so long have escaped the most elaborate scrutiny and examination.

'But however the case may have fared with philosophy; in common life these principles are still implicitely maintained; nor is any other topic of praise or blame ever recurred to, when we employ and panegyric or satire, any applause or censure of human action and behaviour. If we observe men, in every intercourse of business or pleasure, in each conference and conversation, we shall find them no where, except in the schools, at any loss upon the subject. --

{10} 'And as every quality, which is useful or agreeable to ourselves or others, is, in common life, admitted under the denomination of virtue or personal merit; so no other will ever be received, where men judge of things by their natural unprejudiced reason, without the delusive glosses of superstition and false religion. Celibacy, fasting, penances, mortification, self-denial, humility, silence, solitude and the whole train of monkish virtues; for what reason are they every where rejected by men of sense, but because they serve to no manner of purpose; neither advance a man's fortune in the world, nor render him a more valuable member of society; neither qualify him for the entertainment of company, nor encrease his power of self-enjoyment? We observe, on the contrary, that they cross all these desirable ends; stupify the understanding, and harden the heart, obscure the fancy and sower the temper. We justly therefore transfer them to the opposite column, and place them in the catalogue of vices; nor has any superstition force sufficient, amongst men of the world, to pervert entirely these natural sentiments. A gloomy hair-brained enthusiast, after his death, may have place in the calendar; but will scarce ever be admitted, when alive, into intimacy and society, except by those who are as delirious and dismal as himself.'

Our author does not enter into that vulgar dispute concerning the *degrees* of benevolence or self-love, which prevail in human nature; a dispute, which, as he justly observes, is never likely to have any issue, both because men, who have taken party, are not easily convinced, and because the phaenomena, which can be produced on either side, are so uncertain, and subject to such a variety of interpretations, that it is impossible accurately to compare them, or draw any determinate conclusion from them. He thinks it sufficient for his purpose, if it be allowed that there is some benevolence, however small, infused into our bosom; some spark of friendship for human kind, some particle of the dove kneaded into our frame, along with the elements of the wold and serpent. "Let these generous sentiments, says he, be supposed ever so weak; let them be hardly sufficient to move even a hand or finger of our body; they must still direct the determinations of the mind, and where every thing else is equal, produce a cool preference of what is useful and serviceable to mankind, above what is pernicious and dangerous. A *moral distinction*, therefore, immediately arises; a general sentiment of blame and approbation; {11} a tendency, however faint, to the objects of the one, and a proportionable aversion to those of the other.'

Avarice, ambition, vanity, and all those passions that are vulgarly comprehended under the denomination of *self-love*, are excluded from our author's theory concerning the origin of morals, not because they are too weak, but because they have not a proper direction for that purpose. 'The notion of morals, says he, implies some sentiment, common to all mankind, which recommends the same object to general approbation, and makes every man, or most men, agree in the same opinion or decision concerning it. It also implies some sentiment, so universal and comprehensive as to extend to all mankind, and render the actions and conduct, even of persons the most remote, an object of censure or applause, according as they agree or disagree with that rule of right which is established. These two requisite circumstances belong alone to the sentiment of humanity here insisted on. The other passions produce, in every breast, many strong sentiments of desire and aversion, affection and hatred; but these neither are felt to much in common, nor are so comprehensive, as to be the foundation of any general system and established theory of blame or approbation.

'When a man denominates another his *enemy*, his *rival*, his *antagonist*, his *adversary*, he is understood to speak the language of self-love, and to express sentiments peculiar to himself, and arising from his particular circumstances and situation: but when he bestows on any man the epithets of *vicious* or *odious*, or *depraved*, he then speaks another language, and expresses

sentiments, in which he expects all his audience are to concur with him. He must here, therefore, depart from his private and particular situation, and must choose a point of view, common to him with others: he must move some universal principle of the human frame, and touch a string, to which all mankind have an accord and symphony. If he means, therefore, to express, that this man possesses qualities, whose tendency is pernicious to society, he has chose this common point in view, and has touched the principle of humanity, in which every man, in some degree, concurs. While the human heart is compounded of the same elements as present, it will never be altogether indifferent to the good of mankind, nor entirely unaffected with the tendencies of characters and manners. And tho' this affection of humanity may not generally be esteemed so strong as ambition or vanity, yet, being common to all men, it can alone be the foundation of morals, or of any {12} general system of conduct and behaviour. One man's ambition is not another man's ambition; nor will the same event or object satisfy both: but the humanity of one man is the humanity of every one; and the same object touches this passion in all human creatures.

'But the sentiments which arise from humanity, are not only the same in all human creatures, and produce the same approbation or censure; but they also comprehend all human creatures: nor is there any one, whose conduct and character is not, by their means, an object, to every one, of censure or approbation. On the contrary those other passions, commonly denominated selfish, both produce different sentiments in each individual, according to his particular situation; and also contemplate the greatest part of mankind with the utmost indifference and unconcern. Whoever has a high regard and esteem for me flatters my vanity; whoever expresses contempt mortifies and displeases me: but as my name is known but to a small part of mankind, there are few, that come within the sphere of this passion, or excite, on its account, either my affection or disgust. But if you represent a tyrannical, insolent, or barbarous behaviour, in any country or in any age of the world; I soon carry my eye to the pernicious tendency of such a conduct, and feel the sentiment of repugnance and displeasure toward it. No character can be so remote as to be, in this light, altogether indifferent to me. What is beneficial to society or to the person himself must still be preferred. And every quality or action, of every human being, must by this means, be ranked under some class or denomination, expressive of general censure or applause.

'What more, therefore, can we ask to distinguish the sentiments, dependant on humanity, from those connected with any other passion, or to satisfy us why the former is the origin of morals, and not the latter? Whatever conduct gains my approbation, by touching my humanity, procures also the applause of all mankind, by affecting the same principle in them: but what serves my avarice or ambition pleases only these passions in me, and affects not the avarice or ambition of the rest of mankind. No conduct, in any man, which has a beneficial tendency, but is agreeable to my humanity, however remote to the person: but every man, so far removed as neither to cross nor serve my avarice and ambition, is altogether indifferent to those passions. The distinction, therefore, betwixt these different {13} species of sentiment being so strong and evident, language must soon be moulded upon it, and must invent a peculiar set of terms to express those universal sentiments of censure or approbation, which arise from humanity or from views of general usefulness and its contrary. Virtue and vice become then known: morals are recognized: certain general ideas are framed of human conduct and behaviour: such measures are expected from men in such situations: this action is determined conformable to our abstract rule; that other, contrary. And by such universal principles are the particular sentiments of self-love frequently controuled and limited.'

In the remaining part of this section the author briefly considers our *obligation* to virtue, and

shews that every man, who has any regard to his own happiness and welfare, will best find his account in the practice of every moral duty.

There are two appendixes subjoined to the work, in the first of which the author examines how far either *reason* or *sentiment* enters into all moral determinations. 'The chief foundation, says he, of moral praise being supposed to lie in the usefulness of any quality of action; it is evident, that *reason* must enter for a considerable share in all determinations of this kind; since nothing but that faculty can instruct us in the tendency of qualities and actions, and point out their beneficial consequences to society and to their professors. In many cases this is an affair liable to great controversy: doubts may arise, opposite interests occur; and a preference must be given to one side, from very nice views and a small over balance of utility. This is particularly remarkable in questions with regard to justice; as is, indeed natural to suppose from that species of utility which attends this virtue. Were every single instance of justice, like that of benevolence, beneficial and useful to society; this would be a more simple state of the case, and seldom liable to great controversy. But as single instances of justice are often pernicious in their first and immediate tendency, and as the advantage to society results only from the observance of he general rule, and from the concurrence and combination of several persons in the same equitable conduct; the case here becomes more intricate and involved. The various circumstances of society; the various consequences of any practice; the various interests which may be proposed: these on many occasions are doubtful, and subject to great discussion and enquiry. The object of municipal is to fix all questions with regard to justice: the debates of civilians; the reflections {14} of politicians; the precedents of histories and public records, are all directed to the same purpose. And a very accurate *reason* or *judgment* is often requisite, to give true determination, amidst such intricate doubts arising from obscure or opposite utilities.

'But tho' reason, when fully assisted and improved, be sufficient to instruct us in the pernicious or useful tendencies of qualities and actions; it is not alone sufficient to produce any moral blame or approbation. Utility is only a tendency to a certain end; and were the end totally indifferent to us, we should feel the same indifference towards the means. It is requisite a *sentiment* should here display itself, in order to give a preference to the useful above the pernicious tendencies. This sentiment can be no other than a feeling for the happiness of mankind, and a resentment of their misery; since these are the different ends which virtue and vice have a tendency to promote. Here therefore, *reason* instructs us in the several tendencies of action, and *humanity* makes a distinction in favour of those, which are useful and beneficial'

After this our author proceeds to shew the absurdity of supposing reason to be the sole source of morals, an absurdity which he places in the clearest and strongest light, and concludes this his first appendix in the following manner. 'Thus, says he, the distinct boundaries of offices of *reason* and *taste* are easily ascertained. The former conveys the knowledge of truth and falshood: the latter gives the sentiment of beauty and deformity, vice and virtue. The one discovers objects, as they really stand in nature, without addition or diminution: the other has a productive faculty, and gilding or staining all natural objects with the colours borrowed from internal sentiment, raises in a manner a new creation. Reason, being cool and disengaged, is no motive to action, and directs only the impulse received from appetite or inclination, by shewing us the means of obtaining happiness or avoiding misery: taste, as it gives pleasure or pain, and thereby constitutes happiness or misery, becomes a motive to action, and is the first spring or impulse to desire and volition. From circumstances and relations, known or supposed, the former leads us to the discovery of the concealed and unknown: after all circumstances and relations are laid before us, the latter makes

us feel from the whole a new sentiment of blame or approbation. The standard of the one being founded on the nature of things, is eternal and inflexible, even by the will of the supreme {15} being: the standard of the other, arising from the internal frame and constitution of animals, is ultimately derived from that supreme will, who bestowed on each being its peculiar nature, and arranged the several classes and orders of existence.'

In the second appendix, our author gives a more particular explication of the origin and nature of justice; and marks some differences betwixt it and the other virtues. He observes, that, the social virtues of humanity and benevolence, exert their influence immediately, by a direct tendency or instinct, which keeps chiefly in view the simple object that moves the affections, and comprehends not any scheme or system, nor the consequences resulting from the concurrence, imitation, or example of others; but that the case is different with the social virtues of justice and fidelity. 'They' says he, 'are highly useful, or indeed absolutely necessary to the well-being of mankind; but the benefit resulting from them, is not the consequences of every individual single act; but arises from the whole scheme or system, concurred in by the whole, or the greatest part of the society. General peace and order is the attendant of justice, or a general abstinence from the possessions of others; but a particular regard to the particular right of one individual citizen, may frequently, considered in itself, be attended with pernicious consequences. The result of the several acts is here often directly opposite to that of the whole system of actions; and the former may be extremely hurtful, while the latter is, to the highest degree, advantageous. Riches inherited from a parent, are, in a bad man's hand, the instruments of mischief. The right of succession may, in one instance, be hurtful. Its benefit arises only from the observance of the general rule; and it is sufficient, if compensation be thereby made, for all the ills and inconveniencies, which flow from particular characters and situations.

The happiness and prosperity of mankind, arising from the social virtues of benevolence and its subdivisions, may be compared to a wall, built by many hands; which still rise by each stone that is put upon it: and receives proportionable increase to the diligence and care of each workman. The same happiness, raised by the social virtue of justice and its subdivisions, may be compared to the building of a vault, where each individual stone, would, of itself, fall to the ground; nor does the whole fabric support {16} itself, but by the mutual assistance and combination of its correspondent parts.

'All the laws of nature, which regulate property, as well as all civil laws, are general; and regard alone some essential circumstances of the case, without taking into consideration the characters, situations and connexions of the persons concerned, or any particular consequences, that may result from the determination of these laws, in every particular case that offers. The deprive, without scruple, a beneficent man of all his possessions, if acquired by mistake, without a good title in order to bestow them on a selfish miser, who has already heaped up immense stores of superfluous riches. Publick utility requires, that property should be regulated by general inflexible rules; and though such rules are adopted as best serve the same end of public utility, it is impossible for them to prevent all particular hardships, or make beneficial consequences result from every individual case. It is sufficient, if the whole plan or scheme be necessary to the support of civil society, and if the balance of good, in the main, does thereby preponderate much above that of evil. Even the general laws of the universe, though planned by infinite wisdom, cannot exclude all evil or inconvenience, in every particular operation.'

After this our author proceeds to consider in what sense justice may be said to arise from human conventions. 'If by *convention*,' says he, 'be here meant a *promise* (which is the most usual sense of

the word) nothing can be more absurd, than this position. The observance of promises is itself, one of the most considerable parts of justice; and we are not surely bound to keep our word, because we have given our word to keep it. But if by convention, be meant a sense of common interest; which sense each man feels in his own breast, which he observes in his fellows, and which carries him, in concurrence with others, into a general plan or system of actions, that tends to public utility; it must be owned, that, in this sense, justice arises from human conventions. For if it be allowed (what is, indeed, evident) that the particular consequences of a particular act of justice, may be hurtful to the public as well as to individuals; it follows, that every man, in embracing that virtue, must have an eye to the whole plan or system, and must expect the concurrence of his fellows in the same conduct and behaviour. Were all his views to terminate in the particular consequences of each particular act of {17} his own, his benevolence and humanity, as well as self-love, might often prescribe to him measures of conduct very different from these, which are agreeable to the strict rules of right and justice.

'Thus two men pull the oars of a boat, by common convention, for common interest, without any promise or contract,; thus gold and silver are made the measures of exchange; thus speech and words and language are fixt, by human convention and agreement. Whatever is advantageous to two or more persons, if all perform their part; but what loses all advantage, if only one perform, can arise from no other principle. There would otherwise be no motive for any one of them to enter into that scheme of conduct.

'The word, *natural*, is commonly taken in so many senses, and is of such loose signification, that it seems to little purpose to dispute, whether justice is natural or not. If self-love, if benevolence be natural to man; if reason and fore-thought be also natural; then may the same epithet be applied to justice, order, fidelity, property, society. Men's inclination, their necessities lead them to combine; their understanding and experience tell them, that this combination is impossible, where each governs himself by no rule, and pays no regard to the possessions of others; and from these passions and reflections conjoined, as soon as we observe like passions and reflections in others, the sentiment of justice, through all ages, has infallibly and certainly had place, to some degree or other, in every individual of human species. In so sagacious an animal, what necessarily arises from the exertion of his intellectual faculties may justly be esteemed natural.

'Amongst all civilized nations, it has been the constant endeavour to remove every thing arbitrary and partial from the decision of property, and to fix the sentence of judges by such general views and considerations, as may be equal to every member of the society. For besides, that nothing could be more dangerous than to accustom the bench, even the smallest instance, to regard private friendship or enmity; it is certain, that men, where they imagine that there was no other reason for the preference of their adversary, but personal favour, are apt to entertain the strongest jealousy and ill-will against the magistrates and judges. When natural reason, therefore, points out no fixt view of public utility, by which a controversy of property can be decided, positive laws are often framed to supply its place, and direct the procedure of all courts of {18} judicature. Where these two fail, as often happens, precedents are called for; and a former decision, though given itself without any sufficient reason, justly becomes a sufficient reason for a new decision. If direct laws and precedents be wanting, imperfect and indirect ones are brought in aid; and the controverted case is ranged under them, by analogical reasonings, and comparisons, and similitudes, and correspondencies, that are often more fanciful than real. In general, it may easily be asserted, that jurisprudence is, in this respect, different from all the sciences; and in may of its nicer questions, there cannot properly be said to be truth or falshood on either side. If one pleader brings the case

under any former law or precedent, by a refined analogy or comparison, the opposite pleader is not a a loss to find an opposite analogy or comparison; and the preference given by the judge, is often founded more on taste and imagination than on any solid argument. Public utility is the general view of all courts of judicature; and this utility too requires a staple rule in all controversies; but where several rules, nearly equal and indifferent, present themselves, 'tis a very slight turn of thought, which fixes the decision in favour of either party.'

Our author concludes his ingenious performance with a very entertaining dialogue, wherein he presents us with a picture of *Athenian* and *French manners*, to shew what wide differences, in the sentiments of morals, are to be found betwixt different nations. He endeavours to make it appear, that the principles, upon which men reason, in morals, are always the same; though the conclusions they draw, are often very different. 'As many ages, says he, as have elapsed, since the fall of *Greece* and *Rome*, and such changes as have arrived in religion, language, laws and customs, none of these revolutions have ever produced any considerable innovation in the primary sentiments of morals, more than in those of external beauty. Some minute differences, perhaps, may be observed in both, *Horace* celebrates a low forehead, and *Anacreon* joined eye-brows; but the *Apollo* and the *Venus* of antiquity, are still our models for male and female beauty; in like manner, as the character of *Scipio* continues our standard for the glory of heroes, and that of *Cornelia* for the honour of matrons.

'It appears, that there never was any quality, recommended by any one, as a virtue of moral excellence; but on account of its being *useful*, or *agreeable* to a man *himself*, or to others. For what other reason can there ever be {19} for praise or approbation? Or where would be the sense of extolling a *good* character or action, which at the same time, is allowed to be *good for nothing*? All the differences, therefore, in morals, may be reduced to this one general foundation, and may be accounted for by the different views which people take of these circumstances.'

Four Dissertations. 1. The Natural History of Religion. 2. Of the Passions. 3. Of Tragedy. 4. Of the Standard of Taste. By David Hume, *Esq*; 12mo. 3s. Millar.

THERE are but few of our modern Writers, whose works are so generally read, as those of Mr. Hume. And, indeed, if we consider them in one view, as sprightly and ingenious compositions, this is not at all to be wondered at: there is a delicacy of sentiment, an original turn of thought, a perspicuity, and often an elegance, of language, that cannot but recommend his writings to every Reader of taste. It is to be regretted, however, that such a genius should employ his abilities in the manner he frequently does. In his attacks upon the religion of his country, he acts not the part of an open and generous enemy, but endeavours to weaken its authority by oblique hints, and artful insinuations. In this view his works merit little, if any regard; and few Readers, of just discernment, we apprehend, will envy him any honours his acuteness, or elegance, can possibly

obtain, when they are only employed in filling the mind with the uncomfortable fluctuations of scepticism, and the gloom of infidelity. But leaving the general reflections, let us proceed to give an account of the Dissertations now before us; the first of which is entitled, *The Natural History of Religion*.

This Dissertation Mr. Hume introduces with observing, that there are two questions in regard to religion, which challenge our principal attention, viz. that concerning its foundation in reason, and that concerning its origin in human nature. The first question, which is the most important, admits, he says, of the clearest solution. The whole frame of nature bespeaks an intelligent Author; and no rational enquirer can, after serious reflection, suspend his belief a moment with regard to the primary principles of genuine theism and religion. But the other question, concerning the origin of religion in human nature, admits of some more difficulty. The belief of invisible intelligent power, has been very generally diffused over the human race, in all places, and in all ages; but it has neither, perhaps, been so universally, we are told, as to admit of no exceptions, nor has it been, in any degree, uniform in the ideas which it has suggested. Some nations have been discovered, who entertained no sentiments of religion, if travellers and historians may be credited; and no two nations, and scarce any two men, have ever agreed precisely in the same sentiments. {123}

"It would appear, therefore," continues Mr. Hume, "that this pre-conception springs not from an original instinct, or primary impression of nature, such as gives rise to self-love, affection betwixt the sexes, love of progeny, gratitude, resentment; since every instinct of this kind has been found absolutely universal in all nations and ages, and has always a precise, determinate object, which it inflexibly pursues. The first religious principles must be secondary; such as may easily be perverted by various accidents and causes, and whose operation too, in some cases, may, by an extra-ordinary concurrence of circumstances, be altogether prevented. What those principles are, which give rise to the original belief, and what those accidents and causes are, which direct its operation, is the subject of our present enquiry?"

Mr. Hume is of opinion, that if we consider the improvement of human society, from rude beginnings to a state of greater perfection, it will appear that Polytheism of Idolatry, was, and necessarily must have been, the first and most antient religion of mankind. In order to support this opinion, he observes, that the farther we mount up into antiquity, the more we find mankind plunged into Idolatry. The North, the South, the East, the West, give their unanimous testimony to this fact: As to the doubtful and sceptical principles of a few Philosophers, or the Theism, and that too not entirely pure, of one or two nations, these form no objection worth regarding. According to the natural progress of human thought too, he says, the ignorant multitude must first entertain some groveling and familiar notion of superior powers, before they stretch their conception to that perfect Being, who bestowed order on the whole frame of nature: and we may as reasonably imagine, that men inhabited palaces before huts and cottages, or studied geometry before agriculture, as assert, that the Deity appeared to them a pure spirit, omniscient, omnipotent, and omnipresent, before he was apprehended to be a powerful, though limited Being, with Human passions and appetites, limbs, and organs. In a word, our Author thinks it impossible, that theism could, from reasoning, have been the primary religion of the human race, and have afterwards, by its corruption, given birth to Idolatry, and to all the various superstitions of the Heathen world.

If we would therefore indulge our curiosity, he says, in enquiring concerning the origin of religion, we must turn our thoughts towards Idolatry or Polytheism, the primitive religion of uninstructed mankind. And here he observes, that if {124} men were led into the apprehension of invisible, intelligent power, by a contemplation of the works of nature, they could never possibly entertain

any conception but of one single Being, who bestowed existence and order on this vast machine, and adjusted all its parts, according to one regular plan, or connected system. On the other hand, if, leaving the works of nature, we trace the footsteps of invisible power, in the various and contrary events of human life, we are necessarily led into Polytheism, and to the acknowledgement of several limited and imperfect Deities. Storms and tempests ruin what is nourished by the sun; the sun destroys what is fostered by the moisture of dews and rains. War may be favourable to a nation, whom the inclemency of the seasons afflicts with famine: sickness and pestilence may depopulate a kingdom, amidst the most profuse plenty. In short, the conduct of events, or what we call the plan of a particular Providence, is so full of variety and uncertainty, that if we suppose it immediately ordered by any intelligent Being, we must acknowledge a contrariety in their designs and intentions, a constant combat of opposite powers, and a repentance, or change of intention in the same power, from impotence or levity.

It may be concluded therefore, Mr. Hume imagines, that in all nations which have embraced Polytheism, or Idolatry, the first ideas of religion arose not from a contemplation of the works of nature; but from a concern with respect to the events of life, and from the incessant hopes and fears which actuate the human mind. Accordingly we find, it is said, that all Idolaters, having separated the provinces of their Deities, have recourse to that invisible agent, to whose authority they are immediately subjected, and whose province it is to superintend that course of actions, in which they are at any time engaged. Juno is invoked at marriages; Lucina at births; Neptune receives the prayers of seamen; and Mars of warriors. Each natural event is supposed to be governed by some intelligent agent; and nothing prosperous, or adverse can happen in life, which may not be the subject of peculiar prayers or thanksgivings.

In further treating of this subject, Mr. Hume observes, that we are placed in this world as in a great theatre, where the true springs and causes of every event, are entirely unknown to us; nor have we either sufficient wisdom to foresee, or power to prevent, those ills with which we are continually threatened. We hang in perpetual suspence betwixt life and death, health and sickness, plenty and want; which are distributed amongst the human species by secret and unknown {125} causes, whose operation is oft unexpected, and always unaccountable. These *unknown causes* then, we are told, become the constant object of our hope and fear; and while the passions are kept in perpetual alarm by an anxious expectation of the events, the imagination is equally employed in forming ideas of those powers, on which we have so entire a dependence. No wonder then, Mr. Hume says, that mankind being placed in such an absolute ignorance of causes, and being at the same time so anxious concerning their future fortunes, should immediately acknowledge a dependance on invisible powers, possessed of sentiment, and intelligence. The *unknown causes*, which continually employ their thought, appearing always in the same aspect, are all apprehended to be of the same kind of species. Nor is it long before we ascribe to them thought, and reason, and passion, and sometimes even the limbs and figures of men, in order to bring them nearer to a resemblance with ourselves.

Our Author goes on to consider the gross Polytheism and Idolatry of the vulgar, and to trace all its various appearances in the principles of human nature, whence they are derived. Whoever learns by argument, he observes, the existence of invisible, intelligent power, must reason from the admirable contrivance of natural objects, and must suppose the world to be the workmanship of that Divine Being, the original cause of all things. But the vulgar polytheist, so far from admitting that idea, defies every part of he universe, and conceives all the conspicuous productions of nature to be themselves so many real Divinities. The sun, moon, and stars, are all Gods, according to his

system: fountains are inhabited by nymphs, and trees by hamadryads: even monkies, dogs, cats, and other animals, often become sacred in his eyes, and strike him with a religious veneration. And thus, however strong men's propensity to believe invisible, intelligent power, in nature, their propensity is equally strong to rest their attention on sensible, visible objects; and in order to reconcile these opposite inclinations, they are led to unite the invisible power with some visible object.

Mr. Hume observes further, that the Deities of the vulgar are so little superior to human creatures, that where men are affected with strong sentiments of veneration or gratitude, for any hero, or public benefactor, nothing can be more natural than to convert him into a God, and fill the Heavens after this manner, with continual recruits from amongst mankind. Most of the Divinities of the antient world are supposed to have once been men, and to have been beholden for their *apotheosis* {126} to the admiration and affection of the people. And the real history of their adventures, corrupted by tradition, and elevated by the marvellous, became a plentiful source of fable; especially in passing through the hands of Poets, Allegorists, and Priests, who successfully improved upon the wonder and astonishment of the ignorant multitude.

Polytheism, or idolatrous worship, he says, being founded entirely in vulgar traditions, is liable to this great inconvenience, that any practice, or opinion, however barbarous or corrupted, may be authorized by it; and full scope is left for knavery to impose on credulity, till morals and humanity be expelled from the religious systems of mankind. At the same time he observes, Idolatry is attended with this evident advantage, that, by limiting the powers and functions of its Deities, it naturally admits the Gods of other sects and nations to a share of divinity, and renders all the various Deities, as well as rites, ceremonies, or traditions, compatible with each other.

Theism is opposite, both in its advantages and disadvantages, as it supposes one sole Deity, the perfection of reason and goodness, it should, our Author says, if justly prosecuted, banish every thing frivolous, unreasonable, or inhuman, from religious worship, and set before men the most illustrious example, as well as the most commanding motives of justice and benevolence. These mighty advantages are not, indeed, over balanced, (for that is not possible) but somewhat diminished, we are told, by inconveniences, which arise from the vices and prejudices of mankind. While one sole object of devotion is acknowledged, the worship of other Deities is regarded as absurd and impious. Nay, this unity of object seems naturally to require the unity of faith and ceremonies, and furnishes designing men with a pretext for representing their adversaries as prophane, and the objects of divine, as well as human, vengeance. For as each sect is positive, that its own faith and worship are entirely acceptable to the Deity; and as no one can conceive, that the same Being should be pleased with different and opposite rites and principles; the several sects fall naturally into animosity, and mutually discharge on each other, that sacred zeal and rancour, the most furious and implacable of all human passions.

The tolerating spirit of Idolaters, both in antient and modern times, Mr. Hume says, is very obvious to any one, who is the least conversant in the writings of historians, or travellers; and the intolerance of almost all religions, which have maintained the unity of God, is as remarkable as the contrary principle in Polytheists. The implacable narrow spirit of the {127} Jews, we are told, is well known. Mahommedism set out with still more bloody principles, and even to this day deals out damnation, though not fire and faggot, to all other sects. And if, amongst Christians, the English and Dutch have embraced the principles of toleration, this singularity has proceeded from the steady resolution of the civil magistrate, in opposition to the continued efforts of priests and bigots.

"I may venture to affirm," continues our Author, "that few corruptions of Idolatry and Polytheism are more pernicious to political society, than this corruption of Theism, when carried to the utmost height. The human sacrifices of the Carthaginians, Mexicans, and many barbarous nations, scarce exceed the Inquisition, and persecutions of Rome and Madrid. For besides, that the effusion of blood may not be so great in the former case, as in the latter; besides this, I say, the human victims, being chosen by lot, or by some exterior signs, affect not in so considerable a degree, the rest of the society. Whereas virtue, knowledge, lobe of liberty, are the qualities which call down the fatal vengeance of Inquisitors; and when expelled, have the society in the most shameful ignorance, corruption, and bondage. The illegal murder of one man by a tyrant, is more pernicious than the death of a thousand by pestilence, famine, or any undistinguishing calamity."

From the comparison of Theism and Idolatry, our Author proceeds to form some other observations, in order to confirm the vulgar saying, that the corruption of the best things gives rise to the worst. He tells us, that where the Deity is represented as infinitely superior to mankind, this belief, though altogether just, is apt, when joined with superstitious terrors, to sink the human mind into the lowest submission and abasement, and to represent the monkish virtues of mortification, pennance, humility, and passive suffering, as the only qualities which are acceptable to him. But where the Gods are conceived to be only a little superior to mankind, and to have been many of them advanced from that inferior rank, we are more at our ease in our addresses to them; and may even, without profaneness, aspire sometimes to a rivalship, and emulation of them. Hence activity, spirit, courage, magnanimity, love of liberty, and all the virtues which aggrandize a people.

He observes further, to the same purpose, that if we examine, without prejudice, the antient Heathen Mythology as, contained in the Poets, we shall not discover in it any such monstrous absurdity, as we may be apt at first to apprehend. Nay, so natural does Mr. Hume think the whole mythological {128} system, that in the vast variety of planets and worlds contained in the universe, he thinks it more than probable, that, somewhere or other, it is really carried into execution.

"The chief objection to it," says he, "with regard to this planet, is, that it is not ascertained by any just reason or authority. The antient tradition insisted on by the Heathen Priests and Theologers, is but a weak foundation, and transmitted also such a number of contradictory reports, supported, all of them, by equal authority, that it became absolutely impossible to fix a preference among them. A few volumes therefore must contain all the Polemical writings of Pagan Priests, and their whole theology must consist more of traditional stories, and superstitious practices, than of philosophical argument and controversy.

But where Theism forms the fundamental principle of any popular religion, that tenet is so conformable to sound reason, that philosophy is apt to incorporate itself with such a system of theology. And if the other dogmas of that system be contained in a sacred book, such as *the Alcoran*;2 or be determined by any visible authority, like that of the Roman Pontiff; speculative reasoners naturally carry on their assent, and embrace a theory which has been instilled into them by their earliest education, and which also possesses some degree of consistence and uniformity. But as these appearances do often, all of them, prove deceitful, philosophy will soon find herself very unequally yoked with her new associate; and instead of regulating each principle as they advance together, she is at every turn perverted to serve the purposes of superstition: for, besides the unavoidable incoherencies which must be reconciled and adjusted, one may safely affirm, that all popular theology, especially the scholastic, has a kind of appetite for absurdity and contradiction. If the theology went not beyond reason and common sense, her doctrines would

appear too easy and familiar. Amazement must of necessity be raised. Mystery affected, darkness and obscurity sought after; and a foundation of merit afforded the devout votaries who desire an opportunity of subduing their rebellious reason, by the belief of the most unintelligible sophisms.

Ecclesiastical history sufficiently confirms these reflections. When a controversy is started, some people pretend always with certainty, to conjecture the issue. Which ever opinion, says they, is more contrary to plain sense, is sure to prevail; even where the general interest of the system requires not that decision. Though the reproach of heresy {129} may for some time be bandied about amongst the disputants, it always rests on the side of reason. Any one, it is pretended, that has but learning enough to know the definition of *Arian, Pelagian, Erastian, Socinian, Sabellian, Eutychian, Nestorian, Monothelite, &c.* not to mention *Protestant*, whose fate is yet uncertain, will be convinced of the truth of this observation. And thus a system becomes more absurd in the end, merely from its being reasonable and philosophical in the beginning.

To oppose the torrent of scholastic religion, by such feeble maxims as these, that *it is impossible for the same thing to be and not to be*, that *the whole is greater than a part*; that *two and three make five*; is pretending to stop the ocean with a bull-rush. Will you set up profane reason against sacred mystery? No punishment is great enough for your impiety. And the same fires which were kindled for heretics, will serve also for the destruction of philosophers."

After several other reflections on this subject, Mr. Hume goes on to observe, that notwithstanding the dogmatical imperial style of all superstition, the conviction of the religionists, in all ages, is more affected than real, and scarce approaches in any degree, to that solid belief and persuasion which governs us in the common affairs of life. Men dare not avow, even to their own hearts, the doubts, which they entertain on such subjects; they make a merit of implicit faith, and disguise to themselves their real infidelity, by the strongest asseverations, and most positive bigotry. But nature is too hard for all their endeavours, and suffers not the obscure, glimmering light, afforded in those shadowy regions, to equal the strong impressions made by common sense, and by experience. The usual course of men's conduct belies their words, and shews, that the assent in these matters is some unaccountable operation of the mind, betwixt disbelief and conviction, but approaching much nearer to the former than the latter.

> "Since therefore," continues Mr. Hume, "the mind of man appears of so loose and unsteady a contexture, that even at present, when so many persons find an interest in continually employing on it the chissel and the hammer, yet are they not able to engrave theological tenets with any lasting impression; how much more must this have been the case in antient times, when the retainers to the holy function were so much fewer in comparison? No wonder that the appearances, were then very inconsistent, and that men, on some occasions, might seem determined infidels, and enemies to {130} the established religion, without being so in reality; or at least without knowing their minds in that particular."

In the further prosecution of this subject, our Author observes, that in every religion, however sublime the verbal definition which it gives of its divinity, many of the votaries, perhaps the greatest number, will still seek the divine favour, not by virtue and good morals, which alone can be acceptable to a perfect Being, but either by frivolous observances, by intemperate zeal, by rapturous extasies, or by the belief of mysterious and absurd opinions. Nay, if we should suppose, he says, what seldom happens, that a popular religion were found, in which it was expressly declared, that nothing but morality could gain the Divine favour; if an order of Priests were

instituted to inculcate this opinion, in daily sermons, and with all the arts of persuasion; yet so inveterate are the people's prejudices, that for want of some other superstition, they would make the very attendance on these sermons the essentials of religion, rather than place them in virtue and good morals. The manner in which he accounts for this, is as follows:

The duties, he says, which a man performs as a friend or parent, seem merely owing to his benefactor, or children; nor can he be wanting these duties, without breaking through all the ties of nature and morality. A strong inclination may prompt him to the performance: a sentiment of order and moral beauty joins its force to these natural ties; and the whole man, if truly virtuous, is drawn to his duty without any effort or endeavour. Even with regard to the virtues which are more austere, and more founded on reflection, such as public spirit, filial duty, temperance, or integrity; the moral obligation, in our apprehension, removes all pretence to religious merit; and the virtuous conduct is esteemed no more than what we owe to society, and to ourselves. In all this a superstitious man finds nothing which he has properly performed for the sake of his Deity, or which can peculiarly recommend him to the divine favour and protection. He considers not, that the most genuine method of serving the Divinity, is by promoting the happiness of his creatures. He still looks out for some more immediate service of the Supreme Being, in order to allay those terrors with which he is haunted. And any practice recommended to him, which either serves to no purpose in life, or offers the strongest violence to his natural inclinations; that practice he will more readily embrace, on account of those very circumstances, which should make him absolutely reject it. It seems the more purely religious, that it proceeds from no mixture of any other motive {131} or consideration. And if, for its sake, he sacrifices much of his ease and quiet, his claim of merit appears still to rise upon him, in proportion to the zeal and devotion which he discovers. In restoring a loan, of paying a debt, is Divinity is no way beholden to him; because these acts of justice are what he was bound to perform, and what many would have performed, were there not God in the universe. But if he fast a day, or give himself a sound whipping, this has a direct reference, in his opinion, to the service of God. No other motive could engage him to such austerities. By these distinguished marks of devotion, he has now acquired the Divine favour; and may expect, in recompence, protection and safety in this world, and eternal happiness in the next.

Mr. Hume concludes this long Dissertation, which takes up near half the volume, in the following manner.

> **"Though the stupidity of men, barbarous and uninstructed, be so great," says he, "that they may not see a sovereign Author in the more obvious works of nature, to which they are so much familiarized; yet it scarce seems possible, that any one of good understanding should reject that idea, when once it is suggested to him. A purpose, an intention, a design, is evident in every thing; and when our comprehension is so far enlarged, as to contemplate the first rise of this visible system, we must adopt, with the strongest conviction, the idea of some intelligent cause or author. The uniform maxims too, which prevail through the whole frame of the universe, naturally, if not necessarily, lead us to conceive this intelligence as single and undivided, where the prejudices of education oppose not so reasonable a theory. Even the contrarities of nature, by discovering themselves every where, become proofs of some consistent plan, and establish one single purpose or intention, however inexplicable and incomprehensible.**

Good and ill are universally intermingled and confounded; happiness and misery, wisdom and folly, virtue and vice. Nothing is pure, and entirely of a piece. All advantages are attended with

disadvantages. an universal compensation prevails in all conditions of Being and Existence. And it is scarce possible for us, by our most chimerical wishes, to form the idea of a station or situation altogether desirable. The draughts of life, according to the Poet's fiction, are always mixed from the vessels on each hand of Jupiter. Or if any cup be presented altogether pure, it is drawn only, as the same Poet tells us, from the left-hand vessel. {132}

The more exquisite any good is, of which a small specimen is afforded us, the sharper is the evil allied to it; and few exceptions are found to this uniform law of nature. The most sprightly wit borders on madness; the highest effusions of joy produce the deepest melancholy; the most ravishing pleasures are attended with the most cruel lassitude and disgust; the most flattering hopes make way for the severest disappointments. And, in general, no course of life has such safety (for happiness is not to be dreamed of) as the temperate and moderate, which maintains, as far as possible, a mediocrity, and a kind of insensibility, in every thing.

As the good, the great, the sublime, the ravishing, are found eminently in the genuine principles of Theism, it may be expected, from the analogy of nature, that the base, the absurd, the mean, the terrifying, will be discovered equally in religious fictions and chimeras.

The universal propensity to believe in invisible, intelligent power, if not an original instinct, being at least a general attendant of human nature, it may be considered as a kind of mark or stamp, which the Divine Workman has set upon his work; and nothing, surely, can more dignify mankind, than to be thus selected from all the other parts of the creation, and to bear the image or impression of the universal Creator. But consult this image, as it commonly appears in the popular religions of the world, how is the Deity disfigured in our representations of him!. What caprice, absurdity, and immorality are attributed to him! How much is he degraded, even below the character which we should naturally, in common life, ascribe to a man of sense and virtue!

What a noble privilege is it of human reason, to attain the knowledge of the Supreme Being; and, from the visible works of nature, be enabled to infer so sublime a principle as its supreme Creator? But turn the reverse of the medal, survey most nations and most ages. Examine the religious principles, which have in fact prevailed in the world; you will scarcely be persuaded, that they are other than sick mens dreams: or perhaps will regard them more as the playsome whimsies of monkeys in human shape, than the serious, positive, dogmatical observations of a Being, who dignifies himself with the name of rationals.

Here the verbal protestations of all men: nothing they are so certain of as their religious tenets. Examine their lives, you will scarcely think they repose the smallest confidence in them. {133}

The greatest and truest zeal gives us no security against hypocrisy: the most open impiety is attended with a secret dread and compunction.

No theological absurdities so glaring, as have not, sometimes, been embraced by men of the greatest and most cultivated understanding. No religious precepts so rigorous, as have not been adopted by the most voluptuous and most abandoned of men.

Ignorance *is the mother of devotion*. A maxim that is proverbial, and confirmed by general experience. Look out for a people entirely devoid of religion: if you find them at all, be assured that they are but a few degrees removed from brutes.

What so pure as some of the morals included in some theological systems? What so corrupted, as some of the practices to which these systems give rise?

The comfortable views exhibited by the belief of a futurity, are ravishing and delightful: but how

quickly vanish on the appearance of its terrors, which keep a more firm and durable possession of the human mind?

The whole is a riddle, an aenigma, an inexplicable mystery. Doubt, uncertainty, suspence of judgment, appear the only result of our most accurate scrutiny, concerning this subject. But such is the frailty of human reason, and such the irresistable contagion of opinion, that even this deliberate doubt could scarce be upheld, did we not enlarge our view, and opposing one species of superstition to another, set them a quarrelling, while we ourselves, during their fury and contention, happily make our escape into the calm, though obscure, regions of philosophy."

Thus have we given a pretty full view of what is contained in Mr. Hume's first Dissertation; which abounds with shrewd reflections, and just observations, upon human nature: mixed with a considerable portion of that sceptical spirit, which is so apparent in all his works; and some insinuations, artfully couched, against the Christian religion. We shall content ourselves with a general view of the other three Dissertations, that we may not stretch this article beyond its just bounds.

Mr. Hume's design in the second Dissertation is to shew, that, in the production and conduct of the passions, there is a certain regular mechanism, which is susceptible of as accurate a disquisition, as the laws of motion, optics, hydrostatics, or any part of natural philosophy. His theory of the passions depends entirely on the double relations of sentiments and {134} ideas and the mutual assistance which these relations lend to each other. What he says upon the subject, is extremely ingenious, and deserves the philosophical reader's attentive perusal.

The third Dissertation is a very short one, consisting only of sixteen pages. The design of it is to account for the pleasure which the spectators of a well-wrote tragedy receive, from sorrow, terror, anxiety, and other passions, which are in themselves disagreeable and uneasy. Fontenelle's account of this phaenomenon, (*Reflections sur la Poetique*, sect. 36) Mr. Hume thinks just and convincing; though it still wants, he imagines, some new addition, in order to make it answer fully. He observes, that the force of imagination, the energy of expression, the power of numbers, the charms of imitation, are all naturally, of themselves, delightful to the mind; and that when the object presented lays also hold of some affection, the pleasure still rises upon us, by the conversion of this subordinate movement, into that which is predominant. The passion, though, perhaps, naturally, and when excited by the simple appearance of a real object, it may be painful; is yet so smoothed, and softened, and mollified, when raised by the finer arts, that it affords the highest entertainment. To confirm this reasoning, our Author observes, that if the movements of the imagination be not predominant above those of the passion, a contrary effect follows; and the former, being now subordinate, is converted into the latter, and still farther increases the pain and affliction of the sufferer.

"An action," says he, "represented in tragedy, may be too bloody, and attrocious. It may excite such movements of horror, as will not soften into pleasure; and the greatest energy of expression bestowed on descriptions of that nature, serves only to augment our uneasiness. Such is that action represented in *The Ambitious Step-mother*, where a venerable old man, raised to the heighth of fury and despair, rushes against a pillar, and striking his head upon it, besmears it all over with mingled brains and gore. The *English* theatre abounds too much with such images."

In the fourth Dissertation, Mr. Hume endeavours to fix *a standard of Taste*; a rule by which the various sentiments of men may be reconciled; or, at least, a decision afforded, confirming one sentiment, and condemning another. In treating this curious and much controverted subject, he

observes, that none of the rules of composition are fixed by reasoning *a priori,* or can be esteemed abstract conclusions of the understanding, from comparing those habitudes and relations of ideas, which are eternal {135} and immutable. Their foundation, he says, is the same with that of all the practical sciences, experience; nor are they any thing, but general observations, concerning what has been universally found to please, in all countries, and in all ages. But though all the general rules of art are founded only on experience, and on the observation of the common sentiments of human nature, the feelings of men, we are told, will not, on every occasion, be conformable to these rules. Those finer emotions of the mind are of a very tender and delicate nature, and require the concurrence of many favourable circumstances, to make them play with facility and exactness, according to their general and established principles. The least exterior hindrance to such small springs, or the least internal disorder, disturbs their motion, and confounds the operation of the whole machine. When we would make an experiment of this nature, and would try the force of any beauty or deformity, we must chuse with care a proper time and place, and bring the fancy to a suitable situation and disposition. A perfect serenity of mind, a recollection of thought, a due attention to the object; if any of these circumstances be wanting, our experiment will be fallacious, and we shall be unable to judge of the catholic and universal beauty. The relation which nature has placed betwixt the form and the sentiment, will at least be more obscure; and it will require greater accuracy to tract or discern it. We shall be able to ascertain its influence not so much from the operation of each particular beauty, as from the durable admiration which attends those works, that hath survived all the caprices of mode and fashion, all the mistakes of ignorance and envy.

Amidst all the variety and caprices of taste, Mr. Hume observes, that there are certain general principles of approbation or blame, whose influence a careful eye may trace in all operations of the mind. Some particular forms or qualities, from the original structure of the internal fabric, are calculated to please, and others to displease; and if they fail of their effect in any particular instance, it is from some apparent defect or imperfection in the organ. A man in a fever would not insist on his palate as able to decide concerning flavours; nor would one affected with the jaundice, pretend to give a verdict with regard to colours. In each creature, we are told, there is a sound and a defective state; and the former alone can be supposed to afford us a true standard of taste and sentiment. If in the sound state of the organs, there be an entire, or a considerable uniformity of sentiment among men, we may thence derive an idea of the perfect and universal beauty; in like {136} manner as the appearance of the objects in day-light to the eye of a man in health, is denominated their true and real colour, even while colour is allowed to be merely a phantasm of the senses.

There are many and frequent defects, our Author tells us, in the internal organs, which prevent, or weaken the influence of those general principles, on which depends our sentiment of beauty or deformity. And one obvious cause, why many feel not the proper sentiment of beauty, is the want of that *delicacy* of imagination, which every one talks of, and every one pretends to. Now as Mr. Hume's design in this dissertation, is to mingle some light of the understanding with the feelings of sentiment, he endeavours to give a more accurate definition of delicacy, than has hitherto been attempted.

"Though it be certain," says he, "that beauty and deformity, no more than sweet and bitter, are not qualities in objects, but belong entirely to the sentiment, internal or external; it must be allowed, that there are certain qualities in objects, which are fitted by nature to produce those particular feelings. Now as these qualities may be found in a small degree, or may be mixed and confounded with each other, it often happens, that the taste is not affected with such minute

qualities, or is not able to distinguish all the particular flavours, amidst the disorder in which they are presented. Where the organs are so fine, as to allow nothing to escape them; and at the same time so exact as to perceive every ingredient in the composition: this we call delicacy of taste, whether we employ these terms i the natural or metaphorical sense. Here then the general rules of beauty are of use; being drawn from established models, and from the observation of what pleases or displeases, when presented singly and in a high degree: and if the same qualities, in a continued composition, and a smaller degree, affect not the organs with a sensible delight or uneasiness, we exclude the person from all pretensions to this delicacy.

It is acknowledged to be the perfection of every sense or faculty, to perceive with exactness its most minute objects, and allow nothing to escape its notice and observation. The smaller the objects are which become sensible to the eye, the finer is that organ, and the more elaborate its make and composition. A good palate is not tired by strong flavours; but by a mixture of small ingredients, where we are still sensible of each part, notwithstanding its minuteness and its confusion with the rest. In like manner, a quick and acute perception of beauty and deformity must be the perfection of {137} our mental taste, nor can a man be satisfied with himself while he suspects, that any excellence, or blemish, in a discourse, has passed him unobserved. In this case, the perfection of the man, and the perfection of the sense, or feeling, are found to be united. A very delicate palate, on many occasions, may be a great inconvenience, both to a man himself, and to his friends; but a delicate taste of wit or beauty, must always be a desirable quality, because it is the source of all the finest and most innocent enjoyments, of which human nature is susceptible. In this decision, the sentiments of all mankind are agreed. Wherever you can fix or ascertain a delicacy of taste, it is sure to be approved of; and the best way of fixing it, is to appeal to those models and principles which have been established by the uniform approbation and experience of nations and ages."

Mr. Hume goes on to observe, that nothing tends further to increase and improve this delicacy of taste, than practice in a particular art, and the frequent survey or contemplation of a particular species of beauty. When objects of any kind, are first presented to the eye, or imagination, the sentiment, he says, which attends them, is obscured and Confused: and the mind is, in a great measure, incapable of pronouncing concerning their merits or defects. The taste cannot perceive the several excellencies of the performance, much less distinguish the particular character of each excellency, and ascertain its quality and degree. If it pronounce the whole in general to be beautiful or deformed, it is the utmost which can be expected; and even this judgment, a person so unpractised will be apt to deliver with great hesitation and reserve. But allow him to acquire experience in those objects, his feeling becomes more exact and nice: he not only perceives the beauties and defects of each part, but marks the distinguishing species of each quality, and assigns it suitable praise or blame. A clear and distinct sentiment attends him through the whole survey of the objects, and he discerns that very degree and kind of approbation, or displeasure, which each part is naturally fitted to produce.

It is impossible, Mr. Hume observes, further, to continue in the practice of contemplating any order of beauty, without being frequently obliged to form *comparisons* between the several species and degrees of excellency, and estimating their proportion to each other. A man, he says, who has had no opportunity of comparing the different kinds of beauty, is totally unqualified to pronounce an opinion, with regard to any object presented to him; and he alone who has had {138} opportunities of seeing, and examining and weighing the several performances, admired in different ages and nations, is capable of rating the merits of a work exhibited to his view, and

assigning its proper rank among the productions of genius. But to enable him the better to perform this, he must preserve his mind free, we are told, from all prejudice, and allow nothing to enter into his consideration, but the very object which is submitted to his examination.

"When any work is addressed to the Public," says Mr. Hume, "though I should have a friendship or enmity with the Author, I must depart from this particular situation; and considering myself as a man in general, forget, if possible, any individual Being, and my peculiar circumstances. A person influenced by prejudice, complies not with this condition; but obstinately maintains his natural position, without entering into that required by the performance. If the work be addressed to persons of a different age or nation, he makes no allowance for their peculiar views and prejudices; but, full of the manners of his won times, rashly condemns what seemed admirable in the eyes of those for whom alone the discourse was calculated. If the work be executed for the Public, he never sufficiently enlarges his comprehension, or forgets his interests as a friend or enemy, as a rival or commentator. By this means his sentiments are perverted; nor have the same beauties and blemishes the same influence upon him, as if he had imposed a proper violence on his imagination, and had forgot himself for a moment. So far his taste evidently departs from the true standard, and of consequence loses all credit and authority."

As in all questions submitted to the understanding, prejudice is destructive of sound judgment, and perverts all operations of the intellectual faculties, it is no less contrary, Mr. Hume observes, to good taste; nor has it less influence to corrupt our sentiments of beauty. It belongs to *good sense*, he says, to check its influence in both cases; and in this respect, as well as in many others, reason, if not an essential part of taste, is at least requisite to the operations of it.

Thus, we are told, though the principles of taste be universal, and nearly, if not entirely, the same in all men; yet few are qualified to give judgment on any work of art, or establish their own sentiment as the standard of beauty. When the critic has no delicacy, he judges without any distinction, and is only affected by the grosser and more palbable qualities of the object: the finer touches pass unnoticed and disregarded. Where he is not aided by practice, his verdict is {139} attended with confusion and hesitation. Where no comparison has been employed, the most frivolous beauties, such as rather merit the name of defects, are the objects of his admiration. Where he lies under the influence of prejudice, all his natural sentiments are perverted. Where good sense is wanting, he is not qualified to discern the beauties of design and reasoning, which are the highest and most excellent. Under some or other of these imperfections, the generality of men labour; and hence a true judge in the finer arts is observed, even during the most polished ages, to be so rare a character: strong sense united to delicate sentiment, improved by practice, perfected by comparison, and cleared of all prejudice, can alone entitle critics to this valuable character; and the joint verdict of such, wherever they are to be found, is the true standard of taste and beauty.

But notwithstanding our Author's endeavours to fix a standard of taste, and reconcile the various apprehensions of men, there still remain two sources of variation; which, though they be not sufficient to confound all the boundaries of beauty and deformity, will often serve, he says, to vary the degrees of our approbation or blame. The one is the different humours of particular men; the other, the particular manners and opinions of our age and country. The general principles of taste are uniform in human nature: where men vary in their judgments, some defect or perverseness in the faculties may commonly be remarked; proceeding either from prejudice, from want of practice, or want of delicacy; and there is just reason for approving one taste, and condemning another. But where there is such a diversity in the internal frame, or external situation, as is entirely blameless on both sides, and leaves no room to give one the preference above the other, in

that case, a certain diversity of judgment is unavoidable, and we seek in vain for a standard, by which we can reconcile the contrary sentiments.

There are many other pertinent reflections, and pretty illustrations, in this ingenious Dissertation, besides those we have mentioned; but we must refer to curious Reader, who is desirous of further satisfaction, to the work itself.

{343}

ART. VII. *Dialogues concerning Natural Religion*. By David Hume, Esq; 8vo. 4 s. Sewed. Robinson. 1779.

WE Have here a very elaborate performance. It treats on the most important and interesting subject that can possibly employ the thoughts of a reasonable being. It is written with great elegance; in the true spirit of ancient dialogue; and, in point of composition, is equal, if not superior, to any of Mr. Hume's other writings. Nothing new, however, is advanced on the subject. The author, indeed, has attempted little more than to throw the most exceptionable parts of his philosophical works into a new form, and to present them in a different dress.

The conversation is supported by CLEANTHES, DEMEA, and PHILO. -- Cleanthes, to use Mr. Hume's own words, is a person of an accurate philosophical turn; Philo, a careless sceptic; and Demea, a rigid, inflexible, orthodox divine. Cleanthes, however, defends a good cause very feebly, and is by no means entitled to the character of an accurate philosopher. Demea supports the character of a sour, croaking divine, very tolerably; but PHILO is the hero of the piece; and it must be acknowledged, that he urges his objections with no inconsiderable degree of acuteness and subtlety.

We shall endeavour to give our Readers a concise, but clear view, of what is advanced by each of the speakers; and, not to weaken the force of their arguments, we shall give their own words.

"No man; no man, at least," says Demea, "of common sense, I am persuaded, ever entertained a serious doubt of the being of a God. The question is not concerning the BEING, but the NATURE of GOD. This I affirm, from the infirmities of human understanding, to be altogether incomprehensible and unknown to us. The essence of that supreme mind, his attributes, the manner of his {344} existence, the very nature of his duration; these, and every particular, which regards so divine a Being, are mysterious to men. Finite, weak, and blind creatures, we ought to humble ourselves in his august presence, and, conscious of our frailties, adore in silence his infinite perfections, which eye hath not seen, ear hath not heard, neither hath it entered into the heart of man to conceive. They are covered in a deep cloud from human curiosity: it is profaneness to attempt penetrating through these sacred obscurities; and next to the impiety of denying his existence, is the temerity of prying into his nature and essence, decrees and attributes. --

"The ancient Platonists were the most religious and devout of all the Pagan philosophers: yet many of them, particularly Plotinus, expressly declare, that intellect or understanding is not to be ascribed to the Deity, and that our most perfect worship of him consists, not in acts of veneration, reverence, gratitude, or love; but in a certain mysterious self-annihilation, or total extinction of all our faculties. These ideas are, perhaps, too far stretched; but still it must be acknowledged, that, by representing the Deity as comprehensible, and similar to a human mind, we are guilty of the grossest and most narrow partiality, and make ourselves the model of the whole universe --

"It is my opinion, that each man feels, in a manner, the truth of religion within his own breast; and from a consciousness of his imbecility and misery, rather than from any reasoning, it led to seek protection from that Being, on whom he and all nature is dependent. So anxious, or so tedious, are even the best scenes of life, that futurity is still the object of all our hopes and fears. We incessantly look forward, and endeavour, by prayers, adoration, and sacrifice, to appease those unknown powers, whom we find, by experience, so able to afflict and oppress us. Wretched creatures that we are! what resource for us amidst the innumerable ills of life, did not religion suggest some methods of atonement, and appease those terrors, with which we are incessantly agitated and tormented? -- The miseries of life, the unhappiness of man, the general corruptions of our nature, the unsatisfactory enjoyment of pleasures, riches, honours; these phrases have become almost proverbial in all languages. And who can doubt of what all men declare from their own immediate feeling and experience? -- Look round this library of Cleanthes. I *shall* venture to affirm, that, except Authors of particular sciences, such as chymistry or botany, who have no occasion to treat of human life, there is scarce one of those innumerable writers, from whom the sense of human misery has not, in some passage or other, extorted a complaint and confession of it. At least, the chance is entirely on that side; and no one Author has ever, so far as I can recollect, been so extravagant as to deny it. -- The whole earth, believe me, Philo, is cursed and polluted. A perpetual war is kindled among all living creatures. Necessity, hunger, want, stimulate the strong and

courageous; fear, anxiety, terror, agitate the weak and infirm. The first entrance into life gives anguish to the new born infant and to its wretched parent: weakness, impotence, distress, attend each stage of that life: and 'tis at last finished in agony and horror. -- Though the external insults from animals, from {345} men, from all the elements, which assault us, form a frightful catalogue of woes, they are nothing in comparison of those, which arise within ourselves, from the distempered condition of our minds and body. How many lie under the lingering torment of diseases? And the disorders of the mind, though more secret, are not perhaps less dismal and vexatious. Remorse, shame, anguish, rage, disappointment, anxiety, fear, dejection, despair; who has ever passed through life without cruel inroads from these tormentors? How many have scarcely ever felt any better sensations? Labour and poverty, so abhorred by every one, are the certain lot of the far greater number: and those few privileged persons, who enjoy ease and opulence, never reach contentment or true felicity. All the goods of life united would not make a very happy man: but all the ills united would make a wretch indeed; and any one of them almost (and who can be free from every one?) nay often the absence of one good (and who can possess all?) is sufficient to render life ineligible. --

"Nothing can be more surprising than to find a topic like this, concerning the wickedness and misery of man, charged with no less than atheism and profaneness. Have not all pious divines and preachers, who have indulged their rhetoric on so fertile a subject; have they not easily, I say, given solution of any difficulties which may attend it? This world is but a point in comparison of the universe: this life but a moment in comparison to eternity. The present evil phenomena, therefore, are rectified in other regions, and in some future period of existence. And the eyes of men, being then opened to larger views of things, see the whole connection of general laws, and trace, with adoration, the benevolence and rectitude of the Deity, through all the mazes and intricacies of his providence."

Such are the sentiments of the rigid, inflexible, orthodox DEMEA; such are the arguments which he employs to prove the mysterious, incomprehensible nature of the Deity, and by which he endeavours to shew, that the infirmities of our nature do not permit us to attain any ideas, which in the least correspond to the ineffable sublimity of the divine attributes. Let us now hear what the 'accurate' philosopher CLEANTHES says.

Demea asserts, as we have already mentioned, that the present evil phenomena are rectified in some future period of existence --

> **"No! replied Cleanthes, No! These arbitrary suppositions can never be admitted, contrary to matter of fact, visible and uncontroverted. Whence can any cause be known but from its known effects? Whence can any hypothesis be proved but from the apparent phenomena? To establish one hypothesis upon another is building entirely in the air; and the utmost we ever attain, by these conjectures and fictions, is to ascertain the bare possibility of our opinion; but never can we, upon such terms, establish its reality.**

"The only method of supporting divine benevolence (and it is what I willingly embrace), is to deny absolutely the misery and wickedness of man. Your representations are exaggerated: your melancholy views mostly fictitious: your inferences contrary to fact and experience. Health is more common than Sickness; pleasure than pain; happiness than misery. And for one vexation, which {346} we meet with, we attain, upon computation, a hundred enjoyments. --

"I have been apt to suspect," says this *accurate philosopher*, "the frequent repetition of the

word *finite*, which we meet with in all theological writers, to favour more of panegyric than of philosophy, and that any purposes of reasoning, and even of religion, would be better served, were we to rest contented with more accurate and more moderate expressions. The terms, *admirable, excellent, superlatively, great, wise, and holy*; these sufficiently fill the imaginations of men; and any thing beyond, besides that it leads into absurdities, has no influence on the affections or sentiments. Thus, in the present subject, if we abandon all human analogy, as seems your intention, Demea, I am afraid we abandon all religion, and retain no conception of the great object of our adoration. If we preserve human analogy, we must for ever find it impossible to reconcile any mixture of evil in the universe with infinite attributes; much less, can we ever prove the latter from the former. But supposing the Author of Nature to be finitely perfect," (a strange supposition, surely!) "though far exceeding mankind; a satisfactory account may then be given of natural and moral evil, and every untoward phenomenon be explained and adjusted. A less evil may then be chose, in order to avoid a greater; inconveniences be submitted to, in order to reach a desirable end; and, in a word, benevolence, regulated by wisdom, and limited by necessity may produce just such a world as the present."

The principal points which Cleanthes endeavours to establish are, -- that the works of nature are similar to those of art; that the Deity is similar to a human mind and understanding, and that our ideas of his attributes, as far as they go, are just and adequate, and correspondent to his real nature.

"Look round the world, says he, contemplate the whole and every part of it; you will find it to be nothing but one great machine, subdivided into an infinite number of lesser machines, which again admit of subdivisions, to a degree beyond what human senses and faculties can trace and explain. All these various machines, and even their most minute parts are adjusted to each other with an accuracy, which ravishes into admiration all men, who have ever contemplated them. The curious adapting of means to ends, throughout all nature, resembles exactly, though it much exceeds, the productions of human contrivance, of human design, thought, wisdom, and intelligence. Since therefore the effects resemble each other, we are led to infer, by all the rules of analogy, that the causes also resemble; and that the Author of Nature is somewhat similar to the mind of man; though possessed of much larger faculties, proportioned to the grandeur of the work, which he has executed. By this argument *a posteriori*, and by this argument alone, do we prove at once the existence of a Deity, and his similarity to human mind and intelligence."

In regard to the argument *a priori*, as it is called, Cleanthes endeavours to shew its fallacy, and that it is of very little consequence to the cause of true piety or religion. {347}

"I shall begin, says he, with observing, that there is an evident absurdity in pretending to demonstrate a matter of fact, or to prove it by any argument *a priori*. Nothing is demonstrable, unless the contrary implies a contradiction. Nothing, that is distinctly conceivable, implies a contradiction. Whatever we conceive as existent, we can also conceive as non-existent. There is no being, therefore, whose non-existence implies a contradiction. Consequently there is no being, whose existence is demonstrable. I propose this argument as entirely decisive, and am willing to rest the whole controversy upon it."

Cleanthes, our Readers have already seen, is of opinion that the ascribing of *infinite* perfections to the Deity leads into absurdities, and has no influence on the affections or sentiments; and that, if we suppose the Author of Nature to be *finitely* perfect, we may give a satisfactory account of natural and moral evil, explain and adjust every untoward phenomenon.

Now, if the Author of Nature be *finitely* perfect, his perfections are limited, or, in other words, he is an imperfect Being; and yet Cleanthes, in another passage, says that he is a Being perfectly good, wise, and powerful.

"The most agreeable reflection, says he, which it is possible for human imagination to suggest, is that of genuine Theism, which represents us as the workmanship of a Being perfectly good, wise, and powerful; who created us for happiness, and who, having implanted in us immeasurable desires of good, will prolong our existence to all eternity, and will transfer us into an infinite variety of scenes in order to satisfy those desires, and render our felicity complete and durable. Next to such a Being himself (if the comparison be allowed) the happiest lot which we can imagine, is that of being under his guardianship and protection." -- O SI SIC OMNIA!

It is not our business to answer Mr. Hume, but it is obvious to remark, that a Being *finitely* perfect, cannot be *perfectly* wise and good. The character of Cleanthes, therefore, is not consistent; nor is it properly supported; for an accurate philosopher should have shewn, clearly and distinctly, upon philosophical principles, by what steps he rose to the idea of a perfectly wise and good Being, and what reasons he had for concluding that this Being would prolong our existence to all eternity, and make us completely happy.

But we now proceed to lay before our Readers Mr. Hume's own sentiments in the character of the 'careless sceptic,' PHILO. -- He acknowledges that a purpose, an intention, a design, strikes every where the most stupid thinker, the most careless observer of nature, that no man can be so hardened in absurd systems, as at all times to reject it; that in many views of the universe, and of its parts, particularly the latter, the beauty and fitness of final causes strike us with such irresistible force, that all objections appear (what he believes they really are) {348} mere cavils and sophisms; and that we cannot then imagine how it was ever possible for us to lay any stress on them. But there is no view of human life, he tells us, from which, without the greatest violence, we can infer the moral attributes, or learn infinite benevolence, conjoined with infinite power and infinite wisdom, which we must discover by the eyes of faith alone. He thinks it extremely unreasonable to form our ideas of the Author of Nature from our experience of the narrow productions of human design and invention, and says that it is impossible for us to tell, from our limited views, whether the present system of things deserves any considerable praise, if compared to other possible, and even real systems.

"Could a peasant, says he, if the AENID were read to him, pronounce that poem to be absolutely faultless, or even assign to it its proper rank among the productions of human wit, he, who had never seen any other production?

"But were this world ever so perfect a production, it must still remain uncertain, whether all the excellencies of the work can justly be ascribed to the workman. If we survey a ship, what an exalted idea must we form of the ingenuity of the carpenter, who framed so complicated, useful, and beautiful a machine! And what surprize must we feel, when we find him a stupid mechanic, who imitated others, and copied an art, which, through a long succession of ages, after multiplied trails, mistakes, corrections, deliberations, and controversies, had been gradually improving! Many worlds might have been botched and bungled, throughout an eternity, ere this system was struck out: much labour lost: many fruitless trials made: and a flow, but continued improvement carried on during infinite ages in the art of world making. In such subjects, who can determine, where the truth, nay, who can conjecture where the probability, lies, amidst a great number of hypotheses which may be proposed, and a still greater number, which may be imagined? --

"In a word, CLEANTHES, a man, who follows your hypothesis, is able, perhaps, to assert, or conjecture, that the universe, sometime, arose from something like design: but beyond that position he cannot ascertain one single circumstance, and is left afterwards to fix every point of his theology, by the utmost licence of fancy and hypothesis. This world, for aught he knows, is very faulty and imperfect, compared to a superior standard; and was only the first rude essay of some infant Deity, who afterwards abandoned it, ashamed of his lame performance: it is the work only of some dependent, inferior Deity; and is the object of derision to his superiors: it is the production of old age and dotage in some superannuated Deity; and ever since his death, has run on at adventure, from the first impulse and active force, which it received from him. You justly give signs o horror, DEMEA, at these strange suppositions: but these, and a thousand more of the same kind, are CLEANTHES'S suppositions, not mine. --

There occurs to me another hypothesis, which must acquire an air of probability from the method of reasoning so much insisted on {349} by CLEANTHES. That like effects arise from like causes: this principle he supposes the foundation of all religion. But there is another principle of the same kind, no less certain, and derived from the same source of experience; that where several known circumstances are observed to be similar, the unknown will also be found similar. Thus, if we see the limbs of a human body, we conclude, that it is also attended with a human head, though hid from us. Thus, if we see, through a chink in a wall, a small part of the sun, we conclude, that were the wall removed, we should see the whole body. In short, this method of reasoning is so obvious and familiar, that no scruple can ever be made with regard to its solidity.

Now if we survey the universe, so far as it falls under our knowledge, it bears a great resemblance to an animal or organized body, and seems actuated with a like principle of life and motion. A continual circulation of matter in it produces no disorder; a continual waste in every part is incessantly repaired: the closest sympathy is perceived throughout the entire system; and each part or member, in performing its proper offices, operates both to its own preservation and to that of the whole. The world then, I infer, is an animal, and the Deity is the SOUL of the world, actuating it, and actuated by it. --

Were I obliged to defend any particular system (which I never willingly should do), I esteem none more plausible, than that which ascribes an eternal, inherent principle of order to the world; though attended with great and continual revolutions and alterations. This at once solves all difficulties; and if the solution, by being so general, is not entirely complete and satisfactory, it is, at least, a theory, that we must, sooner or later, have recourse to, whatever system we embrace. --

"Our friend CLEANTHES asserts, that since no question of fact can be proved otherwise than by experience, the existence of a Deity admits not of proof from any other medium. The world, says he, resembles the works of human contrivance: therefore its cause must also resemble that of the other. Here we may remark, that the operation of one very small part of nature, to wit man, upon another very small part, to wit, that inanimate matter lying within his reach, is the rule, by which CLEANTHES judges of the origin of the whole; and he measures objects, so widely disproportioned, by the same individual standard. But to wave all objections drawn from this topic; I affirm that there are other parts of the universe (besides the machines of human invention) which bear still a greater resemblance to the fabric of the world, and which therefore afford a better conjecture concerning the universal origin of this system. These parts are animals and vegetables. The world plainly resembles more an animal or a vegetable, than it does a watch or a knitting loom. Its cause, therefore, it is more probable, resembles the cause of the former. The cause of the former is generation or vegetation. The cause, therefore, of the world, we may infer to be something similar

or analogous to generation or vegetation.

"But how is it conceivable, said DEMEA, that the world can arise from any thing similar to vegetation or generation? Very easily, replied {350} PHILO. In like manner as a tree sheds its seed into the neighbouring fields, and produces other trees; so the great vegetable, the world, or this planetary system, produces within itself certain seeds, which, being scattered into the surrounding chaos, vegetate into new worlds. A comet, for instance, is the seed of a world; and after it has been fully ripened, by passing from sun to sun, and star to star, it is at last tost into the unformed elements, which every where surround this universe, and immediately sprouts up into a new system. --

"I have all along asserted, and still assert, that we have no *data* to establish any system of cosmogony. Our experience, so imperfect in itself and so limited both in extend and duration, can afford no probable conjecture concerning the whole of things. But if we must needs fix on some hypothesis; by what rule, pray, ought we to determine our choice? Is there any other rule than the greater similarity of the objects compared? And does not a plant or animal, which springs from vegetation or generation, bear a stronger resemblance to the world, than does any artificial machine, which arises from reason and design? --

"In this little corner of the world alone, there are four principles, *Reason, Instinct, Generation, Vegetation,* which are similar to each other, and are the causes of similar effects. What a number of other principles may we naturally suppose in the immense extent and variety of the universe, could we travel from planet to planet, and from system to system, in order to examine each part of this mighty fabric? Any one of these four principles above mentioned (and a hundred others which lie open to our conjecture) may afford us a theory, by which to judge of the order of the world; and it is a palpable and egregious partiality, to confine our view entirely to that principle, by which our own minds operate. Were this principle more intelligible on that account, such a partiality might be somewhat excusable; but reason, in its internal fabric and structure, is really as little known to us as instinct or vegetation; and perhaps even that vague, undeterminate word, *Nature,* to which the vulgar refer every thing, is not at the bottom more inexplicable, The effects of these principles are all known to us from experience: but the principles themselves, and their manner of operation are totally unknown: nor is it less intelligible, or less conformable to experience to say, that the world arose by vegetation from a seed shed by another world, than to say that it arose from a divine reason or contrivance, according to the sense in which CLEANTHES understands it. --

"That vegetation and generation, as well as reason, are experienced to be principles of order in nature, is undeniable. If I rest my system of cosmogony on the former, preferably to the latter, 'tis at my choice. The matter seems entirely arbitrary. And when CLEANTHES asks me what is the cause of my great vegetative or generative faculty, I am equally intitled to ask him the cause of his great reasoning principle. These questions we have agreed to forbear on both sides; and it is chiefly his interest on the present occasion to stick to this agreement. Judging by our limited and imperfect {351} experience, generation has some privileges above reason; for we see every day the latter arise from the former, never the former from the latter" --

PHILO proceeds to inform us that he could, in an instant, propose various other systems of cosmogony, which would have some faint appearance of truth; though it is a thousand, a million to one, he says, if any one of them were the true system. -- Motion, we are told, in many instances, from gravity, from elasticity, from electricity, begins in matter, without any known voluntary agent, and to suppose always, in these cases, an unknown voluntary agent, is mere hypothesis; and

hypothesis attended with no advantage; the beginning of motion in matter itself being as conceivable *a priori* as its communication from mind and intelligence.

"All religious systems, it is confessed, says he, are subjects to great and insuperable difficulties. Each disputant triumphs in his turn; while he carries on an offensive war, and exposes the absurdities, barbarities, and pernicious tenets of his antagonist. But all of them, on the whole, prepare a complete triumph for the *Sceptic*; who tells them, that no system ought ever to be embraced with regard to such subjects: for this plain reason, that o absurdity ought ever to be assented to with regard to any subject. A total suspense of judgment is here our only reasonable resource. And if every attack, as is commonly observed, and no defence, among theologians, is successful; how complete must be *his* victory, who remains always, with all mankind, on the offensive, and has himself no fixed station or abiding city, which he is ever, on any occasion, obliged to defend?"

PHILO, in a word, is of opinion, that as no system of cosmogony ought ever to be received from a slight analogy, so neither ought any to be rejected on account of a small incongruity; since that is an inconvenience, from which we can justly pronounce no one to be exempted.

The object of that curious artifice and machinery, which nature has displayed in all animals, PHILO tells us, is the preservation alone of individuals and propagation of the species. It seems enough for her purpose, he says, if such a rank be barely upheld in the universe, without any care or concern for the happiness of the members that compose it. No resource for this purpose: no machinery, in order merely to give pleasure or ease; no fund of pure joy and contentment: no indulgence without some want or necessity, accompanying it. At least, the few phenomena of this nature, we are told, are overbalanced by opposite phenomena of still greater importance.

"Allowing, says he, what never will be believed, at least, what can never possibly be proved, that animals, or at least, human happiness in this life exceeds its misery; we have yet done nothing; for this is not, by any means, what we expect from infinite power, infinite wisdom, and infinite goodness. Why is there any misery at {352} all in the world? Not by chance surely. From some cause then. Is it from the intention of the Deity? But he is almighty. Nothing can shake the solidity of this reasoning, so short, so clear, so decisive; except we assert, that these subjects exceed all human capacity, and that our common measures of truth and falsehood are not applicable to him; a topic, which I have all along insisted on, but which you have, from the beginning, rejected with scorn and indignation.

"But I will be contented to retire still from this intrenchment: for I deny, CLEANTHES, that you can ever force me in it: I will allow, that pain or misery in man is *compatible* with infinite power and goodness in the Deity, even in your sense of these attributes: what are you advanced by all these concessions? A mere possible compatibility is not sufficient. You must *prove* these pure, unmixt, uncontrollable attributes from the present mixt and confused phenomena, and from these alone. A hopeful undertaking! Were the phenomena ever so pure and unmixt, yet being finite, they would be insufficient for that purpose. How much more, where they are also so jarring and discordant?"

There seem to be *four* circumstances, PHILO says, on which depend all, or the greatest part of the ills, that molest sensible creatures, none of which appear to human reason, in the least degree, necessary or unavoidable, nor can we suppose them such, without the utmost licence of imagination.

The *first* circumstance which introduces evil, we are told, is that contrivance of oeconomy or the

animal creation, by which pains as well as pleasures are employed to excite all creatures to action, and make them vigilant in the great work of self-preservation. Now pleasure alone, in its various degrees, seems to human understanding sufficient to this purpose. -- The *second* circumstance is, the conducting of the world by general laws; and this seems no way necessary to a very perfect being. -- The *third* circumstance is, the great frugality, with which all powers and faculties are distributed to every particular being. Nature, 'tis said, seems to have formed an exact calculation of the necessities of her creatures; and like a *rigid master*, has afforded them little more powers or endowments, than what are strictly sufficient to supply those necessities. An *indulgent parent* would have bestowed a large stock, in order to guard against accidents, and secure the happiness and welfare of the creature, in the most unfortunate concurrence of circumstances. Every course of life would not have been so surrounded with precipices, that the least departure from the true path, by mistake or necessity, must involve us in misery and ruin. Some reserve, some fund would have been provided to ensure happiness; nor would the powers and the necessities have been adjusted with so rigid and oeconomy.

The *fourth* circumstance, whence arises the evil and misery of the universe, is the inaccurate workmanship of all the springs {353} and principles of the great machine of nature. One would imagine, PHILO says, that this grand production had not received the last hand of the maker; so little finished is every part, and so coarse are the strokes with which it is executed.

"On the concurrence, then, continues he, of these *four* circumstances does all, or the greatest part of natural evil depend. Were all living creatures incapable of pain, or were the world administered by particular volitions, evil never could have found access into the universe; and were animals endowed with a large stock of powers and faculties, beyond what strict necessity requires; or were the several springs and principles of the universe so accurately framed, as to preserve always the just temperament and medium; there must have been very little ill in comparison of what we feel at present. What then shall we pronounce on this occasion? Shall we say, that these circumstances are not necessary, and that they might easily have been altered in the contrivance of the universe? This decision seems too presumptuous for creatures, so blind and ignorant. Let us be more modest in our conclusions. Let us allow, that, if the goodness of he Deity (I mean a goodness like the human) could be established on any tolerable reasons *a priori*, these phenomena, however untoward, would not be sufficient to subvert that principle; but might easily, in some unknown manner, be reconcilable to it. But let us still assert, that as this goodness is not antecedently established, but must be inferred from the phenomena, there can be no grounds for such an inference, while there are so many ills in the universe, and while these ills might so easily have been remedied, as far as human understanding can be allowed to judge on such a subject. I am sceptic enough to allow, that the bad appearances, notwithstanding all my reasonings, may be compatible with such attributes as you suppose: but surely they can never prove these attributes. Such a conclusion cannot result from scepticism; but must arise from the phenomena, and from our confidence in the reasonings, which we deduce from these phenomena."

In regard to the influence of religious principles on the conduct of mankind, PHILO says, it is certain from experience, that the smallest grain of natural honesty and benevolence has more effect on men's conduct, than the most pompous views, suggested by theological theories and systems. And when we have to do with a man who makes a great profession of religion and devotion; this, we are told, has no other effect upon several, who pass for prudent, than to put them on their guard, lest they be cheated and deceived by him. He further says, that the steady attention alone to so important an interest as that of eternal salvation, is apt to extinguish the benevolent affections,

and beget a narrow, contracted selfishness; and that when such a temper is encouraged, it easily eludes all the general precepts of charity and benevolence. In regard to the worship of the Deity, hear what he says:

> **"*To know God*, says SENECA, *is to worship him*. All other worship is indeed absurd, superstitious, and even impious. It degrades {354} him to the low condition of mankind, who are delighted with intreaty, solicitation, presents, and flattery. Yet is this impiety the smallest of which superstition is guilty. Commonly, it depresses the Deity far below the condition of mankind; and represents him as a capricious demon, who exercises his power without reason, and without humanity. And were that divine Being disposed to be offended at the vices and follies of silly-mortals, who are his own workmanship; ill would it surely fare with the votaries of most popular superstitions. Nor would any of the human race merit his *favour*, but a very few, the philosophical theists, who entertain, or rather indeed endeavour to entertain, suitable notions of his divine perfections: as the only persons, intitled to his *compassion* and *indulgence*, would be the philosophical sceptics, a sect almost equally rare, who, from a natural diffidence of their own capacity, suspend, or endeavour to suspend, all judgment with regard to such sublime and such extraordinary subjects."**

Such are the sentiments, such the doctrines contained in the Dialogues before us; and it is natural now, surely, to ask, what gratitude is due to Mr. Hume for this legacy to the public? If the principles which he has laboured with so much zeal and earnestness to establish to be true, the wicked are set free from every restraint but that of the laws; the virtuous are robbed of their most substantial comforts; every generous ardor of the human mind is damped; the world we live in is a fatherless world; we are chained down to a life full of wretchedness and misery; and we have no hope beyond the grave.

Mr. Hume had been long floating on the boundless and pathless ocean of scepticism; it is natural, therefore, to imagine that, in the evening of his day, he would have been desirous of getting into some peaceful harbour; of breathing a pure air; of viewing a clear and unclouded sky, free from those unwholesome mists that hang over the gloomy regions of darkness and uncertainty; and of passing through the closing scenes of life with tranquillity and pleasing hopes. But his love of paradox, his inordinate pursuit of literary fame, continued, whilst life continued; it is scarce possible, indeed, with the utmost stretch of candour and charity, to assign any other motives for publishing what must shock the sense and virtue of his fellow-mortals, or to reconcile it with the character of a good citizen, and a friend to mankind.

We know it will be said, that Mr. Hume, notwithstanding his principles, was a very benevolent and a very amiable man; we *know* he was, and are as ready to allow him all the praise he is intitled to, on account of his good qualities, as the warmest of his admirers. But, surely, it cannot be inferred from this, that principles have little or no effect on human conduct. A man, who is naturally of a cool dispassionate turn of mind; of a studious disposition; whose education, fortune, and other accidental {355} circumstances, connect him with the upper ranks of life, may not only have fashionable manners, be an agreeable companion, but may, by the mere force of natural temper, be a benevolent, good-humoured man, and act his part in life with great decency. But suppose that Mr. Hume's principles are let loose among mankind, and generally adopted, what will then be the consequence? Will those who think they are to die like brutes, ever act like men? Their language will be, *let us eat and drink, for to-morrow we die*. When men are once led to believe that death puts a final period to their existence, and are set free from the idea of their being accountable creatures,

what is left to restrain them from the gratification of their passions but the authority of the laws? But the best system of laws that can be formed by human wisdom, is far from being sufficient to prevent many of those evils which bread in upon the peace, order, and welfare of society. A man may be a cruel husband, a cruel father, a domestic tyrant; he may seduce his neighbour's wife or his daughter, without having any thing to fear from the law; and if he takes pleasure in the gratification of his irregular appetites, is it to be supposed that he will not gratify them? What, indeed, is to restrain him?

But we leave it to our Readers to pursue these reflexions, -- into which we were naturally led, and for which, we hope, we need make no apology. -- Mr. Hume's Dialogues cannot possibly hurt any man of a philosophical turn, or, indeed, any man of common sense; and it is only the high reputation which the Author of them has so justly acquired by his other writings, and the influence of this reputation, that give them any claim to notice. They may serve, indeed, to confirm the giddy, the profligate, and the unprincipled in their prejudices against religion and virtue, but must be despised by every man who has the smallest grain of seriousness and reflection. No virtuous father will ever recommend them to the perusal of his son, except in point of composition; and every impartial judge must pronounce them unworthy of a writer of such distinguished abilities as Mr. HUME.

PAMPHILUS, a young man, who relates to HERMIPPUS the conversation which passed between Cleanthes, Philo, and Demea, concludes the Dialogues in the following manner. -- "Upon a serious review of the whole, says he, I cannot but think, that Philo's principles are more probable than Demea's; but that those of Cleanthes approach still nearer to the truth." -- Our Readers will make their own comment upon this, and with them we leave it.

Review of Hume's *Essays on Suicide and the Immortality of the Soul*

The Gentleman's Magazine

August 1784

Editor's Note: This review appeared anonymously in August 1784, Volume 54 (Part 2), page 35 of *Gentleman's Magazine*. It was included in the section titled "Impartial and Critical Review of New Publications," and was followed by a review of George Horne's anonymous *Letters on Infidelity*, a work which contains a lengthy critique of Hume's *Dialogues*.

Gentleman's Magazine and Historical Chronicle

August 1784

Vol. 54

Part 2

{607}

***Essays on Suicide, and the Immortality of the Soul, ascribed to the late* David Hume, *Esq. Never before published. With Remarks, intended as an Antidote to the Poison contained in those Performances, by the Editor. To which are added, Two Letters on Suicide, from* Rousseau's Eloisa. 12*mo*.**

THESE Essays, it is well known, were printed and advertised by Mr. Millar, with some others by Mr. Hume, near thirty years ago; but before the day of publication, being intimidated by threats of prosecution, the book-seller called in some copies that he had dispersed, cancelled the two Essays, and (with difficulty) prevailed on Mr. Hume to substitute some others less obnoxious. Some copies,

however, escaped this proscription, and have since been privately sold at a large price. As needy authors evade the patent by writing, or pretending to write, notes on the Bible, the present editor seems to think himself safe from prosecution by supplying this code of infidelity with what he calls "a comment," or "an antidote." A poor evasion, and which, we apprehend, would no more justify the vender of poison of any kind *in foro legis*, than *in foro conscientiae*; as many, who swallow the poison, will not apply the antidote, even were it much stronger than that here administered. And, by adding Rousseau's Letters, the design is obvious. Sophistical and fallacious as are the arguments, we will not, by retailing them, be guilty of a practice that we condemn; but, as a much better antidote than any here prescribed, will recommend the small tract reviewed in our next article, which is supposed to be by the Dean of Canterbury.

Review of Hume's *Essays on Suicide and the Immortality of the Soul*

The Monthly Review

William Rose

June 1784

Editor's Note: This review appeared anonymously in June 1784, Volume 70, pages 427-428 of *The Monthly Review*. William Rose's authorship is established in Benjamin Christie Nangle's, *The Monthly Review First Series 1749-1789* (1934). Although brief, this review appeared in the main article section of that issue (as opposed to the monthly catalog section).

The Monthly Review
June 1784
Vol. 70

{427}
ART. IV. *Essays on Suicide, and the Immortality of the Soul*, ascribed to the late David Hume, Esp; never before published. With Remarks, intended as an Antidote to the Poison contained in these Performances, by the Editor. To which *is* added, two Letters on Suicide, from Rousseau's Eloisa. 12mo. 3 s. 6 s. sewed. Printed for M. Smith, and sold by the Booksellers in Piccadilly, Fleet-Street, and Pater-noster-Row. 1783.

IN a short preface to these *essays* we are told, that they are generally attributed to the late Mr. Hume, though not published in any edition of his works; that the celebrity of the author's name renders them, in some degree, objects of great curiosity; that, owing to this circumstance, a few copies have been clandestinely circulated, for some time, at a large price, but without any comment; that the present publication possesses very superior advantages; and that the *notes* annexed are intended to expose the sophistry contained in the original essays.

The Writer of this article knows that the essays here mentioned were written by Mr. Hume. That almost thirty years ago they made part of a volume, which was publicly advertised to be sold by Mr. Millar; that, before the day fixed for publication, several copies were delivered to some of the Author's friends, who were impatient to see whatever came from his pen; that a noble Lord, still living, threatened to prosecute Mr. Millar, if he published the essays now before us; that the Author, like a bold veteran in the cause of infidelity, was not in the least intimidated by this menace, but that the poor bookseller was terribly frightened, to such a degree, indeed, that he called in all the copies he had delivered, cancelled the two essays, and, with some difficulty, prevailed upon Mr. Hume to substitute some other pieces in the room of those objected to by the noble Lord; that, by some means or other, however, a few copies got abroad, and have been clandestinely circulated, at a large price, as already mentioned.

In regard to the present Editor, though we are far from calling in question the uprightness and benevolence of his intentions, yet we cannot applaud his judgment, or think it equal to his zeal. He does not consider, that while he spreads the antidote, he disseminates the poison at the same time, and seems to resemble a physician, who should take great pains to propagate {428} a distemper, in order to have the credit and advantage arising from the cure. There was, indeed, little, very little danger of the essays doing much mischief. The warmest of Mr. Hume's admirers think them unworthy of him, and every competent judge will, we are fully persuaded, be of opinion that they carry their own confutation along with them. A few examples will be sufficient to shew this.

Mr. Hume affirms, that it is as clear as any purpose of nature can be, that the whole scope and intention of man's creation is limited to the present life, and that those who inculcate the doctrine of a future state, have no other motive but to gain a livelihood, and to acquire power and riches in this world. -- He tells us that, were one to go round the world with an intention of giving a good supper to the righteous, and a sound drubbing to the wicked, he would frequently be embarrassed in his choice, and would find that the merits and the demerits of most men and women scarcely amount to the value of either. -- The life of a man, he says, is of no greater importance to the universe than that of an oyster. -- It would be no crime, we are told, in any man, to divert the Nile or Danube from their courses, were he able to effect such purpose. Where then is the crime, Mr. Hume asks, of turning a few ounces of blood from their natural channel? --

Were a drunken libertine to throw out such nauseous stuff in the presence of his bacchanalian companions, there might be some excuse for him; but were any man to advance such doctrines in the company of sober citizens, men of plain sense and decent manners, no person, we apprehend, would think him entitled to a serious reply, but would hear him with silent contempt.

To combat such opinions requires no great abilities; it is but justice to the Editor, however, to acknowledge that his notes contain some pertinent and judicious reflections.

"Hume's Account of Necessity"

Commonsense: or, The Englishman's Journal

1740

Editor's note: The anonymous author of this essay identifies himself as the author of *An Essay towards demonstrating the Immateriality and Free-Agency of the Soul*, (London, 1740). The aim of the essay is to prevent Hume's account of determinism from having "any mischievous effect upon the opinions or morals of mankind." After a summary of Hume's views on determinism, begins his refutation. The issues of free will and necessary connection, he believes, are related, and that the notion of "necessary connection" is explained by Newton as cohesion, attraction, repulsion and communication of motion. The proof that we are free is that we recognize causal necessity in external objects only because such necessity stands in sharp contrast to human freedom. The mischievous threat of Hume's theory is its implication that our conduct is beyond our control. He agrees that there is a causal-like relation between our motives and the morally significant actions which they elicit, but our feeling of freedom shows that this connection is not absolute. Changing subjects, he argues contrary to Hume that space is indeed infinitely divisible in a speculative sense; for, given any spatial object considered as a whole, it must necessarily be seen to have parts. For a discussion of this essay, see E.C. Mossner, "The First Answer to Hume's *Treatise*: An Unnoticed Item of 1740," in *Journal of the History of Ideas*, 1951, Vol. 12, pp. 291-294.

COMMONSENSE: OR, THE ENGLISHMAN'S JOURNAL

Saturday, July 5, 1740, pp. 1-2

SOME of our Papers being designed for the Learned, and others for the Unlearned, we hope the latter will, in Complaisance to the former, excuse our publishing the following Dissertation, which, we think, may be of great Use, tho' it may not perhaps be so entertaining to those that never have

employed their Thoughts about such Subjects.

***To the* AUTHOR *of* COMMON SENSE.**

SIR,

AS I published lately *An Essay towards demonstrating the Immateriality and Free Agency of the Soul*, which one of your Correspondents has already taken notice of, and as the establishing of both these Doctrines is, in my Opinion necessary for the Establishment of Religion, Virtue, and Morality, nay, and even of *social Liberty* itself, I must beg you'll [by printer] give what follows a Place in your Paper.

The *Liberty* of Human Action is a Doctrine so agreeable to Reason, and to the common Sense of Mankind, that it is never opposed but by those who either lay down to themselves *false Principles*, or *mistake* the *Terms* they make Use of; which is the chief Cause of that impenetrable Obscurity and incomprehensible Jargon, we find in the Writings of almost all those, who have hitherto appeared as *Advocates* for *Necessity*.

Mr. *Collins*, I think, is the only one, who has treated the Subject with any Order or Perspicuity. As he was a Gentleman of a most extensive Genius, and a clear Understanding, he has, indeed, expressed himself so as to be understood; but I have, in the above mentioned Essay, answered every Philosophical Argument he has advanced in favour of *Necessity*; and, I hope, I have done it to the Satisfaction of all those who delight in what is plain and easy, and do not think that every piece of *Metaphysicks* ought to *soar* above the *common Reach* of *Human Capacity*.

What follows, I intend as a *short* Answer to a *long* Book lately published, intitled, *A Treatise of Human Nature*, the Author of which seems, if I understand him, which, I profess, I am not quite sure of, to adopt the *Doctrine of Necessity*, in the 4th and last Part of the 2d Book of his *tedious* Performance; but, according to Custom, he stumbles at his first setting out.

He desires it may be observed, and I desire it too, "That by the *Will*, he means nothing but *the internal Impression we feel and are conscious of, when we knowingly give Rise to any new Motion of our Body, or new Perception of our Mind*".[2] Now, does not every one see, that by this Definition he means, if he means what every understanding Man must mean, not the *Will*, or what we call the *Act of Volition*. After this Definition he goes on thus. '[printer?] This Impression; (meaning the *Will*) like the preceding ones of Pride and Humility, Love and Hatred, 'tis impossible to define, and needless to describe any farther, &c." What Pity it is, he did not think of this before he gave us his Definition? But by his Favour, if I understand the *English* Language, (which is generally the Dispute among *Metaphysicians*) neither the Will, nor Pride of Humility, nor Love or Hatred, ought to be called *Impressions*. The *Will* is a *Faculty*; and *Pride, Humility, Love*, and *Hatred* are *Passions* of the *Human Soul*.

Then he tells us, "Every Object (*material* he means) is determined by an *absolute Fate* to a certain Degree and direction of its Motion. &c".[3] But I, as a *Philosopher*, and as a *Christian*, must say, that no *material* Object is determined by an *absolute Fate* to any Thing; for all Objects, *meerly material*, are determined in their Motions and Directions, by those *Qualities* which were *given* to them, and still *preserved* in them, *by God Almighty*, as I have shewn in my Essay, Chap. 9th.

After having established, as he supposes, the *absolute Fate* by which the Motions and Directions of *material Objects* are determined, he proceeds to examine the Motions and Directions, or rather the *Actions*, of the *Mind*, and tells us, "That in no single Instance the *ultimate Connexion* of any Objects is discoverable, either by our Senses or Reason, and that we can never penetrate so far into the

Essence and Construction of Bodies, as to perceive the *Principle*, on which their mutual Influence depends. 'Tis their *constant Union* alone, with which we are acquainted; and 'tis from the *constant Union* the *Necessity* arises. If Objects had not an uniform and regular Conjunction with each other, we should never arrive at any Idea of Cause and Effect; and even after all, the *Necessity* which enters into that Idea, is nothing but a Determination of the Mind to pass from one Object to its usual Attendant, and infer the Existence of one from that of the other.[4]

I shall take no Notice of this *Novel* Sort of Diction, because most *Metaphysicians*, to the great prejudice of the Science, affect to think, and to express their Thoughts, in a Method *peculiar* to themselves; but I must observe, that if the Author had read, and considered (for there is a great Difference) the *Philosophical* Works of the great *Sir Isaac Newton*, he would have perceived, that the *ultimate Connexion* of Objects, (by which, I suppose, he means *Causes* and *Effects*) so far as it depends upon, or proceeds from any *Quality* in *Matter*, has been discovered, and that it depends upon or proceeds from Cohesion, Attraction, Repulsion, and Communication of Motion, which are Qualities *given* in different Degrees to *Matter*, by the *Author of Nature*, as I have, after *Sir Isaac Newton*, shewn in the 9th Chapter of my Essay.

But suppose, these four Qualities depended upon, or proceeded from some other Quality or Qualities as yet unknown, neither they, nor those Qualities upon which they depend, nor any *essential* or *accidental* Quality that is, or can be in *Matter*, can properly be said to be the *first Principle*, on which the mutual Influence of Bodies depends. Because, as *Matter is in itself absolutely passive*, no Part of Matter can ever *of itself* act upon itself, or upon any other Part of *Matter*; and consequently, *Matter* can never of *itself* produce any Effect. Therefore, that *active Being*, supreme or subordinate, which we call *Spirit*, must be the *first Principle*, on which the mutual Influence of Bodies must always *originally* depend. This, I think, I have fully shewn in my said Essay; and the Author will, I believe, be of my opinion, if he will but *descend* from those *Clouds* where he now seems to *wander*, and deign to *tread* upon the *Low*, but *solid* Surface of *common Apprehension*.

Now, with Regard to the Origin of that Idea we call *Necessity*, the Author will see by reading my Essay Chap. 4th and 11th, that we never should, nor ever could have formed an Idea of *Necessity* or *necessary* Motion, if we had not perceived in ourselves a Motion *that is not necessary*; and that with Regard to the Motion of any *external* Object, it is not from any *necessary Connexion*, or *constant Union* between Cause and Effect, that we determine the Motion to be *necessary or voluntary*; because we see many Motions or Effects, the Cause of which we neither see nor can perceive: It is from *Observation* and *Examination* only, we *in this Case* determine; and for this very Reason, we are often liable to be deceived in our Judgments about the *Necessity* or *Freedom* of *external* Motions or Effects.

As for the Author's Proof from Experience, that there is a *constant Union* between our Actions of one Side, and our Motives, Tempers, or Circumstances of the other, I shall grant that the latter have a very great Influence upon the former; and it is upon this, that *moral Certainty*, or what he calls *moral Evidence*, depends: But every Man must be convinced from what he feels within himself, that this Influence is not *absolute* and *necessary*; and *Self Conviction* is a much stronger Proof than any we can have from our *Observation* of external Objects, because we cannot know their Tempers and Circumstances, and much less the Motives they are governed by, so well as we do our own.

This, I believe, will be sufficient for preventing my Author's *Philosophy* from having nay *mischievous* Effect upon the Opinions or Morals of Mankind; and, indeed, I should have taken no

Notice of what he has wrote, if I had not thought his Book, in several Parts, so very abstruse and perplex'd, that, I am convinced, no Man can comprehend what he means; and as one of the greatest Wits of this Age has justly observed, this may impose upon weak Readers, and make them imagine, there is a great Deal of *deep Learining* in it, because they *do not understand it*.

But as the same Author, in the 2d Part of his first Book sets himself up in Opposition to the now General, and, I think, Self-evident Opinion, That *Space* is *Divisible in infinitum*, I must have a Word with him upon that Subject, before I leave him. His very first Argument is founded upon a *false Position*: He affirms, that it is a Contradiction to suppose, that nay *finite* Part of *Space* contains an *infinite* Number of *Parts*. This is so far from being a Contradiction, that it is certainly true, as every Man who understands any Thing of the Nature of *Infinites*, or even of *Space* itself, must acknowledge; for tho' a certain *Magnitude* be necessary, for an *actual* Division of any Thing that be necessary, for an *actual* Division of any Thing that can be divided, or for rendering the *Parts perceptible* to us after they are divided, yet the *Magnitude* of an Object has nothing to do with its *speculative Divisibility*, nor does the one in the least contribute to, or derogate from the other. We may consider an Object as a *Whole*, without at that Time comparing our Idea called *Whole*, with our Idea called *Parts*, which is the Case in *Mathematicks*; for a *Mathematician's* Demonstration will hold as true, when he takes a *Church* or a *City* for his *Mathematical* Point, as when he takes a *Point* almost *imperceptible* to the Eye, tho' assisted by the best magnifying Glass. But when we do actually compare our Idea called *Whole*, with our Idea called *Parts*, it is as impossible for us to suppose a *Whole*, without *Parts*, as it is to suppose it without *Figure* or *Extension*.

I shall therefore give myself no farther Trouble about my Author's Arguments for shewing, that *Space* is not *infinitely* divisible; for, in Truth, they seem to be as *indivisible* as his *Space*. But I must ask him, whether he can suppose any Part of *Space* to be void of Extension? If he does, I will say, that he supposes it to be void of one of the *most essential* Qualities of *Space*; and if he does not, he must then grant, that every Part of *Space* is *Divisible*, or has *Parts*, and so on *in infinitum*: for if I remember any Thing of the old Philosophy I learned at School, the Definition of *Extension* was, *Quod habet Partes extra partes*; and I am very sure, that if any *Part* of *Space* could not be supposed to have *partes extra partes*, that is to say, it could not be supposed to have any *Extension*.

I shall conclude my Remarks upon this modern Piece of *Philosophy* with observing, that when we speak *properly*, it is a very *improper* Question to ask, if *Space* be *divisible in infinitum*? Every Part of *Space*, the *smallest* we can imagine, must be supposed to have *Parts*, that is to say, it must be supposed to have *Extension*; for this is all we can mean by the *Divisibility* of *Space*; because *no Part* of *Space*, the most *immense* or *largest* we can imagine, can be *actually* divided; that is to say, it is impossible to *divide Space* as we do *Matter*, by removing or destroying that *Contiguity* which is between any two of its *Parts*; therefore, I hope, my Readers will suppose, that I have talked of the *infinite Divisibility of Space*, only in Complaisance to my Author and in order to lead him, if possible, into a right Way of thinking about those Subjects, upon which he has wrote such a *Huge* Treatise.

And now I must beg his Pardon for the Freedom I have taken with him. I can upon Honour declare, I never had the least Intimation, who he is; so that my *Criticism* cannot proceed from any *Malice* or *Ill-will*. It proceeds entirely from the Regard I have for that Science called *Metaphysicks*: A Science which is in itself of great *Dignity*, because it may do infinite Service to Religion, Virtue, and Morality, and consequently to *Religious* as well as *Civil Liberty*, when handled in a natural and concise Manner; but it does infinite Mischief, when, *by departing from Nature*, it is rendered

obscure, perplex'd and *contemptible*, as it has *designedly* been for many Ages by those who were, and still are, endeavouring to *rob* Mankind of their *Liberities*, both *religious* and *civil*, by rendering every Man an *implicit Believer* in whatever *Opinions* they may think fit to *propagate*, and an *abject Slave* to whatever *Commands* they may have a Mind to *impose*.

It is this, and this chiefly, that interests me so much in the cause of *Metaphysicks*. *It is by them, and them only, we can naturally* come at the Knowledge of our own Soul or Spirit, and of the supreme Spirit that has created, and still governs the Universe; which I call *Religion*: it is by them, and them only, we can *naturally* come at the knowledge of those Duties we owe to Mankind, our Country, and our Friends, which I call *Virtue*; and it is by them, and them only, we can *naturally* come at the Knowledge of those Duties we owe to Mankind, our Country, and our Friends, which I call *Virtue*; and it is by them, and them only, we can *naturally* come at the Knowledge of those Duties we owe to our Neighbors and ourselves, which I call *Morality*. Therefore, it behoves Mankind to have the Science of *Metaphysicks* as fully and clearly explained as possible: It is an *Injury* to *Human Nature* to render it obscure and perplex'd through Ignorance or Want of Capacity: It is a *Most flagitious Crime* to do so *designedly*, for the Sake of any *private view*; or for the Sake of *propagating* any *particular Sect* of Religion, or any *Selfish Party* in Politicks. *I am, Sir,*

Your constant Reader

and humble Servant.

"Hume on Miracles"

A Selection from Unpublished Papers of the Right Reverend William Warburton

William Warburton

a. 1749

Editor's note: William Warburton (1698-1779) was bishop of Gloucester and was known for his editions of Shakespeare and Pope, his attack on deism in the *Divine legation of Moses demonstrated....* (1737-1741), and his involvement in numerous controversies. Warburton's primary attack on Hume is in his *Remarks on... the Natural History of Religion*, 1757 (see the Hume Archives edition of that work). Mossner argues that Warburton may have been the anonymous reviewer of Hume's *Treatise* in the *History of the Works of the Learned*; however, Robert M. Ryley ably refutes this view in "Did Warburton Review Hume's *A Treatise of Human Nature*?" in *Notes and Queries*, 1976, Vol. 23, pp. 354-355. Warburton's first acquaintance with Hume, then, is indicated in a 1749 letter to Richard Hurd:

> **I am strongly tempted too to have a stroke at Hume in parting. He is the author of a little book called "Philosophical Essays," in one part of which he argues against the being of a God, and in another, (very needlessly you will say,) against the possibility of miracles. He has crowned the liberty of the press. And yet he has a considerable post under the Government. I have a great mind to do justice on his arguments against miracles, which I think might be done in a few words. But does he deserve notice? Is he known amongst you? Pray answer me these questions. For if his own weight keeps him down, I should be sorry to contribute to his advancement to any place but the pillory. (William Warburton, *Letters from a Late Eminent Prelate to One of his Friends*, Boston: 1806 p. 10).**

Warburton did write his brief attack on Hume's discussion of miracles, although it remained unpublished for almost 100 years. The essay is reproduced here as it appears in Francis Kilvert's *A*

Selection from Unpublished Papers of the Right Reverend William Warburton (London: John Bowyer Nichols and Son, 1841), pp. 311-315.

A SELECTION FROM UNPUBLISHED PAPERS OF WILLIAM WARBURTON

{311}

A late writer, who entitles his book Philosophical Essays concerning Human Understanding, printed for A. Millar, 1748, has a Discourse on Miracles, in which he endeavours to show that there is no probable evidence of the truth of such facts. His reasoning is summed up in what he calls "a general *maxim* worthy our attention, that no testimony is sufficient to establish a miracle, unless the testimony be of such a kind that its falsehood would be *more miraculous* than the fact which it endeavours to establish; and even in that case there is a mutual destruction of arguments, and the superior only gives us an assurance suitable to that degree of force which remains after deducting the inferior."

Now, to pass at present the jargon of his *more miraculous*, and to suppose he may mean a testimony whose falsehood implies a miracle, I answer, that in order to render the miraculous fact related the object of our belief, it is not necessary that the falsehood of the relator should imply a miracle; and for this plain reason, because that testimony whose falsehood implies a miracle makes the fact attested not *credible*, but *certain*; for the falsehood of no testimony but the *testimony of sense* implies a miracle. Now, what the senses inform us of we call certain. If they deceive us, it must be by God's altering the established order of things, which this author agrees to be a true definition of a miracle; so that we see he mistakes the very nature of the evidence in question. But would you know why he uses his nonsense of *more miraculous*, instead of *miraculous*, it is to insinuate that *even the evidence of sense* is no sufficient proof of a miracle; for he confesses that the degree of evidence, in the case here put, is only the *remains* of his *more miraculous*, when the quantity in his *less miraculous* has been *deducted*; so the if the falsehood of the testimony and the fact testified were equally miraculous, from thence, we see, no proof would arise; i.e. we ought not to own the truth of a miraculous fact when it makes its appeal to the senses. But if this man's reasoning cannot verify his own maxim, his passions will at least verify that of our Heavenly Master, who long ago pronounced that "He who will not believe Moses and the Prophets will not believe though one arose from the dead."

But the unhappy man would exclude all miracles, because at all hazards he will exclude Christianity, as appears from another of his maxims, for he is not a dealer in small truths: "We may establish it as a maxim (says he), that no human testimony can have such force as to prove a miracle, and make it a just foundation for any *such* system of religion," i.e. no possible proof can be given of miracles to establish any revelation or popular religion, as he just before expresses it; for he himself, forsooth, is of the religion of the philosophers. Yet, when, he has said this, with an impartiality becoming the most *moral* of his tribe, he adds the following corrective; that in miracles, where religion has nothing to do, we may safely believe a miracle: If (says he) all authors agree that from 1st Jan. 1600 there was a total darkness over the whole earth for eight days, it is evident our present philosophers ought to receive it for a certain fact; but, should all the historians

who treat of England agree that 1st Jan. 1600 Queen Elizabeth died, (who here, you are to observe, stands for Christ,) that she afterwards rose again, took possession of the throne, and governed publicly for three years, this you are to reject as an arrant fable. His spite, we see, is not against miracles, but only against the workers of them; for why, I pray you, are we to make this distinction? Are not the two facts equally attested by the concurrent evidence of all concerned? Are they not equally miraculous? for the absence of the sun eight days together from the globe of the earth is surely as *contrary* to the common course of nature as the resurrection of one from the dead. If he believes that, from the beginning, none ever rose from the dead, he believes, too, that there never was a total darkness for eight days together. Here, then, the *uniform experience*, as he calls it, is, in both cases, the same; yet we must believe the one, and not the other. Here spoke the true sense, as well as spirit, of modern infidelity; -- we must reject *that* miracle, for whose working, by the interposition of God, we *can* give a reasonable account, and embrace that for which there is *no account to be given at all*. But this circumstance of the *cause* of working the miracles recorded in Scripture, so worthy the exertion of the Divine power, is always, either for want of sense or honesty, omitted by this author, when he comes to balance what he calls his opposed proofs, on which all his jargon turns. And well would it be for our *moral philosopher* if this was the only one omitted; but every collateral circumstance that affords internal evidence of the truth of the Evangelic testimony, such as the state of the world that follows, and which must have been that very state consequent on miracles, had miracles been really performed; such again as the accomplishment of predictions recorded in books, as well known to be written after the facts, as that Julius Caesar's Commentaries was written before the time of Henry VIII.; -- none of these, I say, are ever brought into the balance of this fair accountant. Very suitably, therefore, is his reasoning supported on each hand, and of a piece with the modesty of his *introduction* and the decency of his *conclusion*.

Thus he begins: "I flatter myself that I have *discovered* an argument, which, if just, will with the wise and learned be an *everlasting check* to all kinds of superstitious delusion, and, consequently, will be *useful as long as the world endures*." Thus he ends: -- "Mere reason is insufficient to convince us of the veracity of the Christian religion; and whoever is moved by *faith* to assent to it, is conscious of a continued *miracle* in his own person, which *subverts all the principles of his understanding*, and gives him a demonstration to believe what is most contrary to custom and experience."

Who, after this, will scruple to own that *freedom of thinking* is the source of our greatest blessings, and that the liberty of the press is the only means of conveying and preserving them pure and unpolluted to our posterity!!!

The Credibility of Miracles Defended

Thomas Rutherforth

1751

Editor's Note: The *Monthly Review* opens their neutral review of Rutherforth's pamphlet with the following: "IN this discourse, the learned Dr. *Rutherforth* lays before his readers some observations upon the measures of credibility, in order to shew that the argument urged by Mr. *Hume* against miracles, is inconclusive; and that no supernatural degree of testimony is necessaryily required to prove the existence of a miracle" (1751, Vol. 5, pp. 358-361).

The Credibility of Miracles defended
Against the Author of
Philosophical Essays
IN A
DISCOURSE
DELIVERED AT THE
PRIMARY VISITATION
OF
THE RIGHT REVEREND
FATHER IN GOD
THOMAS
LORD BISHOP OF ELY
IN
ST. MICHAELS CHURCH

CAMBRIDGE
AVG. XXIX

MDCCLI.

BY
T[HOMAS]. RUTHERFORTH D.D. CHAPLAIN TO HER ROYAL HIGHNESS THE PRINCESS DOWAGER OF WALES.

TO
THE RIGHT REVEREND
FATHER IN GOD
THOMAS
LORD BISHOP OF ELY.

MY LORD,

AS I am encouraged to print the following discourse by the favourable notice, which you wee pleased to take of it, in your most excellent charge to your clergy, before whom I delivered it; this alone might be a sufficient reason for me to beg, that I may have the honour of sending it abroad under your Lordship's patronage. But I had another reason for desiring to address myself to your Lordship upon this occasion: it would be, I thought, the most public, and therefore the best, opportunity of testifying my just sense of the many and signal instances of goodness and generosity, which I have received from your Lordship. The favours, which you have been pleased to confer upon me, are great indeed in themselves, and may justly claim the most sincere acknowledgments and the best returns of gratitude, that I am able to make: but the graceful manner, in which they were conferred, has doubled the value of them. Your Lordship's noble and truly christian spirit has in this respect, as in many others, most eminently distinguished you from the rest of the world, by engaging you to seek for opportunities of exercising your bounty, and to prevent, not only the solicitations, but even the wishes of those, who stand in need of your protection and assistance. That they may long be blessed with such a patron and friend, as they are sure of finding in your lordship, and that you may long enjoy all the happiness, which providence can bestow upon one of its best and most faithful instruments in doing good; is, my Lord, the constant and devoutest wish of

Your Lordship's most obliged

and most dutiful servant
THOMAS RUTHERFORTH.

THE CREDIBILITY OF MIRACLES DEFENDED

JOHN XX. 30, 31.

MANY OTHER SIGNS TRULY DID JESUS IN THE PRESENCE OF HIS DISCIPLES WHICH ARE NOT WRITTEN IN THIS BOOK: BUT THESE ARE WRITTEN THAT YE MIGHT BELIEVE, THAT JESUS CHRIST IS THE SON OF GOD.

THE sacred historian hath here informed us with what view he recorded the miracles of Christ: he designed to convince his readers, that the person, who could do such mighty works, must have a commission from God, to teach his will to mankind. And the defenders of christianity have always imagined, that the miracles, which are related in the new testament, and are there said to have been wrought by Christ and his apostles, may be urged as an undeniable evidence in favour of our religion; provided they can make it appear, that the reality of them is evinced by such testimony, as would be sufficient to establish the truth of any matter of fact, beyond all contradiction.{2}

But the state of this question hath been lately much altered. Instead of being called upon to clear up the testimony, which supports the miracles of Christ and his apostles; we are now challenged to shew, that any testimony whatsoever can be sufficient to prove the truth of these, or of any other miracles.

[2]"A miracle, we are told, is a violation of the laws of nature: for nothing is esteemed a miracle, if it ever happens in the common course of things. And consequently; since a firm and unalterable experience hath established those laws; there must be a firm and unalterable experience against every miraculous event. But in the judgments which we pass upon matters of fact, such an experience as this amounts to a full and direct proof. We have therefore, from the nature of the fact, a full and direct proof against the existence of any miracle. If then a miracle, with such a proof against it, can be rendered credible; it must be by an opposite proof, which is superiour. Therefore no proof from report can evince the existence of a miracle; unless it over-balances the opposite proof from the nature of the fact: or, no testimony can be sufficient to establish the belief of a miracle; unless the falsehood of the testimony would be more miraculous, than the event, which it endeavours to establish." {3}

The confidence, with which this difficulty is urged against the belief of the gospel, hath made it our duty to examine into the merits of it. I intend therefore, in the following discourse, to employ your

thoughts upon this subject, by laying before you some observations upon the measures of credibility, which will assist us in shewing, that this argument is inconclusive, and that no supernatural degree of testimony is necessarily required to prove the existence of a miracle.

Where we have no knowledge or certainty of a fact, by having been eye-witnesses of it; the measures of credibility, make use of to form a judgment upon the truth of falshood of it, are the conformity or consistency of it with our experience; the conformity or consistency of it with our knowledge in general; and the testimony of other men, who vouch the evidence of their senses.

Matters of fact have three different degrees of credibility, in the nature of the thing, arising from their conformity or consistency with our experience.

First, there are some events which we have always found to be brought about steadily and constantly, at stated times, and in certain places, without the least irregularity or exception. The existence of these events is taken for granted; we assure ourselves upon the evidence of such an uniform experience, that they will happen at the usual {4} time and place, without requiring any testimony to prove it. We never think of disputing whether the sun will rise to morrow morning, or of disbelieving, that the tide came in yesterday. The exact likeness between these facts and others, which we have seen and known to be true, induces us to admit them without any hesitation: we take them for truth, because they have, in all respects, a full and perfect resemblance of it.

Secondly; some events have a less exact and less striking likeness of the truth; we find them conformable to our experience in most respects, but not in all. It is most agreeable to what hath commonly been observed to happen, that, in England, there should be frost in some particular week of december, and thunder in some particular week of june. The general resemblance of the truth, which we find in events of this sort, makes us think them likely to be true, and inclines us to believe them. But because they have been sometimes known to fail, and are therefore in some points unlike the truth; the credibility, which they have, in the nature of the thing, does not amount to a full proof of their existence. When we have had no opportunity of observing them ourselves, and cannot ascertain their existence by the evidence of our own senses; we are ready to believe, upon the evidence of our former experience, that they have happened: but our belief is never so fixed as to be raised to {5} any degree of assurance or confidence without the help of testimony.

Thirdly; in respect of some events we have equal experience both ways; and in respect of some others we have no experience either way.[3] That it should thunder on a man's right hand, is not more conformable to our experience than that it should thunder on his left. That there lived in Rome such a man as Julius Caesar; that he was a general, and won a battle against another called Pompey; are facts, about which we have no experience at all. Such events as these are looked upon to be credible in themselves, only because they furnish no cause of doubt from the nature of the thing. They might perhaps with more propriety be called indifferent in themselves: because, as, from the nature of the thing, they furnish no cause of doubt, so neither do they furnish any cause of belief. But whether we call them credible or indifferent; they are confessedly capable of being proved by a fair testimony.

These are the degrees of credibility, which arise from the conformity or consistency of an event from the conformity or consistency of an event with our experience: and we shall find upon inquiry, that the same degrees of credibility arise from its conformity or consistency with our knowledge. For the credibility of events is indeed nothing more than their likeness to the truth. Whenever therefore we find them stamped with this image, {6} it gives them a currency: whether the truth, whose image they bear, is the object of experience or the object of knowledge; whether

we came into possession of it by the immediate perception of our senses, or by induction and conclusions of reason.

First; some facts have in all respects an exact conformity with our knowledge: such as these are admitted for true, upon the credit of their full and perfect resemblance of the truth, without any testimony to vouch for them. When by the help of observations, and by reasoning upon such general conclusions as are deducible from them, we have demonstrated, that the moon is retained in its orbit by the force of gravity; the resemblance, which we find, in all points, between the motion of the moon round the earth, and the motions of the satellites round jupiter, determines us to believe, with an assurance little inferiour to certainty, that these bodies are likewise retained in their respective orbits by the same force of gravity.

Secondly; when a fact is conformable to our knowledge in most respects, but not in all, its likeness to the truth makes it credible, and inclines us to believe it. The want of a more exact and minute likeness may, if we consider only the nature of the fact, leave some room to doubt of its existence: but the report of credible witnesses never fails to over-rule this doubt and to establish the belief of it. Whatever probability we may have {7} from experience, that there will be frost in England, in some particular week of december, and thunder in some particular week of june; we have the same probability from our knowledge of the globe, that, in the opposite souther latitude, there will be frost in some particular week of december. One of these facts is made credible by its conformity with our knowledge; both of them are so far credible in themselves that they may easily be established by testimony; and neither of them can be effectually established without it.

Thirdly; some events may happen either way, and yet be equally conformable to our knowledge; others are so far consistent with it, that they may be true, without contradicting any other truth, that we are certain of. Such events as these, being indifferent or credible in themselves, on account of their conformity or consistency with our knowledge, furnish no cause of doubt from the nature of the thing, and are therefore capable of being proved by a fair testimony. When a man plays, with an equal chance against him, his winning or his losing are equally conformable with our knowledge in the doctrine of chances. The planet mars may have a satellite consistently with all our knowledge of the causes, which govern the system of the world. Neither of these facts have such a credibility in themselves as can determine us rather {8} to believe, than to doubt of them: but both of them are so far credible in the nature of the thing, from their conformity of consistency with our knowledge, that a fair testimony would prove on one instance, that the player hath lost, and in the other, that mars hath a satellite.

Perhaps it may be said, that we cannot come at any certainty or knowledge of the real existence of facts, but from the evidence of our senses, that knowledge or experience of facts must therefore be only different names for the same thing; and consequently that conformity with knowledge is not a distinct measure of credibility from conformity with experience. It must indeed be allowed, that all our reasonings, about the laws and order of nature, will be precarious and fantastical, unless they proceed upon experiments and observation. But when we have thus gained some footing, or ground, as it were, to stand upon; our reason can survey from thence many parts of nature, which our senses were unable to discover. Suppose we have determined, by observations, the proportion between the respective distances of the planets from the sun, and the periodical times, in which they describe their orbits: our experience of facts stops here; but our knowledge of them reaches farther. Our reason, proceeding upon these informations of sense, demonstrates the law of that force, which continually urges the planets towards the sun. Thus we arrive at a certain knowledge of this latter fact, {9} though the former only hath been, or indeed can be, the object of experience.

But, when I distinguish between experience and knowledge, I would not be understood to mean, that they differ any otherwise, than as the part differs from the whole. Every certain perception of the truth, whether we obtain it by our reason or our senses, is knowledge. All our experience therefore must be allowed to be knowledge. But then I would contend, that all our knowledge is not experience. For as some truths, relating to real existence are perceived immediately by our senses; so there are others, which we discover by induction and conclusions of reason. And since the resemblance of truth is the inducement of probability, upon which we admit facts to be true; conformity with experience is planely too scanty a measure of credibility, because experience is not the only way of discovering truth.

I designed, by the foregoing observations, to establish these two conclusions, -- First; that events are made as credible, in the nature of the thing, by their conformity or consistency with our knowledge, as they are by their conformity or consistency with our experience; -- And secondly; that, when events, which are conformable to our knowledge or consistent with it, are supported by a fair testimony, our assent to them is well-grounded.

Allow us the truth of these two conclusions, which we have proved already; and allow us besides, {10} what we can prove, if you deny it, that we have a demonstrative knowledge of the existence, the power, the wisdom, and the goodness of God; and by the help of these principles, we shall be able to unravel all the fallacy of your argument, and to shew you, that miracles do not require any supernatural degree of testimony to establish our belief of them. A firm and invariable experience amounts to a full proof; -- You would have done well to inform us what it is, which such an experience proves in so decisive a manner. You may have observed the ordinary course of nature, with diligence and exactness, and may have discovered what sort of events are produced, steadily and constantly, in the usual train of causes and effects. From hence you may determine, with the highest probability, that no events, which are repugnant to {11} these, can be produced by the same causes operating in the same manner, or by the ordinary powers of nature, which are the objects of your experience. But your proof from experience can go no farther. When you have observed what events are, constantly and uniformly, brought about by the operation of those laws, which the author of nature originally established; by the qualities, which he impressed upon matter; or by the powers, which he bestowed upon his creatures; you have then acquired a firm and invariable experience. But such an experience will never prove, that no events, which are repugnant to these, can be brought about by the immediate interposition of him, who established these laws, and can over-rule them; who impressed these qualities, and can suspend their operations; who bestowed these powers, and can either control or augment them. For the force of an argument, deduced from experience, can extend no farther, than the experience extends, from whence you deduce it. Your experience of the ordinary powers of nature may be a decisive proof, in respect of those powers, which are the immediate objects of it: but it can be no proof at all, in respect of a power superiour to nature, which is not the immediate object of experience, but of demonstrative knowledge.

Your other fundamental principle is, -- That no event can be looked upon as a miracle, unless there is a firm and unalterable experience against it. -- {12} The expression here is vague and indeterminate, and we may perhaps mistake your meaning, unless we ascertain it, by looking back to the first principles, from whence this position is inferred. You define a miracle to be a violation of the laws of nature; and, because a firm and unalterable experience hath established those laws, you infer, that there must be such an experience against every miraculous event. You have here shewn evidently, that the experience, upon which we establish our notions of the laws of nature, is

repugnant to every miraculous event; or, that every miracle is inconsistent with our experience of the common and visible train of causes and effects. But we must caution you, when you apply this inference, not to confound experience with knowledge, or the common course and laws of nature with the power of him, who is the father of nature, and established its laws. You may certainly infer, from your definition of a miracle, that no event can be called by this name, unless it is inconsistent with our experience of the common course of nature. But the same definition will not justify the only inference, which can serve your purpose; you cannot infer from it, that every miracle is inconsistent with our knowledge of the power of God.

We have now examined your fundamental principles separately, and have seen how far they are true: let us next consider them together, and try what conclusion will come out from them. Suppose {13} then your argument to be thus stated.-- A firm and unalterable experience of the common course of nature is a full and direct proof, that no event, which is inconsistent with it, can be brought about by any power, which is the object of our knowledge, or which we know of -- But we have a constant and unalterable experience of the common course of nature to oppose to every miraculous event. -- Your regular conclusion from hence would be, that we have a full and direct proof, against the likelihood or possibility of bringing about a miraculous event by any power, which is the object of our knowledge. -- But such a conclusion, though it is regularly deduced from the principles laid down, is not true: because one of the principles, from whence you deduce {14} it, is false. A firm and unalterable experience of the common course of nature is indeed a direct proof, that no event, which is inconsistent with the usual train of causes and effects, can be brought about by any of the ordinary powers of nature, which are the objects of this experience. But we have already shewn you, that the same experience is not proof at all, against the likelihood or possibility of bringing about such an event by a power, which is superiour to the common course of nature, a power, which we can demonstrate to exist, and which is consequently the object of our knowledge.

Let us try whether your conclusion will succeed better, if the principles, from which you deduce it, are stated in another manner. -- A firm and invariable experience of the common course of nature is a full and direct proof, that no event, which is inconsistent with it, can be produced by the ordinary powers of nature, which are the objects of this experience. -- But every miraculous event is inconsistent with our knowledge of all the powers, that exist. -- The logicians would tell you, that no regular conclusion can be drawn from these premises; because your syllogism will have four terms in it. And common sense will tell you, that no true conclusion can be drawn from them; because one of them is false. We allow indeed, that every miracle must, from the notion of it, be inconsistent with our experience of the common course of nature: but you have not proved, and we think you cannot prove, that it must likewise, from the notion of it, be inconsistent with our demonstrative knowledge of the power of God.

There is still this third shape, in which your argument may be stated. -- A firm and unalterable experience of the common course of nature is a full and direct proof, that no event, which is inconsistent with it, can be produced by the ordinary powers of nature, which are the objects of this experience. -- But every miraculous event must, from the notion of it, be inconsistent with our experience of the common course of nature. -- We grant, that your premises are true, when they are thus stated. But if you would conclude, {15} -- that we have a full and direct proof, against the production of a miracle by any powers, which are the objects of our knowledge; -- such a conclusion must be false; because it contains more than is contained in the premises. Your premises relate only to the ordinary powers of nature, which are the objects of experience; but your conclusion extends itself to a power, which is superiour to the common course of nature, and

is the object of our knowledge. The only regular conclusion, which can be deduced from these premises, is, -- that we have a full and direct proof, against the production of a miracle by any of the ordinary powers of nature, which are the objects of our senses, or common experience. -- You must content yourself with this conclusion: for when the principles, from whence you argue, are so explaned as to be true, they will justify no other. And this is such a conclusion, as the defenders of christianity have no reason to be afraid of.

In answering this argument, I have laid open the grounds of our assent to the existence of a miracle. Such an event is inconsistent with our experience of the common course of things, and would therefore be, in itself, incredible, and incapable of being proved by any testimony, if we knew nothing of any power existing in the universe, besides those, which are employed in carrying on the visible train of causes and effects. But knowledge reached farther than experience: reason {16} leads us on from those powers, which are the objects of sense, to another, which is superiour to them, to the power of him, who, as he at first established the laws, and settled the course of what we commonly mean by the word nature, can therefore, when he pleases, suspend or over-rule them. The existence of a miracle hath a general conformity of consistency with our knowledge of such a power: and this conformity or consistency with our knowledge gives it credibility enough, in the nature of the thing , to render it capable of being proved by a fair testimony.

From hence it appears, that when we reject any miraculous event as spurious, which comes to us well attested; our reason for this conduct either is not, or ought not to be, any pretended proof against it, from the general nature of all miracles. For a miracle, considered merely as a supernatural change in the common course of things, is consistent with our knowledge of God's power: and no events, which are consistent with our knowledge, furnish any cause of doubt or suspicion about their existence, and much less any presumption or proof against it, from the nature of the thing. And yet we reject the miracles and prodigies, which we find related in pagan histories, and popish legends; notwithstanding some of them are supported by such a testimony, as might, if we were to give ourselves the trouble of examining it, be found unexceptionable in itself, or sufficient, at least, to establish the truth of {17} any common matter of fact. Upon what grounds then, it may be asked, can we justify our rejecting these miracles; if there is no presumption against them, from the nature of miracles in general, and we either do not examine the testimony, which supports them, or find no exceptions against it, when we do? They, who make this enquiry, might, if they attended to the matter, find a third reason for rejecting many particular miracles, besides the two, which are here suggested. Though we have no objections, from the nature of the thing, that can be urged with any force against miracles in general; yet there are frequently such circumstances appear in the relation of particular miracles, as will afford unanswerable objections to the truth of them. If the circumstances of any particular miracle do either directly, or by necessary consequence, exclude the power of every being, who can change the common course of things, such a miracle, not from the general nature of all miracles, but from its own particular circumstances, becomes inconsistent with our knowledge, and incapable of being proved by any testimony whatever.

[4]"Dionysius of Halicarnassus reports that in the war between the Romans and the Latins, the Gods Castor and Pollux appeared visibly on white horses, and fought on the side of the Romans; who by their assistance gained a complete {18} victory." It is not any defect in the testimony, when applyed to the miracle, which determines us to reject it; whilst, upon the authority of the same testimony, we admit the battle and the victory: for we reject the miracle, either without enquiring at all into the testimony, by which it is supported; or, if upon enquiry, we should find few or no

objections against the testimony, yet we should still reject it. Neither can we reasonably be determined in this case by any general presumption of proof, from the nature of the thing against the existence of all miracles: for miracles have been shewn to be, in themselves, as consistent with our knowledge, and consequently as credible, as many other matters of fact. But the particular miracle in question is attended with a circumstance, which directly excludes the power of God from being concerned in the production of it. Castor and Pollux have not, that we know of, any power of changing the settled course of things: and for want of such a power in the principal agents, the fact, as it is related, is inconsistent with our knowledge, and incapable of being proved by any degree of human testimony.

The like exception runs through almost all the pagan miracles. And if in any instances we believe what is reported of their oracles; we must first have rendered these facts consistent with our knowledge, by finding out such reasons, as may persuade us, that the great deceiver of mankind, though he {19} is subject to the power of God, who can at any time say to him, -- Hitherto shalt thou go and no farther, -- hath yet a power, when he is permitted to use it, of changing the common course of things, and of producing such events, as could not have been produced by any of the visible powers of nature, which are the objects of our experience.

Many of the popish miracles are rendered incredible, in the same manner, by having some circumstance connected with them, which directly excludes the power of God. When the miracles, pretended to be wrought at the tomb of Abbe Paris, are found to have been effectually suppressed, only by walling up that part of the church, where the tomb of the saint, who was supposed to work them, was placed;[5] this circumstance cannot be reconciled with our knowledge of God's power: for his purposes, we are sure, could not have been defeated by building a wall.

Many more of these legendary miracles are attended with such circumstances, as exclude the power of God, by necessary consequence, from the production of them. When a set of men have nothing else to recommend them, besides their having devoted themselves to such a way of life, as planely defeats the end, for which they and all mankind were sent into the world, by making them always useless, and commonly burdensom to society: if they should pretend, that God interposes {20} in their favour, and works miracles to establish their credit; a better testimony, than the monks can, for the most part, produce in support of their legends, would not determine a wise man to believe them. Such an interposition would be repugnant to our knowledge of the wisdom and goodness of God, who contrives all his works with a view to the general happiness, and suffers no part of the world to be idle; but requires, as far as reason can teach us his will, that men and brutes, and creatures of what condition soever, should each, in their proper station, concur with him in labouring to promote the same important end. But where the wisdom and goodness of God are thus planely excluded, no testimony can convince us, that his power was concerned.

The truth is; if we study to avoid, as much as may be, the trouble of examining the several popish miracles distinctly, and indolently please ourselves with any thing, which promises to confute them all at once; we shall be easily led to take part with those, who under the specious pretence of defending the protestant religion, would unsettle the foundations of christianity itself, and to maintain, as they do, that there is such a proof or presumption, from the nature of the thing, against all miracles in general, as will make we know not what degree of testimony necessary to establish them. Whereas, if we would contend, as with reason we may, that the popish miracles, which {21} are best attested, are each of them connected with some such circumstances, as render it either directly, or by necessary consequence, inconsistent with our knowledge of God's power; we should then be able both to defend ourselves as protestants, and to give an answer to every one,

who shall ask us a reason of our faith in the miracles of Christ and his apostles. For enough hath, I hope, been said to make it appear; that, whatever becomes of these legendary fables, when they are confuted by arguments deduced from the particular circumstances of each of them; yet miracles, considered merely as changes in the common course of nature, are so far consistent with our knowledge of God's power, as to furnish no cause of doubt from the nature of the thing: and that consequently, when they are attended with none of those circumstances, which either directly, or by necessary consequence exclude his power; more especially if the end, proposed by them, is conformable to our notions of his wisdom and goodness; a fair testimony, though it is not a supernatural one, will be sufficient, not only to fix our assent, but to raise it likewise into assurance and confidence.

It is not my business at present to enquire what precise degree of testimony is requisite for this purpose. All that I proposed was, to bring the question concerning miracles back to the old state of it, by shewing, that there is no proof or presumption, from the general nature of such events, {22} against the existence of them. And if this hath been shewn effectually, the enquire, in which we are principally concerned, is, whether the miracles of Christ and his apostles are supported by such a testimony, as would be sufficient to establish the truth of any matter of fact, beyond all contradiction. But this question hath been so well examined, and so judiciously settled already, by much more able hands than mine; that, if either my subject would lead me, or your patience would allow me, yet their labours have rendered it needless, to spend any time in enlarging upon it.

THE END.

Remarks on an Essay concerning Miracles

Anthony Ellys

1752

Editor's note: Anthony Ellys (1690-1761) was bishop of St. David's and the author of A Plea for the Sacramental Test (1736), and the posthumous Tracts on the Liberty Spiritual and Temporal of the Protestants of England (1763-65). Although no publication date appears on Ellys's Remarks, the date of 1752 is usually assigned to it, which is consistent with the appearance of an April 1752 review of the pamphlet in the Monthly Review. Ellys begins his Remarks noting that although Hume claims to attack miracles only in profane histories, his "true Meaning was not to exempt the miracles in the holy Scriptures." Ellys believes that fear of divine punishment, and not just instinct, inclines people to be truthful in their testimonies. He finds it reasonable that Hume does not try to prove that miracles are impossible. For Ellys, experience today of unvaried laws of nature counts only against testimonies of miracles today. As to Hume's claim that natural experience opposes miracle testimonies, Ellys counters that just as the Indian prince's experience against frost does not oppose European testimonies, laws of nature do not oppose miracle testimonies. He continues that there is no joint opposition of miracle accounts in rival religions. First, God allows miracles of false religions to test the believers of true religion; and, second, rival testimonies oppose each other on a case by case basis, with the strongest testimony winning. Ellys argues that Hume's discussion of the alleged miracles of at the Abbe's tomb was meant to raise prejudices and insinuate that the Gospel miracles are on the same footing as those. The complete review of the Remarks in the Monthly Review is as follows: "The author of this small piece is both a sensible and genteel writer: he considers what mr. Hume has advanced relating to miracles in a somewhat different light from dr. Rutherforth and mr. Adams; but as mr. Adams has so ingeniously shewn the sophistry of mr. Hume's arguments, (See Review for January last) we shall not detain our readers with a particular account of what he has said" (1752, Vol. 6, p. 313). The following is from the 1752 and only edition of Ellys's Remarks.

REMARKS
ON
AN ESSAY
CONCERNING
MIRACLES,

{5}

REMARKS
ON
Mr. HUME's ESSAY
CONCERNING
MIRACLES.

MR. Hume professedly [2]"flatters himself that he has discovered an Argument, which, if just, will be an everlasting Check to all Kinds of superstitious Delusion; and consequently will be useful as long as the World lasts; for so long he presumes will the Accounts of Miracles and Prodigies be found in all Profane History." In which Declaration the two last Words may seem designed to give us the Satisfaction of Thinking, that this new Argument, great as it is to be in its Effects, yet will not extend to the Miracles related by the Sacred Writers. For if he thought it would take in them as well as others, why did he speak only of profane History, and not of History in general? His Addition of profane,

which is an Epithet of Restriction, implies an Opposition to sacred History with Regard to the Miracles which it relates, as being unconcerned in what was to be advanced. {6}

But whatever may be inferred from the Propriety of his Expression, the Author's true Meaning was not to exempt the Miracles in the holy Scriptures, any more than others, from the Force of his Argument, which is formed upon Principles that extend alike to all Miracles whatsoever; and his Conclusions from those Principles admit of no Exception. "Upon the whole," says he, "it appears that no Testimony for any Kind of Miracle can ever possibly amount to a Probability, much less to a Proof; and that even supposing it amounts to a Proof, it would be opposed by another Proof derived from the very Nature of the Fact which it would endeavour to establish." Again, "we may establish it as a Maxim, that no human Testimony can have such a Force as to prove a Miracle, and make it a just Foundation for any such System of Religion." And a little before, he had expressed himself in Terms yet stronger, but less decent where he scruples not to say, "that a Miracle supported by any human Testimony is more properly a Subject of Derision than of Argument." Accordingly, he flouts at the Miracles related by Moses in the Pentateuch; he says, "that the Christian Religion not only was at first attended with Miracles, but even at this Day cannot be believed by any reasonable Person without one;" yet the Miracles he there means were not those that are delivered to us in the holy Scripture, but some Effects on the Minds of Men, which he, in a popular Sense of the Word, is pleased to call Miracles, but which he conceives are far from according either Evidence or Credit to the Gospel.

Now as it is plain, that if this was really the Design of his Essay, it strikes at the Foundation of our Religion, by denying the Truth of all the Miracles wrought by Christ to prove that he was sent from God; it seems to be the Concern of all who believe in him, and are able to examine the Arguments of this Author, to satisfy themselves as to what there is in them. And the following Remarks, though at first designed only {7} for private Use, are now offered to the Public, because they consider this Essay in Views, somewhat different from those of the learned Persons who have answered it before, and are drawn into so small a Compass, that any Reader, without employing much Time or Pains, may be able to judge how far they answer their End.

The main Design of Mr. Hume's first Argument, is to shew that no human Testimony can be sufficient to prove the Reality of any Miracle, or make it justly Credible; in order to which, he begins with considering on what Grounds the Credibility of human Testimony itself depends. And he observes, "that our Assurance of the Truth of any Argument, founded only on human Testimony, is derived from no other Principle than our Observation of the Veracity of that Testimony in general, and of the usual Conformity of Facts to the Reports of Witnesses." And, "Did not Men's Imagination naturally follow their Memory; had they not commonly an Inclination to Truth, and a Sentiment of Probity; were they not sensible to Shame when detected in a Falsehood; were not these, I say, discovered to be Qualities inherent in human Nature, we should never repose the least Confidence in human Testimony. A Man delirious or noted for Falsehood and Vanity has no Manner of Weight or Authority with us."

It is here laid down that these Qualities and Dispositions, known to be inherent in human Nature, will cause Men to speak the Truth, unless accidental and sinister Motives hinder them from doing it. And about this, I have no Dispute with the Author: Yet must observe, that he has omitted the principal Thing that ought to have, and no doubt often has, the greatest Weight in disposing Men to speak as they think; and that is, their Sense of the Obligation which God lays them under to do it, and their Fear of Punishment from him, if they act contrary to this Obligation. Every one who reflects at all, must be sensible that God was the Author of our Faculty of Speech, and that he gave it, in order to the Benefit and Improvement that Men might receive by imparting their Thoughts and {8} Dispositions to

each other. For which Purpose, it is necessary that their Words should express their Thoughts as they really are; because if they did otherwise, their Speech would produce frequently Distrust, Ill-Will and Disturbance among them. On which Account we may justly conclude, from Reason itself, that God has strictly obliged each Person to speak the Truth; that he has given all others a Right to expect it from him; and that he himself, who always knows how far their Words are expressive of their Thoughts, will severely punish all Breaches of this Duty. This Sense of natural Obligation, attended with the Fear of Punishment from him, and of Resentment from Men, in Case of speaking falsely, I say, every one must have in some Degree: I ought to be, and must be, one of his chief Motives to say what he thinks. For this Reason, I cannot easily conceive how the Author came to omit it, and instead of it, to talk of "Men's Imagination as naturally following their Memories," which is a Thing not easy to be understood, if it be at all to the Purpose.

But, taking this Matter as the Author has put it, let us see how he proceeds upon it. He observes that

> *"as the Evidence derived from Witnesses and human Testimony is founded on past Experience, so it varies with the Experience, and is regarded as a Proof or Probability, according as the Conjunction betwixt any particular Kind of Report, and any Kind of Objects has been found to be constant or variable. There are a Number of Circumstances to be taken into Consideration in all Judgments of this Kind; and our ultimate Standard, by which we determine all Disputes that may arise concerning them, is always derived from Experience and Observation. When this Experience is not entirely uniform on any Side, it is attended with an unvariable Contrariety in our Judgments, and with the same Opposition and mutual Destruction of Argument as in every other Kind of Evidence."*

He observes farther,

> *"that many Particulars may destroy the Force of any Argument derived from human Testimony, the Character and Number of the Witnesses, the Manner of their delivering their Testimony, {9} or the Union of all these Circumstances. We entertain a Suspicion concerning any Matter of Fact, when the Witnesses contradict each other, when they are but few, or of a suspicious Character, when they have an Interest in what they affirm, when they deliver their Testimony with Doubt and Hesitation, or on the contrary with too violent Asseverations."*

But one Thing the Author distinguishes from the others, which diminish the Force of human Testimony; because it is much of the same Nature with the principal Circumstance on which his Argument against that Testimony, in the Case of Miracles, will be founded. He tells us,

> *"that when the Fact which the Testimony endeavours to establish partakes of the extraordinary and the marvellous, the Evidence resulting from the Testimony, receives a Diminution greater or less in Proportion as the Fact is more or less Unusual. The Reason why we place any Credit in Witnesses and Historians is not from any Connexion we perceive a priori betwixt Testimony and Reality, but because we are accustomed to find a Connexion betwixt them. But when the Fact attested, is such as has seldom fallen under our Observation, here is a Contest of two opposite Experiences, of which the one destroys the other as far as its Force goes, and the superior can only operate on the Mind by the Force which remains. The very same Principle of Experience which gives us a certain Degree of Assurance against the Fact which they endeavour to establish; from which Contradiction there necessarily arises a Counterpoise and mutual Destruction of Belief and Authority."*

The Reader, I fear, will begin to be tired with such long Quotations, in which but little of the Argument expected hitherto appears: And, indeed, on that Account, I thought of trying whether the Substance of these and other Observations, to the same Effect, might not be drawn into a lesser Compass. But I quitted that Design upon considering, that an Author's {10} Sense may be misrepresented or weakened by another, even without any Design to do it. On which Account those Readers who desire to form an impartial Judgment, and may not have an Opportunity to see the Author's Book, will probably chuse to have his Sentiments expressed in his own Words. I beg Leave therefore, to proceed with them, as they immediately follow those cited above, and are indeed, a proper Illustration to them.

"The Indian Prince, says our Author, who refused to believe the first Relations concerning the Effects of Frost, reasoned justly; and it naturally required very strong Testimony to engage his Assent to Facts which arose from a State of Nature with which he was unacquainted, and bore so little Analogy to those Events of which he had had constant and uniform Experience. Though they were not contrary to his Experience, they were not conformable to it."

"But in order to increase the Probability against the Testimony of Witnesses, let us suppose, that the Fact which they endeavour to establish, instead of being only Marvellous, is really Miraculous; and suppose also that the Testimony considered apart, and in itself, amounts to an entire Proof; in that Case, there is Proof against Proof, of which the strongest must prevail, but still with a Diminution of its Force in Proportion to that of its Antagonist."

And now, at length, we come to that important Argument for which all great Preparation has been made. "A Miracle," says our Author,

> *"is a Violation of the Laws of Nature; and as a firm and unalterable Experience has established those Laws, the Proof, from the very Nature of the Fact, is as entire as any Argument from Experience can possibly be imagined. There must be an uniform Experience against every miraculous Event, otherwise the Event would not merit that Appellation. And as an uniform Experience amounts to a Proof, there is here a direct and full Proof from the Nature of the {11} Fact against the Existence of any Miracle; nor can such a Proof be destroyed, or the Miracle rendered credible, but by an opposite Proof that is superior."*

In order to judge of the Force of this Argument, the first Thing to be considered is, what the Author means by saying that a firm and unalterable Experience has established the Laws of Nature. Does he mean that our constant Experience assures us what Laws are actually settled for the general Order and Government of the material World? Or does he mean that the same Experience assures us that those Laws are so absolutely fixed that they never can be suspended for any Time, or on any Occasion? His speaking of an Experience be strictly speaking unalterable, the Laws of Nature themselves must be so too, at least during our Time; and he could not well think that they are more unalterable in this Age, than they have been, and will continue to be in all others. Now if he meant that those Laws are unalterable at all Times, and could make good his Assertion, there would need no other Proof against the Possibility of Miracles. For if the Laws of Nature were unalterably fixed, the Consequence is plain, that every Miracle, which implies at least a temporary Suspension of those Laws, or an Effect contrary to them, would be impossible. But I think this can hardly be our Author's Meaning; because a Person of his Capacity must have seen that our Experience cannot be a sufficient Proof that the Laws of Nature are unalterably fixed. It does, indeed, prove that certain Laws are settled by God for the Government of the material World, and that they are highly expedient to it.

From whence it is certain that he will not alter nor break in upon them without some Reason of great Importance. But that he will never suspend those Laws on any Occasion, nor permit that any other invisible Beings should ever act so as to interrupt them in their ordinary Course, our Experience is far from being able to prove; unless it could discover that either he has made an absolute Decree against all such Proceedings, or that they must have Consequences some Way repugnant {12} to his Perfections; both which, are Discoveries that neither our Experience, nor even our Reason will ever make.

Indeed, Mr. Hume appears to have been so far sensible of this, that he does not attempt to prove directly against the Possibility of its being sufficiently proved by any human Testimony. This latter Point he knew would serve his Purpose as well as the former, and he thought it might be more easily maintained. He therefore attempts it by comparing our Experience upon which the Credibility of human Testimony depends, with an opposite Experience which he supposes us to have against Miracles; and imagining that this latter Experience is much the more uniform and constant of the two, he, according to his Rule before laid down, that in our Judgments of Things we are to be governed by our strongest Experience, determines that Miracles can never be rendered credible by any human Testimony whatever.

But in order to see the Weakness of this reasoning, let us enquire what the Author means by Experience against Miracles. The Word Experience supposes the Existence present or past, of some Facts or Events as the Objects of it; for Experience of Things that have never been, is a Contradiction in the Terms, and therefore it cannot be properly said that we have had, or can have, any Experience against Miracles. Mr. Hume perhaps will say, that an Experience of the unvaried Continuance of the Laws of Nature is, in Effect, the same Thing as an Experience against Miracles, though the latter Expression may not be quite proper. I answer, that it is not the same Thing as to the Force of his Argument; for that requires an Experience which can yield such an Evidence against Miracles as may justly be Opposed to, and in Strength will exceed the Evidence for them, which arises from the Credibility of human Testimony grounded on Experience. But our Experience of the unvaried Continuance of the Laws of Nature cannot yield any such Evidence against Miracles; for, as I have before said, it can only prove that no Miracles have been in our Time. But {13} from thence it does not follow, nor can it possibly by this Medium be proved, that no Miracles have been, or can be, at all. Now, if our Experience, with regard to Miracles, is no Proof that there cannot be any such, then this Experience can neither be superior in Strength, nor be any way Opposed, to the Experience for the Credibility of human Testimony, which affirms that there have been frequent Miracles. And if our Experience for the Credibility of human Testimony be not Exceeded, nor even Opposed by any other Experience with regard to Miracles, then, the former of these Experiences remains, in its full Strength, on Behalf of the Credibility of human Testimony with regard to Miracles. From whence it follows that when that Testimony is given by Persons fitly qualified, by their Knowledge, and their Veracity, we ought to believe it with regard to Miracles as well as to other more common Events.

Mr. Hume allows this to be true, in the Case of the Indian Prince abovementioned, with regard to the Accounts given him of the Effects of Frosts in cold Climates. That Prince might have argued against the Credibility of those Accounts, exactly as our Author does against the Credibility of Miracles. He might have alledged his own Experience, and that of all other Persons in his Country, to prove that the Fluidity of Water was a constant unvaried Phaenomenon or Law of Nature. It had never been known to become a solid Body, on which Men, unsupported by any thing else, might walk without sinking; nor did it seem capable of becoming such a one. Now this their constant Experience about it, was of much greater Force to prove that it never could become solid, than any human Testimony, the

Credibility of which is grounded on a lesser Experience, could be to prove that it ever had been solid: And therefore, this Prince, according to Mr. Hume's Way of Reasoning, might have justly refused to believe that Water had ever been actually frozen into a solid Body, though this Fact had been affirmed to him by any Persons, however numerous, or however great seeming Probity. {14}

Yet this Author intimates plainly enough, that very strong Testimony might justly have engaged the Prince's Assent to these Accounts of the Effects of Frost: For though they were not conformable to his Experience, yet they were not contrary to it. The last Expression, as it came from Mr. Hume, has, indeed, a little different Turn, but is, in effect, the same with this. And his Observation is certainly right; for the Prince neither had had, nor could have, any Experience that Water could not be frozen to Solidity. All that his Experience amounted to, was, that Water had never been actually solid, within his Knowledge or Observation; but this was no Proof from Experience that it could not ever have been so. There was no Experience in this Case that could be Opposed to the Experience for the Credibility of human Testimony. And therefore such Testimony, when strong, as it ought to be, in Proportion to the extraordinary Nature of the Fact related, must have remained in its full genuine Force, and was therefore justly credible, and capable of rendering the Fact related credible to the Prince. Now as Mr. Hume saw the Justness of this Reasoning in the Case before us, so he ought to have seen it, with regard to the Credibility of Miracles upon sufficient human Testimony. For the Reasoning is exactly the same in both. There is no more Experience to any one against Miracles, than there was to the Indian Prince against the Effects of Frost. And since there is no such Experience to be Opposed to that Experience, upon which the Credibility of human Testimony is grounded, that Testimony ought to have its full Force in the Proof of Miracles, as well as of any other Events.

Having made these Remarks upon the only Argument which Mr. Hume has urged against Miracles in the first Part of his Essay, I proceed to the second, in which we meet with another Argument of the like Kind, in the following Words:

> *"There is no Testimony," says he, Page 190, for any Prodigies, even those which have not been expressly detected that is not opposed by an infinite Number of Witnesses; so that not only the Miracle destroys the Credit of the Testimony, but even the Testimony destroys itself. To make this the better understood, let us {15} consider that in Matters of Religion whatever is different is contrary, and that it is impossible that the Religions of ancient Rome, of Turkey, or Siam, and of China should all of them be established on any solid Foundation; every Miracle therefore pretended to have been wrought in any of these Religions, (and all of them abound in Miracles) as its direct Scope, is to establish the particular System to which it is attributed, so it has the same Force, though more indirectly, to overthrow every other System; in destroying a rival System, it likewise destroys the Credit of those Miracles on which that System was established; so that all the Prodigies of different Religions are to be considered as contrary Facts, and the Evidences of these Prodigies whether weak or strong, as opposite to each other. According to his Method of reasoning, when we believe any Miracle of Mohamet or any of his Successors, we have for our Warrant the Testimony of a few barbarous Arabians, and on the other Side, we are to regard the Authority of Titus Livius, Plutarch, Tacitus, and in short, of all the Authors and Witnesses Grecian, Chinese, and Roman-Catholick, who have related any Miracle in their particular Religion, I say, we are to regard their Testimony in the same Light as if they had mentioned that Mahometan Miracle, and had in express Terms contradicted it with the same Certainty as they have for the Miracles they relate. This Argument may appear over subtle and refined; but it is not in Reality different from the*

> *reasoning of a Judge, who supposes that the Credit of two Witnesses maintaining a Crime against any one, is destroyed by the Testimony of two others who affirm him to have been two hundred Leagues distant at the same instant when the Crime is said to have been committed."*

At the Beginning of this Argument there are some Propositions about which I shall not dispute with the Author: They are, First, That in Religion whatever is different is contrary, and that, therefore no two opposite Religions can be both of them true. Secondly, That every Miracle wrought in Support of any Religion, not only tends directly to prove the {16} Truth of that Religion, but also tends though more indirectly, to disprove all other Religions. Thirdly, That every Miracle, while it tends to disprove the Truth of any different Religion, does likewise disprove the Truth of all the Miracles pretended to have been wrought on Behalf of that Religion. The last of these Propositions indeed, ought not to have been advanced without some Proof; for the Author must have known that both the Jewish and Christian Religions[3] suppose that some Miracles have been, and may be wrought in Religions opposite to them; and of consequence, must suppose, that their own Miracles do not effectually disprove the Reality of those other Miracles. The Reasons they give why God sometimes permits Miracles to be wrought in false Religions, are, that he does it to try the good dispositions of Men in the true one, and to put them upon a more careful Examination of the Nature and external Evidences of it; which Reasons this Author would not have been able to confute; and on that Account, perhaps has declined to consider them, as he likewise has forborne attempting to prove that all Miracles in opposite Religions are incompatible with each other; though this is the necessary foundation upon which his present Argument is raised, and without it, must immediately fall to the Ground.

However, that we may see what a Structure he can make if this Foundation be allowed, let us pass over his third Proposition as well as the two former without any Dispute. Now his reasoning from them is to this Effect: Because the Testimony for the Miracles in any Religion tends to disprove, as far as it can, all the Testimonies for the Miracles in every one of the different Religions, the Consequence is, that the Testimony in Behalf of the Miracles in every particular Religion is opposed by an infinite Number of Witnesses, whose Testimony being very much stronger than the Testimony for the Miracles in any such particular Religion can be; on this Account, no Testimony of this Kind can ever make the Miracles pretended to have been wrought in any such Religion be justly credible. {17} To illustrate this Doctrine, our Author supposes us to have an Account of a Miracle performed by Mahomet, or one of his Successors; and that for our Warrant in believing it, we have the Testimony of a few barbarous Arabians; while, on the other Hand, we have, against it, the Authority of Titus Livius, Plutarch, Tacitus, and in short, of all the Authors and Witnesses, Grecian, Chinese, and Roman Catholic, who have related any Miracle in their particular Religion: For the Testimony of all these, "must be regarded," says he, "in the same Light, as if they had mentioned that Mahometan Miracle, and had in express Terms, contradicted it, with the same Certainty, as they have for the Miracle they relate."

These Suppositions and Assertions may, at first Sight, appear very unaccountable: For how can Livy, Plutarch or Tacitus be regarded as Witnesses against a Mahometan Miracle, which, if such a one had ever been, could not have been wrought till some hundreds of Years after they all were dead? Or how can even the Grecians, the Chinese, or Roman Catholics be considered as giving Testimony against the same Miracle, of which our Author does not seem to suppose that they had ever known or heard any Thing at all? But in order to do him Justice, the Reader must observe, that all these Persons are, and great Numbers of others might have been alledged as Witnesses against it, in Consequence of his Reasoning here before mentioned; which is, that because no two Miracles in different Religions can, both of them be true; therefore, the Testimony of the Grecians, the Chinese, and all the rest, for the

Miracles, in their several Religions, must really opposed, and, as far as the Strength of their Evidence will go, must tend to disprove the Testimony of the Mahometans for the Miracle pretended to be wrought in Behalf of their Religion. And, indeed, since this Reasoning proceeds upon the Author's third Proposition at the Beginning of this Argument, which I have passed over without disputing it, I am now obliged to allow the Reasoning to be so far conclusive as it aims at proving that the Testimony in every particular Religion, the Mahometan for Instance, is virtually opposed by the Testimony for the {18} Miracles in all other Religions, whether these latter Witnesses ever knew any Thing against the Mahometan Testimony or not.

But such a merely consequential Opposition of all the Testimonies for the Miracles in all the different Religions, will not be sufficient for our Author's Purpose of disproving the Mahometan Miracle. He must go somewhat further, and shew, either, first, that some one of the opposite Testimonies is really, in itself, stronger than what there is for the Mahometan Miracle: Or, secondly, that since all these several Testimonies, are alike virtually opposite to the Testimony for that Miracle, there may, by an Alliance or Union of them, be a Testimony formed against it, of much greater Strength than its Testimony has; and which, therefore, will destroy the Credibility of it.

Our Author seems to have declined insisting on the former of these Points; because though he might have shewn in some one of the Regions opposite to the Mahometan, a Miracle that had a Testimony for it stronger than this has; yet he might not be able to shew so much in the Case of another Religion which seems to have been chiefly in his View, though he would not here mention it. He could hardly hope to find in any of the Religions opposite to this latter, a Testimony superior to that by which a very remarkable Miracle in it is supported. And therefore he chose a Way of arguing that he thought would not fail to prove as well against this Religion, as against the Mahometan, and, indeed, would prove, in general, against all the pretended to be grounded on divine Revelation. To this End, he had Recourse to that infinite Number of Witnesses which might be drawn together from all the Religions opposite to the Mahometan, or to any other that he should have a Mind to disprove; in order, from this Collection of them, to make up a united or aggregate Testimony that should be plainly superior in Strength to any Testimony that could ever be alledged from the Miracles in any single Religion. {19}

But however plausible this Scheme may have appeared to Mr. Hume, it is nothing but a Fallacy, and can have no Effect. We shall plainly see this, if we consider that, supposing, a Miracle related to us has been possible in itself, the Credibility of the Persons by whom it is attested, must always depend, on the Opportunities they have had to know the Nature and Circumstances of the Fact; on their Abilities to judge well of it; on their Character for Veracity, in declaring exactly whatever they know or believe about it; and on their Number and Agreement with each other. In Proportion as these Circumstances appear to have been more or less in their Case, they will be more or less credible. But whatever the Degree of their Credibility is, common Sense plainly dictates that it must depend solely upon themselves, and cannot be either increased or diminished by the Testimony of any other Persons who have never known or heard of the Miracle in Question, but only attest some other Miracles different in all Respects from this. The Credibility of the Persons who relate a Miracle supposed to have been done in China, can neither be impaired, nor can it be increased, by the Credibility of any other Persons who relate a Miracle done in Italy. As each of these Credibilities has been derived merely from the Circumstances and Dispositions peculiar to the Persons concerned in each Testimony, and who on either Side are supposed to be quite Strangers to the others, and to the Fact attested by them, it is therefore, impossible that either of these Credibilities can be rendered greater, than it is in itself, by any Conjunction it can have with the other. For no Man can imagine that personal Circumstances, Abilities, and Dispositions can be transferred, or in any Degree imparted

from the one Set of these distant Witnesses to the other. You might well think of adding to the Number, by putting Cyphers to the left of it, or of lengthening a Line, by adding a Sound or a Colour to it, as of increasing the Credibility of the Chinese Witness, by adding the Credibility of the Italians to it. {20}

Which Consideration plainly shews, that though indeed the Testimonies for both these Miracles may be, in one Respect, opposed to the Testimony for the Mahometan Miracle; yet neither of those former Testimonies can ever receive, except in one Case only, any increase of its Credibility from the other of them, so as that both will, on that Account, become more credible, in Opposition to the Mahometan, than either of them would have been alone. The case that I except is, when any of the Witnesses for each of these two opposite Miracles are supposed to have known Circumstances of the same, or a like Nature, that concern the Mahometan, or the Witnesses to it; and tend to detract form the Credibility of either of them. In that Case, indeed, the Credibility of each of these two Sets of opposite Witnesses would be increased by the Addition of the other, considered as being opposed, in Conjunction with it, to the Testimony for the Mahometan Miracle: And the Credibility of this latter would be impaired more by such an Alliance or Union of those Testimonies, than by either of them singly, in Opposition to it: And so, more still, in Proportion, if there were a greater Number of Testimonies, of this Nature, against it.

But if no one of the opposite Witnesses declares any Thing, in particular, against the Credibility of the Mahometan Miracle, or appears to know any Thing of it, or of the Witnesses on its behalf; in this Case, how many soever these opposite Witnesses may be, their Number will avail nothing against it; in Regard that their Testimonies can not be united, nor their Credibility by that means, be increased. They can only act by the single Weight of each, compared, as to its Credibility, with the Testimony for that Mahometan Miracle. Upon which Comparison, indeed, any one of them that is found its superior in Credibility, will prevail and disprove it. But in doing this, it can receive no Advantage from the infinite Number of the Witnesses that, merely by Virtue of our Author's Reasoning, are joined with it in a virtual Opposition to that Miracle: For a Conjunction of this Sort can have no Effect at all, either upon the Credibility {21} of the several Testimonies so drawn together, or on that of the Mahometan Miracle whose Testimony they oppose.

It is evident, therefore, that this supposed infinite Number of Witnesses, raised by Mr. Hume, in Opposition to that Miracle, and by a Parity of Reason, to any other which he intends to disprove, is mere Amusement. Whatever Witnesses there are who really know any Thing against such a one, they would be of as much Force as they can ever be, without this consequential joint Opposition; and those that know nothing of this Miracle will do it no harm, however, great Numbers of them may be brought to make their Appearance for that Purpose. They are like separate Parties of Troops which make a great Shew in the Field of Battle, by appearing all on the same Side; but can never be drawn into one Body, nor made to charge the Enemy together, but act singly by themselves, with only their own unassisted Force; and therefore, if each of them be weaker than the Enemy, there can be no Prospect that they will ever prevail. But quitting this Simile, and the Argument itself, which I hope has been set in its proper Light; I only beg leave, on this Occasion, to make one general Remark: It is, that the Interests of Truth and Virtue, which undoubtedly are the most valuable Blessings in human Life, would be in a much better State that they are, if Men of Letters would be more cautious how they lay a Stress upon novel Arguments of their own Growth, against any Points of Moment in Religion; and especially how they, by making them public, throw them into the Hands of Persons of all Ranks, who are Dabblers in Reading. There are, in the present Age, great Numbers of People who answer to the Character given by St. Paul,[4] 2 Timothy 3:7. That they are ever Learning, and never able to come to

the Knowledge of the Truth; because indeed they are not disposed[5] to receive {22} it. These Persons are always ready to be taken by any new Conceit, especially if it be to the Disadvantage of Religion. But to consider, with proper Care, what is said in answer to such Objections, is a Talk for which they seldom have any Inclination, or at least not enough to make them go through with it; and so, the ill Impressions they have received continue upon them: Their Faith is subverted, and their Morals often ruined in consequence of it.

This was an Effect that generally followed upon the sceptical Discourses of some Philosophers among the Greeks, in Opposition to the great Principles of Religion and Morality. Socrates[6] observed it with very much Concern; and accordingly declared, that every one ought to be extremely cautious how he treated Points of such high Importance, especially in publick. And he himself gave an Example of it, expressing great Diffidence of his own Abilities when he was to speak of the chief Good,[7] of the Nature of the supreme Being, or of any other such Subjects. And in Pursuance of his Advice, one of his Friends, before he entered on a Discourse of this Nature, expressed himself in these following Terms. [Greek quote][8] Plat. in Timae, p. 1059. If some of our modern Authors had taken a Course like this, before they fate themselves to write or publish their Thoughts upon Matters of Religion, the World perhaps would not have been troubled with so many of their crude and false Notions; which, though sufficiently answered, have yet had a pernicious Effect in corrupting the Principles and Morals of our Nation. {23} But be Good Men, will easily learn the Way to be so. One sees how agreeable this Observation, made by two of the greatest Men among the antient Heathens, is to what was delivered afterwards by the highest Authority, John 7:17. If any Man will do His [God's] Will, he shall know of the Doctrine, whether it be of God, or whether I speak of myself.

But to return from this Digression to Mr. Hume and his Essay, I have considered all that Part of it which contains any Argument; the rest of it consists either of Assertions destitute of Proofs, or of Observations from which nothing can be justly concluded, and which tend to nothing but to raise undue Prejudices in the Minds of weak Readers. Of this latter Kind are our Author's Observations. He acquaints us in a great Number of Words, that Men are generally apt to be pleased at hearing extraordinary and wonderful Things; that some may be Enthusiasts; others may think they do right in telling Lies for the Advantage of their Religion; Vanity and Interest may be to others, their Motives for endeavouring its Propagation; they may be encouraged in attempting to do it be the Credulity and Weakness of those Persons to whom they apply. That if they have Eloquence, Craft and Address, they may be likely to work upon illiterate and barbarous People, as Lucian's Alexander did on the Paphlagonians. That Accounts of Miracles have chiefly abounded among ignorant and barbarous Nations, and after they have received there for some Time, it has been difficult to detect the Falsity of them; that Men are disposed to say Things, which tend to the Honour of their own Country or Families; that if they have Opportunities, they may easily be tempted to assume the high Character of Missionaries from Heaven; and when they have done so, may bear many Distresses in order to maintain it.

Most of these Observations, may in some Cases, have been true. But what just Consequences can be drawn from them against the Credibility of all human Testimony when alledged in Proof of Miracles? If some Men be weak or ill-disposed, must all therefore be so? Were there never any Men of good Sense or Probity? Is there not very great Reason to believe that some such there have been in every Age, as there are in the present? Have not indisputable Proofs been given by Witnesses, in some Cases, of their Integrity, their good Judgment, and their perfect Knowledge of the Things they related? If these Facts are beyond Question, what Advantage {24} can our Author gain, by observing that there have also been great Numbers of Knaves and Fools in the World? His Design is to insinuate, that the

Witnesses to all the Religions that have pretended to be divine Revelations, were Persons of one or other of the last mentioned Characters. But every Eye must be able to discern that there is not the least Consequence in this Sort of Reasoning, which really does not deserve that Name.

And this Author's Assertions are not better grounded. He affirms, "that there is not to be found in all History, any Miracle attested by a sufficient Number of Men, and with such other Circumstances as are requisite to give us a full Assurance of the Truth of their Testimony." This is an Assertion which is hardly capable of a due Proof. For in order to a compleat one, this Author is obliged to consider and disprove all the several Evidences that have ever been given for all the Miracles of which we have any Account And this, I think, he has hardly yet done, or is likely to do soon. At least in this Essay, he has not attempted any Thing material to this Purpose. His Assertion remains entirely unproved, and therefore, cannot, with Reason, be allowed any Weight.

However, as it is an express Declaration of his own Opinion about the Testimony for all Miracles, which, without any Exception, he reckons insufficient to prove, or render them credible; we may from thence be led to ask, For what Purpose he has mentioned the Miracle related by Tacitus, as having been wrought by the elder Vespasian; or the marvellous Creation of a new Leg, to a Man at Saragossa, by the Use of the holy Oil; of the numerous Miracles ascribed by the French Jansenists to their Abbe Paris? Since he plainly looked upon all these, as false Stories and Impostures, why did he trouble his Readers with Accounts of them? I must be so free as to tell Mr. Hume, that the Respect due to Mankind, and much more to GOD and his sacred Truth, ought to hinder an Author from publishing any Thing, especially on Subjects that concerns Religion, but what he either knows, or on reasonable Grounds, believes to be true. He ought {25} not to make Use of that very unfair, though sometimes indeed too effectual Method, of raising Prejudices in weak Minds, against a Thing which cannot, by Reason, be confuted. If he thinks that the Testimony given for the Mosaic or the Christian Miracles is not sufficient to satisfy any reasonable Man, let him endeavour to disprove both it and them. To those Objections which he has raised against the History of Moses, let him add what others he can find or Form of a more solid Kind. But let him not take the low Way of insinuating, quite without Proof, that the Evidence for the Miracles of Moses and of Christ is not at all better than what has been given for those other Miracles that he has mentioned; which is plainly his Design in relating, with such an Air as he does, those notable Stories. There is no Sort of Reasoning, or Justness of Consequence in such Comparisons or Insinuations. They tend only to raise Prejudices against the Truth, and to throw discolouring Lights upon it. They are therefore, unworthy of any Man who pretends to Religion, or even to ordinary Probity and Candour.

Which Censure I must, with Concern, affirm, is yet more due to that Treatment almost beyond Parallel, which is given, soon after, more openly, by this Author, to the Christian Religion and to all who believe it. He briefly resumes the Arguments, by which he has attempted to prove, that "no Evidence for any Miracle can amount to a Probability, much less to a Proof; and that, even supposing it amounted to a Proof, it would be opposed by another Proof derived from the very Nature of the Fact, which it would endeavour to establish, &c." After which, he insists on his Conclusion, and even establishes it as a Maxim, that no human Testimony can have such Force as to prove a Miracle, and make it a just Foundation for any System of Religion, And "he is the better pleased," he says, "with his own Reasoning, as he thinks it may serve to confound those dangerous Friends or disguised Enemies to the Christian Religion who have undertaken to defend it by the Principles of human Reason." He himself affirms, "that our most holy Religion is founded in Faith, not in Reason, and that it is a sure Method of exposing it, to put it to such a Trial as it is by no Means fitted {26} to endure." His Meaning is, that they will indeed effectually expose it who aim at proving, by the Means

of credible Testimony, that the Miracles said to have been wrought on its Behalf, were rational and sufficient Proofs that it came from God. For that, he pretends, is a Thing to be received by Faith alone, without any Proof or Reason whatsoever.

Yet presently afterwards, this Author Affirms, "that the Christian Religion was not only at first attended with Miracles, but even at this Day cannot be believed by any reasonable Person without one. Mere Reason is insufficient to convince us of its Veracity; and whosoever is moved by Faith, to assent to it, is conscious of a continued Miracle in his own Person." Does there no appear to be some Inconsistency in these Declarations? No. He represents very plainly, all those who at first embraced what he calls, with a Sneer, our most holy Religion, or who now believe it, since they must do it entirely without Reason, "to have subverted all the Principles of their Understanding," and says, "that by believing what is most contrary to Custom and Experience, they are Instances of Miracles in their own Persons." Now what other Miracles could he think these to be, after what he has said through the whole Course of this Essay, but prodigious Effects of Credulity and Folly?

These last indeed, are not his Words; but that they express his real Sense, an impartial Reader will easily perceive: And when such a one considers by WHOM, in this Nation, the Christian Religion is publickly established, as well as professed, he will know what to think of an Author, who could treat THEM in such a Manner; and make such an Use of the valuable Liberty they are pleased to allow Men of publishing their Thoughts on Religion itself, as well as on all other Matters of Importance. He will not think it strange if a Person so disposed, should not be affected either with the Doctrines of the Christian Religion, or the Evidences for it. Nor if another, to whom the Promises of the Gospel are Objects of very pleasing Hopes, should have shewn some Concern for its Vindication, when it has received such unworthy Treatment.

Some Late Opinions Concerning The Foundation Of Morality, Examined. In A Letter To A Friend.

1753

Editor's note: *Some Late Opinions* pamphlet appeared anonymously in 1753; this and James Balfour's *A Delineation* (1753) are the first published discussion of Hume's *Enquiry Concerning the Principles of Morality* (1751). After brief introductory comments, pages 7-12 focus on Lord Kames's, *Essays on the principles of morality and natural religion* (1751) and pages 13-46 on Hume's moral *Enquiry*. The author expresses general approval of Kames's account of morality, but criticizes Kames for identifying obligation with an approving sentiment. Hume's theory is found less favorable and is criticized for the central role that utility plays, particularly when issues of justice are taken into account. William Rose's complete review of this pamphlet in the *Monthly Review* is as follows:

> **THIS letter, which is written in a genteel and sensible manner, contains some general observations on two books lately published; the one entitled, *Essays on the principles of morality and natural religion,* by an anonymous author; the other *An Enquiry concerning the principles of morals* by *David Hume,* esq; The first of these performances our letter-writer is, in general, highly pleased with, and thinks the author of it has great merit, were it only for stating so clearly the sentiment of duty, or moral obligation, and distinguishing it from the sentiment of simple moral approbation; the want of which distinction, he says, has always appeared to him a great defect in former authors, who acknowledged an internal sense to be the foundation of morality.**
>
> **As to the *Enquiry into the principles of morals,* he allows that the author is a very agreeable writer, and discovers an uncommon genius, but thinks that the love of simplicity has betray'd him, as it has many before him, into considerable errors. He examines a little mr. *Hume*'s doctrine in regard to justice, and endeavours to shew that the arguments advanced in support of it are altogether inconclusive. After this he proceeds to consider that idea of approbation, which mr. *Hume* makes to include the**

whole of the moral feeling, and upon which he founds the distinction betwixt virtue and vice; and here he takes a short view of that variety of different objects and qualities, which the author of the *Enquiry* ranks under the same class of moral approbation; and endeavours to shew, that the sentiments they produce in us differ as widely as the approbation of inanimate from that of rational objects.

He observes that morality can be founded and ascertained on our innate feelings of duty alone, and the authority which conscience carries in it, and that the overlooking these is an error which runs through the whole of the *Enquiry*. [*Monthly Review*, 1753, Vol. 8, p. 400.]

The following is from the 1753 and only edition of *Some Late Opinions*.

SOME LATE OPINIONS Concerning the FOUNDATION OF MORALITY, EXAMINED. In a LETTER to a FRIEND.

LONDON:
Printed for R. DODSLEY, in Pall-Mall; and M. COOPER, in Pater-Noster-Row.
MDCCLIII.

Advertisement.

IN the present indolent state of learning, when writing goes on without labour, and reading without profit, a new species of composition has become fashionable; which, not being honoured with a peculiar name, borrows from it's form the appellation of A letter to a friend. -- A happy invention for writers, who have not courage to undertake a regular work. One of this sort, when seized by a fond fit of ambition to become an author, has as an easy passage to fame by a familiar address to the public, under the character of an intimate acquaintance. {iv} Probably the following letter will be considered as a work of this kind; and, but for one reason, the mistake should pass,

for there is no harm in it. The reason is, that the Person, to whom the letter was really addressed, reckoned himself so much indebted to the writer, that he could not deny himself the satisfaction of making a sort of public acknowledgement. And he was the more readily induced to do this, because the loss of so valuable a friend has not left him no other means to testify his gratitude.

{5}

SOME LATE OPINIONS Concerning the FOUNDATION OF MORALITY, EXAMINED.

In a LETTER to a FRIEND.

SIR,

THE turn you have taken of late to moral speculations gives pleasure to your friends. You certainly cannot employ your present retirement better, than in such studies as have a direct reference to human nature, and to the conduct of life. Morality, as you well observe, justly lays claim to {6} the first place among the sciences, because of the importance of its end, which is, to regulate our behaviour. And therefore it concerns mankind to have the principles of this science, above all others, established in a satisfactory manner; and to have the consequences of these principles deduced with clearness and accuracy. In may other parts of knowledge we may be mistaken, without any considerable prejudice to ourselves: but in moral systems, any error, at least any capital error, ought not to be regarded with indifference; because it may draw consequences after it affecting the conduct of life. The accurate examination which, upon this account, you propose of the theories of morality advanced by several authors, I very much approve of: and as you are pleased to think I can be of service to you in this examination, you may be assured I shall not decline giving you any assistance that is in my power. It is what I owe to the memory of your father, and it is {7} what I cannot deny to the goodness of your own disposition, had I no other motive.

Two books you Particularly mention lately published, which, by their singularity and novelty, have engaged your attention; the one entitled, *Essays on the principles of Morality and natural Religion, in two parts; by an anonymous author:* the other, *An Enquiry concerning the principles of Morals*, by David Hume *Esq*. I have read both with care; and shall communicate to you the observations I have made.

To begin with the former. The author has discovered a bold and penetrating genius; and has advanced many things new and curious. In some points I cannot agree with him. His speculations concerning liberty and necessity, in particular, are liable, in my opinion, to several strong objections. But this is what I shall not at present inquire into, {8} as it is only his treatise concerning the law of nature, and the foundation of virtue, which I now mean to consider. And here I must confess he has afforded me a great deal of entertainment. Though he has not writ a professed system, yet he has given more openings into the subject, and has set it in a juster light than any other author I know. He traces the several feelings of human nature which relate to morality, and ascertains their different degrees of authority. In my opinion his merit is great, were it only for stating so clearly the sentiment of duty, or moral obligation; and distinguishing it from

the sentiment of simple moral approbation. The want of this distinction appeared always to me a great defect in former authors, who acknowledged an internal sense to be the foundation of morality. In benevolence they comprise the whole of virtue; and, confounding obligation with a mere approbatory sentiment, they suppose mankind to be under the strictest obligation {9} to the highest acts of benevolence; because such actions produce the highest approbation. In this, their systems have the misfortune to contradict nature and experience; and therefore have undoubtedly a dangerous tendency. For no man, after he is dismissed from the schools of philosophy, and begins to act his part in life, can in any degree act upon such a plan as these philosophers lay down; and hence is too apt to consider the whole of virtue as a romance or chimera. He will indeed feel himself inwardly bound to a strict observance of the rules of justice and honesty; but will never be conscious of a perpetual obligation to exert, on every occasion, the highest acts of generosity and benevolence. Here then our author makes a distinction which is certainly founded in nature and truth; and which serves no a little to illustrate the wisdom of the human constitution. He observes, that indeed the highest approbatory pleasure attends generous and benevolent {10} actions; but that as justice, truth, fidelity and gratitude are more necessary to the support of human society; so, to these virtues only belongs the sentiment of strict moral obligation. The peculiarity of this sentiment, as expressed by the words, *ought* and *should*, our author distinctly explains, and shews how it is to be distinguished from simple approbation by the sanction of self-condemnation and remorse.

As this author has thus analysed the moral sense to better purpose, in my judgment, than had been done before him; so, in treating of our principles of action, he has thrown new light upon the affection of universal benevolence. He has very justly observed, that though there are principles in our nature exciting us to compassion, to gratitude and to friendship; yet, where there are no circumstances to awaken or engage the mind, we rest in a state of indifference, and are not conscious either of benevolence {11} or malevolence to an unknown person. The moralist, therefore, who requires us to lay aside all partial affection, and to act upon a principle of general benevolence to all men, require us to act upon a principle which, in truth, has no place in human nature. Providence has more wisely contrived it, that though our benevolence to individuals gradually decreases according to their distance, 'till at last it dwindles away to nothing, yet, when these individuals are collected into one body, and considered as a general object, benevolence rekindles towards them in the highest degree; and our country, our government, or mankind in general, are objects capable of raising the warmest feelings of zeal or public spirit. The attention which our author has shewn to trace the final causes of this and the other phaenomena which he points out in human nature, recommends his speculations to me the more, as tending to confirm and promote an admiration {12} of nature and providence; and end which it is highly worthy of every philosopher to keep in view, if he expects that mankind should be made truly better by any of his speculations. The delineation which the author has given of the laws of nature, I cannot but think extremely consonant to the natural feelings and sentiments of men. But it is needless to insist any longer upon this treatise, as there does not seem to be any difference of opinion betwixt us about it: and I entirely agree with you, that it is worthy of your repeated perusal.

To proceed then to the *Enquiry into the principles of morals*; I am of the same mind with you, that the author is a very agreeable writer, and discovers an uncommon genius. You seem pleased with him for having reduced the system of morals into a narrow compass, by resolving the whole into a single principle. But here we must differ; for I am afraid, the love of simplicity has betrayed him, {13} as it has many before him, into considerable errors. Patiently to investigate facts is doing a

great deal; and very often is all that can be done: But to build systems, and to trace first principles, is too much for us to attempt in most sciences; and the appetite for it commonly diverts the mind from the fair and unbiassed view of facts. Let us examine a little how this author has succeeded in some of the chief parts of his theory.

Utility is his favourite and capital principle, to which he reduces all the several branches of morals. With regard to benevolence, he admits of a moral sense which may produce an immediate and instinctive approbation of it; but with regard to justice, his notions are very singular. He denies that we have any natural sense or approbation of justice: he asserts it to be an artificial virtue, of which public utility is the sole foundation: and a great part of his treatise is employed in proving this. {14} This part of his doctrine I see has staggered you, nor without reason; for to me it appears not only ill founded, but even of dangerous tendency; and it puts justice, which of all virtues is the most necessary and fundamental to society, on a more loose and precarious bottom than the rest; and somehow degrades it into a lower class, and distinguishes it in a dishonourable manner. The author, of whom we were treating before, has a whole chapter upon this subject, in his essay on the laws of nature; in which, I think, he has clearly proved, that justice has a deeper foundation in our nature than mere reflexion on its utility. I confess it surprises me how a philosopher, who admits of a natural and immediate approbation as belonging to any virtue, should refuse this privilege to justice. For to me it seems clear, that no sentiment, no instinct, is so early observed in children, and so universally prevalent among all nations, even the most savage, as a notion of {15} property, a sense of right and wrong, of just and unjust. Perhaps there is no moral feeling whatever that is more clearly marked, that works stronger in the human breast, or that arises more instantaneously than indignation at injury and wrong; a feeling which is plainly natural, and by no means the consequence of any reflexions upon a public interest. Were this sentiment built only upon views of public utility, as our author contends that it is, there could never prevail among mankind so much uniformity of opinion concerning right and wrong. The varying views of utility, produced by the partialities of men for themselves, their relations, friends, country, &c. would be ever varying men's sentiments of justice, according to the different circumstances of the parties concerned. Of these inherent partialities and prejudices no education or enlarged views would ever wholly get the better. Or, supposing them to be, in some cases, overcome by reason, {16} the matter would not be much altered, considering the small number of men so happily disciplined. So that, if usefulness were the only foundation and measure of justice, the rules of right and wrong would be perpetually shifting, according to men's different apprehensions of a public interest. Nor is it here to be overlooked, that many cases occur in life, in which the consideration of a public interest loses its whole force, in restraining men from injustice; particularly with regard to secret transactions. Suppose me, for instance, privately trusted by a friend with some of his most valuable effects; he dies suddenly, leaving an overgrown fortune to his heir, who is a miser or a prodigal I have a numerous family, hopeful children, upon whom my deceased friend's effects would be bestowed much more for the public good, than upon his heir who, knowing nothing of this matter, suffers nothing. Every argument, that can be drawn from utility, {17} seems here to justify me in retaining these effects, by which I shall be enabled to give my children a virtuous education and a creditable establishment. Here utility unluckily takes the wrong side; and if, even this singular case, the duty of restitution and fulfilling a trust continues rigidly the same as in ordinary cases, of which no honest man will doubt, it follows evidently, that justice must rest upon some foundation independent of utility.

As it is a very material point, in any system of morals, to ascertain the foundation of justice; let us

follow our author a little, and see what are the arguments he advances in support of his hypothesis. I cannot help thinking they are altogether inconclusive. He argues from the supposition of a golden age, where all the conveniencies of life are in perfect abundance, without need of any labour to procure them; and where the minds of men are animated with {18} perfect friendship and generosity to each other. "Suppose such a state," says he[2], "and it would follow, that men could not have the least idea of justice or separate property:" From whence he infers, that this virtue derives its existence altogether from its use in the present intercourses of mankind. This is a very lame conclusion; for his argument proves no more than, that certain circumstances are requisite in order to give the natural sentiment of justice an opportunity of displaying itself. "Reverse," says our author,[3] "in any considerable circumstance, the condition of man: produce extreme abundance or extreme necessity: implant in the human breast moderation and equity, or perfect rapaciousness and malice: by rendring justice totally useless, you thereby totally destroy its essence, and suspend its obligation upon mankind." That is, suppose man no longer to be man; endow him with another nature; place {19} him in another world; suppose him no more subject to the same wants and necessities he is now subject to: and what follows? Why, no doubt, that, upon such a supposition, several of his present feelings and sentiments would become useless, and have no place. But will any man draw this consequence, that therefore these feelings and sentiments are not natural to him? Upon the same chimerical supposition of a perfect state, neither would there be any place for some exercises of benevolence, such as compassion; seeing there would be no objects of distress. And yet compassion, according to our author's express doctrine, is among those principles which are natural to man. The same argument holds for justice. "But," says he, "in some cases which actually happen in life, such as that of famine, or a besieged city, the distinctions of property are overthrown, and the obligation to justice ceases." And what does this prove, but that, in certain cases {20} of extremity, the great law of self-preservation takes place of all other principles whatever; which all moralists have allowed. It is most true, as our author observes, that the laws, which direct the exercise of justice, have always public good for their object; *salus populi suprema lex*. This, no doubt, shews, that justice and public good coincide; but will never prove, that we have no sentiment of justice but what arises from a reflection on public good. For so likewise public good directs and limits the exertions of private friendship and benevolence; whilst yet, according to our author's own theory, these virtues have a separate and independent foundation in the nature of man. Why then should we deny the same foundation to justice, when public good has no more authority over the exercise of the one than over the exercise of the other?

Our author is so unlucky in his arguments, the he makes use of one which {21} turns, in my opinion, directly against him. It is in his second Appendix; where, professedly supporting his hypothesis concerning justice[4], he bestows a great deal of illustration to shew, That every single act of benevolence carries in it a manifest character of utility, or tendency to public good: That this tendency, however, is far from being so manifest in every single act of justice or fidelity: but, That, here, the benefit to the public arises from the general observation of the rules of justice, as a scheme concurred in by the whole society: and he adds, That particular acts of justice may, sometimes, be attended with such apparent inconveniencies and evils, as may lead a young inexperienced mind (as in the case of *Cyrus*, which he instances) to decide in favour of what is unjust, under the notion of its being better for the public. Now, if this be the case, as plainly it is, this alone clearly shews, That justice {22} can never be an artificial virtue, formed only on a sense of public interest: for this public interest, to which it is supposed to be subservient, is, by the author's own reasoning, an object so much out of view, as to be quite insufficient for supporting

that general sense of justice, which we find prevailing in the world. If our author admits, that benevolence is attended with a natural and immediate approbation, tho' the utility of that virtue, or its tendency to public good, is, in every instance, so obvious; must he not admit, that there is much more reason for justice being supported and recommended by the same natural and direct approbation; and that, in the constitution of our nature, it would be something extremely preposterous, if justice were, in this respect, left upon a worse footing than benevolence; both as justice is more necessary for the subsistence of society than benevolence, and as the utility of {23} justice, in its single and separate acts, is, by the author's own confession, much less obvious and apparent?

But it is needless to insist longer on what is so evident. You yourself, Sir, though you seem to have no small partiality for this author, admit, that there is something which appears unsound in his notions of justice; and which, you are of opinion, will never please philosophers. What will please philosophers is indeed not easy to say, when we find a noble author, who would have taken it very much amiss not to have been ranked in the philosophical class, I mean the late lord *Bolingbroke* (if a pamphlet, published no long ago under his name, be truly his) seriously maintaining, That there is no instinct, or innate principle, in men, which prompts them to compassion; because travellers tell us, That savages and man-eaters seem to have as strong an instinct for cruelty, as for {24} compassion. But, whatever speculations philosophers may devise concerning these matters, in their profound enquiries, if we make an appeal to persons of plain sense and judgment, they will tell us, with one voice, That both justice and compassion are natural principles; which, without reasonings or deductions, either from self love or public good, they find engraven on their hearts.

Having discussed our author's sentiments concerning justice, I will freely own to you, that there is another part of his system which appears to me no less exceptionable; I mean that loose and vague idea of approbation, which he makes to include the whole of the moral feeling, and upon which he founds the distinction betwixt virtue and vice. This seems to me a capital error running through his whole treatise. His notion is, That whatever, in character or conduct, is approved as useful, {25} is virtue; and thus, by reducing morality into the same class in which we place some very trifling qualities, he destroys moral distinctions altogether. It is to be observed, that approbation is a word of a very undetermined signification; and the author has never endeavoured to fix its meaning. It is whatever we take pleasure in; whatever we consider as useful or agreeable. We approve of may inanimate things, in the view of their being useful; useful herbs, useful medicines, houses &*c*. Is this sort of approbation then sufficient to characterise virtue? or may we call these inanimate objects virtuous? No[5], says our author; for, as he tells us, though there is indeed a species of approbation attending inanimate objects, when beneficial; yet it is so weak, and so different from the approbation bestowed upon beneficial magistrates or statesmen, that they ought not to be ranked under the same class or appellation. {26} But let us now take a view of that variety of different objects and qualities which he ranks under the same class of moral approbation; and let us enquire, whether the sentiments they produce in us do not differ as widely as the approbation of inanimate from that of rational objects.

First, he includes in the class of virtues, which are entitled to moral approbation, those qualities of the mind, which are commonly known by the name of intellectual abilities; such as penetration, courage, industry, secrecy, and the like. This is a pretty wide step: for the greatest villain may be possessed of these qualities in a very high degree; and it were strange to say, that they give him any share of moral desert. The world, indeed, value these qualities, as useful to the possessor: but to call every thing virtue which, upon any account, is valued, or which a man would wish to possess as

useful, is {27} strangely altering the use of words; to say no worse of it. Nor will the authority of the ancients, whom he affects to represent as on his side, at all avail him here. For the philosophers, especially *Cicero*, *Plato* and *Aristotle*, when they treat professedly of such virtues as courage, prudence, magnanimity, and the like, always consider them as moral habits, cultivated for the sake of worthy and good ends. And as for the historians, whom he quotes, it is plain that, in drawing characters, they use the word *virtue* in a loose sense, and not with philosophical accuracy.

But, besides those qualities which comprehend the higher sort of abilities, we find our author, bye and bye, extending the moral sentiment of approbation to qualities of an inferior nature, such as chearfulness of temper; politeness and good address; wit; decency; and even cleanliness. When we find these qualities ranked upon a level with the {28} virtues of benevolence, justice, and humanity, we have a sufficient proof how loose our author's criterion of approbation is, and how little to be depended upon. But what comes afterwards is astonishing. He has a section expressly to shew,[6] that the sentiments of regard which bodily endowments, such as strength and beauty, and which riches and other external gods of fortune produce, coincide, in their nature, and the moral approbation, and rest upon the same foundation, *viz*. the utility of these things, or their tendency to produce happiness. Upon this footing, he says, we approve of a rich man, that is, we pay him regard, and prefer him to a poorman; because riches present us those ideas of satisfaction, plenty, cleanliness, &*c*. which are agreeable to the social sense, as conducive to the happiness of mankind. Nay, not only is our approbation of riches put upon a level with our approbation of virtue, but our author {29} descends so low[7] as to account, in the same way, for that approbation which women pay a man of that make of body, which distinguishes what is called, to use his own phrase, a *good woman's man:* "a like principle," he adds, "operating more extensively, is the general source of moral affection and approbation." I must now ask you, what he has left, to distinguish the excellency of virtue from the many trifling accomplishments, which are agreeable or useful in the lowest degree? With how many heterogeneous things has he blended those moral distinctions, which mankind have hitherto held sacred? And does not his theory thereby tend to obscure and lessen the dignity of virtue? Our author, indeed, acknowledges the sentiment of approbation, which we give to some of those useful qualities, to be, perhaps, inferior, in degree, to that which we give to the virtues of justice and humanity: but he contends, {30} however, that the sentiments are similar, and of the same kind. I absolutely deny that they are similar, or of the same kind. One man betrays his trust; is inhuman to his parents, or false and ungrateful to his friend: another man means well, buy, through want of discretion, frequently blunders; is aukward in his address; or blunt and forbidding in his manner. Compare these two together; and I appeal to you, Sir, or to any other man, whether the sentiment of disapprobation and blame in the one case be not very widely different from what it is in the other; and whether we feel the least of that indignation, with respect to the disagreeable or unpolite man, which we feel with respect to the betrayer and the villain? And after all, if morality is to be brought so low, I see no reason for excluding even inanimate objects: if utility is the only characteristic of virtue, they must be comprehended; as it must be owned, that many inanimate objects are much {31) more beneficial than several of the qualities he ranks under the moral class. This consideration, even in a superficial view, must create a suspicion, that our author is not in the right track; and that he has, unwarily, suffered himself to be misled, by following an object that has more of splendour than of substance.

It is a particular disadvantage of our author's theory, that, according to it, no distinct account can be given of our obligation to virtue. In his section upon this head, he resolves it into a motive from interest, leading us to acquire those laudable qualities which, experience teaches us, are so useful.

This confounds all; and shews upon what a weak, or rather, upon what a false bottom his hypothesis is built. For if the word obligation, when applied to morality, has any meaning; if there be any ideas which correspond to the words *ought* and *should*, they certainly imply something else than an interested motive: {32} otherwise, the miser would be under the same obligation to increase his wealth, which is his notion of interest or happiness, as an honest man is to fulfil his word, or pay his debts. Obligation and duty are equivalent terms: and as, according to our author, they extend to all those useful qualities which are the subject of moral approbation, in his sense of the work; it follows, that it is our duty to be chearful, well bred, witty, or cleanly, which are all moral qualities according to his theory, as much as to be just, and honest; or, if the obligation is not precisely in the same degree as to both, it is, however, by his system, most certainly an obligation of the same kind. This seems to me repugnant to sound morals, as well as to the common actions of mankind. It is our author's error, from the beginning to the end, to have overlooked those innate feelings of duty; that authority which conscience carries in itself, prescribing to us certain virtues as a rule or law; upon which {33} alone morality can be founded and ascertained. Instead of this, he has a loose and indeterminate approbation, which may be applied to so many qualities of the mind, and of such different natures, that it can never ascertain virtue or found moral obligation.

What you are most pleased with in this author's performance, you tell me, is his great principle of utility; and you cannot but think he has very happily illustrated it, as a key to that general admiration and esteem which all mankind have for virtue. You think there is something new, and, at the same time, simple and neat, in this manner of stating the foundation of virtue. Not altogether new, I must observe; for Mr. *Hutchenson* led the way by resolving all the several virtues into benevolence, as our author has done into utility; which, in his sense of it, is much the same. That all virtue is useful, or has a tendency to promote general happiness, is {34} what no mortal denies: but the question is, whether that approbation, which we give to virtue, is founded upon the sense of this useful tendency; and whether even the most rude and untaught minds carry this always in view, whenever they approve of an action as virtuous? is it not, for instance, very forced to suppose, with our author[8], that female chastity has no other foundation than a sense of the utility of this virtue? that it is a virtue of great advantage to society, and, in that view, highly to be prized, will be readily granted him. But does he really think, that, when the chastity of a virtuous woman is attacked, it is nothing but the sense of a public interest, and regard to the good of society, that prompts her to maintain her innocence? Besides education and acquired habits, which I allow to have great influence, is there no such thing as an instinct of natural modesty, or a sense of honour or pride, {35} which acts as the guardian of chastity, independent of all utility?

Indeed, the more I reflect upon it, the more presumptions occur, that there is something unsound in the manner in which our author applies his principle of utility. Utility, in his sense of it, signifies the tendency of every kind of quality, whether to our own happiness or to the happiness of others. Now, self-love is, undoubtedly, a stronger principle in our nature than social sympathy; and, therefore, it seems clearly to follow, that, if utility be the only, or chief foundation of the moral approbation, qualities, which are useful to ourselves in particular, ought to raise a much higher degree of this moral approbation, than qualities useful to mankind in general. But this does not hold in fact. Private usefulness raises little or no moral approbation, in comparison of what is raised by being useful to the public. This is a stubborn fact, {36} incapable of being disguised; and, in my apprehension, is quite inconsistent with our author's theory.

Another presumption against his doctrine is this. Were usefulness the principal foundation of morals, justice ought to have a much higher degree of praise and approbation attending it, than

generosity, magnanimity, heroism, or any of the exalted virtues; because, undoubtedly, justice is more useful to the world than any of these. But the contrary holds good in fact. Matters are, indeed, so artfully contrived by the author of our nature, that the transgression of justice is more severely punished by inward remorse, and by universal blame, than a transgression of any of the exalted virtues. But, at the same time, it is certain, that these exalted virtues stand higher, in the praise and approbation of mankind, than justice: which seems clearly to shew, that usefulness {37} is not the chief foundation of that approbation of praise.

But, to come nearer to the point, I think it is in my power demonstrably to evince, That utility cannot possibly be any part of the foundation of morals; and, that our author plainly has mistaken the effect for the cause. And here you will not grudge the utmost attention, where the purpose is to ascertain the true foundation of morality. To begin with benevolence; with regard to which, the author admits, That it is, in some measure, the object of an immediate approbation; but, at the same time, contends, that "[9]at least a part of the merit of benevolence arises from its tendency to promote the interests of our species, and bestow happiness on human society." This, no doubt, is a very innocent proposition, and may be indulged in popular discourse. But, in strict reasoning {38} and true philosophy, it cannot be admitted. By the *merit* of benevolence, our author can mean nothing else but the value which we put upon it; the respect and esteem which we have for it. Now, if this be the meaning, it can easily be demonstrated, That the very reverse of his proposition is true; *viz*. That the merit of usefulness arises from the principle of benevolence. Nothing can be more clear. For, take away the principle of benevolence, where would be the merit of our author's boasted utility? or what foundation would there be for putting any value upon useful actions? To a being that had no benevolence, useful, or pernicious actions, would be indifferent: and, to a being thoroughly malicious, actions of a bad tendency would be the most grateful. It is incontestably clear then, that actions, cone to promote the interests of our species, are approved of, upon the principle of benevolence: and, so far is {39} benevolence from deriving any part of its merit from usefulness, that, on the contrary, the whole merit of usefulness is derived from benevolence.

Let us apply the same sort of reasoning to justice, which, our author strenuously contends, has no foundation whatever, but its usefulness. Before I give my assent to this proposition, the author cannot take it amiss to have question or two put to him. The first is, To what end is justice useful? Our author, foreseeing this question, has given his answer in the following words, "That justice is useful, for preserving to every man the peaceable possession of what he has acquired by his labour and industry." Hiving got satisfaction upon this head, I demand again, Whence arises the utility of preserving to every man the peaceable possession of what he has acquired by labour and industry? The answer must be, that it arises from that peculiar satisfaction which every man has, when he {40} is secured in the possession of such goods, without being exposed to violence; for, had he no satisfaction of this kind, nor any affection for such goods, the utility would vanish. Again, were there no benevolence, would the distress, which man feels when his goods are torn from him, give us any concern? Certainly not. Why then is benevolence overlooked in searching for the foundation of justice? It now clearly appears, not only, that justice supported by benevolence, but, considered as an useful virtue, that it also derives part at least of its merit from benevolence.

But further, our author must acknowledge a fact which is incontestably true, that every man distinguishes goods acquired by his labour and industry, from what he has acquired the possession of by fraud, force, or other unjustifiable means. With regard to the former, he is conscious of wrong done him {41} when dispossessed by violence; he calls such an action robbery: when deprived of the latter by the hands of justice, he has no such consciousness; but rather, that he was

treated as he deserved. At the same time, all mankind join with him in these sentiments; and hence that universal indignation against those who, breaking through all natural restraints, are guilty of robbery or theft.

But one step further, my dear Sir, and we shall have displayed to us in full light the true and solid foundation of justice. Recollecting what is laid down above, we find, that goods which we have acquired by labour and industry, by inheritance, or by other honest means, are distinguished form all others. We have a peculiar affection for such goods: we have a consciousness of wrong when deprived of them; and the person, who commits the wrong, {42} becomes the object of our resentment, and of the indignation of mankind. Here, a relation is established betwixt us and such goods by the strongest natural sentiments; and this singular relation, mankind have agreed to denominate by the word *property*. It is evident then, in the first place, that property is founded in the nature of man, antecedently to all positive laws and conventions: in the next place, that justice derives its force and authority from the singular feelings which characterize property; and consequently, that justice rests upon these feelings, as its true and solid foundation.

To conclude, the error is the same here that our author has unwarily committed, with regard to benevolence. He has endeavoured to invert human nature, by assigning that as the cause which is truly the effect. "Utility," he says, "is the foundation of justice, {43} and justice of property:" whereas, in truth, property, and the natural sentiments which give it birth, are the foundation of justice, as well as of all the utility we ascribe to it. And, after all, a single reflexion might have made this evident to him. Laying aside property and the natural sentiments which produce it, there could be no such thing as injustice; we could have no conception of justice; and as little of that beauty, merit and usefulness we ascribe to it.

In handling this subject, I would by no means be understood to deny, that usefulness, by a reflex act, may become an additional motive to justice. I only assert, that it is not the foundation of this virtue; which, I think, can be clearly traced back to a primary, original feeling in human nature. The case of justice, with respect to utility, is pretty much the same as that of eating and {44} drinking, with respect to self-preservation. Nature has provided us with proper appetites, which move us to eat and drink, in the same manner, as the feelings of right and wrong move us to do justice. Justice, it is true, is useful, and so are eating and drinking; but usefulness is not the foundation or principle of either; though usefulness may sometimes become an additional motive to do justice, as well as to take nourishment when we have no appetite.

The above is so agreeable to the natural notions of mankind, that whoever endeavours to establish an opposite theory, will find it difficult to keep clear of contradictions. Our ingenious author may be taxed with something of this nature. For, reasoning upon the usefulness of justice[10], he shews it to be the design of public laws, to secure to every man the peaceable possession of his property, the privilege of transmitting {45} it to his posterity, and the power of transferring it to others, by mutual consent. This is, in effect, acknowledging the idea of property to be antecedent to these laws, and to be the foundation of them. And yet, in the same page, he asserts, That *mine* and *thine* have no meaning, but in consequence of these laws. Thus, he makes property the foundation of these laws, and these laws the foundation of property.

I am not surprised you should be pleased with a work, which, in an elegant dress, promises a neat and simple theory of morals. But, if the above hints shall engage you to a more accurate review, I am confident you will discover this new theory to be slight and altogether unsound. Human nature is a complex machine; and, by a careful investigation of its several springs and movements, it

appears {46} to me, That we are more likely to arrive at a just view of morals, as a science, than by establishing, too hastily, a single principle, and building an entire system upon it. Any further observations of mine you desire, I shall always be ready to communicate, as you know me to be, with sincere attachment,

SIR,

Your most humble Servant.

FINIS.

"Postscript on Mr. Hume's Natural History of Religion"

Three Questions Resolved

Caleb Fleming

1757

Editor's note: Caleb Fleming (1689-1779) was a dissenting Protestant clergyman whose views were antitrinitarian and deistic. He was a prolific pamphleteer with over a hundred religious and political titles to his credit, most written anonymously. Fleming's *Three Questions Resolved* was published anonymously in 1757. The complete title of the pamphlet, which summarizes its contents, is *Three Questions Resolved. viz. What is religion? What is the Christian Religion? What is the Christian Catholic Church? wherein Popery is proved to have no Claim, either as a Religion, as the Christian Religion, or as the Christian Catholic-Church. In Three Letters to ---- Esq. with a Postscript on Mr. Hume's Natural History of Religion* (London: A. Henderson, 1757). In the Postcript, Fleming criticizes Hume's contention that religion is founded on principles of the imagination, as opposed to rational proofs of a single creator. He also criticizes hume for identifying the history of superstition with that of true religion. He concludes on a positive note, though, that, "Notwithstanding these sophisms, Mr. *Hume* has finely exposed superstition... and so far as he is a theist, he cannot be an enemy to genuine christianity." The *Monthly Review* comments generally about the pamphlet that "We have here some just sentiments on religion in general, and on the Christian religion in particular, delivered with the utmost freedom" (1757, Vol. 16, pp. 470-472). Biographies and bibliographies on Fleming are in Walter Wilson's *History and Antiquities of Dissenting Churches*, (London: 1862), Vol. II 283-290, and the *Dictionary of National Biography*. Only the Postscrtipt to the pamphlet is presented here, and is from the 1757 and only edition of *Three Questions Resolved*.

Postscript on Mr. Hume's Natural History of Religion

{50}

P.S. **Mr. David Hume, in *his natural history of religion,* allows its foundation in reason to be most obvious.**

> **"For no rational enquirer can, after serious reflexion, suspend his belief a moment with regard to the primary principles of genuine theism and religion."**

But then he thinks it more difficult to shew, "its origin in human nature."[2] On these principles he grounds his enquiry. But what can he mean by religion admitting the clearest solution, concerning the foundation it has in reason; yet, not so concerning its origin in human nature? May reason then be separated from human nature in the religion of mankind? Is this possible? How shall it be done, when no rational enquirer can, after serious reflexion, suspend his belief one moment with regard to the primary principles of genuine theism and religion.

To secure his distinctions,

> **"Polytheism or idolatry was, and necessarily must have been the first and most ancient religion of mankind. For, the most ancient records of the human race still present us with Polytheism as the popular and established system."[3]**

Does it not seem more natural to conclude, that from the creation mankind clearly saw the invisible things of {51} God? But that when they knew God, they glorified him not as God, became wanton in their imaginations, and so corrupted the primary principles of pure theism. If the history of *Moses* be authentic, men degenerated from true theism to idolatry; and by their debaucheries brought on the destructive deluge. The primary religion of the new world, peopled by *Noah* and his family, surely could not be polytheism and idolatry. And certain we are, superstition, polytheism or idolatry could not be the primary profession of christians. Especially since Mr. Hume has said,

> **"nothing indeed would prove more strongly the divine origin of any religion, than to find, (and happily this is the case with christianity) that it is free from a contradiction, so incident to human nature."[4]**

Whatever was his design, this is the true character of genuine christianity, untouched by the over-officious fingers of men. And to which, this elegant writer seems much indebted for that charming description of theism,

> **"a system which supposes one sole deity, the perfection of reason and goodness, which if justly prosecuted, will banish every thing frivolous, unreasonable, or inhuman from religious worship, and set {52} before men the most illustrious example, as well as the most commanding motives of justice and benevolence."[5]**

It must be allowed a fine copy of the Gospel original; and could be taken from no other system.

This lively writer makes some very uncommon observations.

"Men have a natural tendency to rise from idolatry to theism, and to sink again from theism into idolatry." And he concludes, "that religion and idolatry have one and the same origin." See his 8th section.

But in his 10th, "the corruption of the best things give rise to the worst."[6] Of this we have some conception. Not so of theism and polytheism having one origin. Nor of the natural tendency in men

to rise from idolatry to theism. And we should be inclined to ask some proof, how it comes to pass, that in this natural tendency to both extremes, we see not the mechanical vibrations of the pendulum equal, or nearly equal? How can we read over Mr. HUME's *natural history of religion*, and give him credit, if this observation has any truth in it? Why such an universal polytheism, if there be this natural tendency in man to rise from idolatry to theism?[7]

There is another discovery made by this {53} Philosopher, and that is, "the origin of idolatry or polytheism, is, the active imagination of men, incessantly imployed, in cloathing the conception they have of objects, in shapes more suitable to its natural comprehension."[8] Which if conclusive, then religion and idolatry, theism and polytheism are equally natural to man; and have alike a very fanciful origination.

But in truth, his idea of the religion of mankind, does not intend more, than the superstition which has arisen from depravity. For, sais he, "one may safely affirm, that all popular theology, especially the scholastic, has a kind of appetite for absurdity and contradiction. If that theology went not beyond reason and common sense, her doctrines would appear too easy and familiar. Amazement must of necessity be raised: mystery affected: darkness and obscurity sought after: and a foundation of merit afforded the devout votaries, who desire an opportunity of subduing their rebellious reason, by the belief of the most unintelligible sophism."[9] Is not this *Sir*, a fair specimen of what he means by the religion of mankind? But could this be the first and most ancient religion of mankind? Does he not explicitely own it could not?[10] "In short, all virtue, when men are reconciled to it by ever so {54} little practice, is agreeable: all superstition is for ever odious and burthensome."[11] And again, "after the commission of crimes, there arise remorses and secret horrors, which give no rest to the mind, but make it have recourse to religious rites and ceremonies, as expiations of its offences. Whatever weakens or disorders the internal frame, promotes the interests of superstition: and nothing is more destructive to them than a manly, steady virtue, which either preserves us from disastrous, melancholy accidents, or teaches us to bear them. During such calm sun-shine of the mind, these spectres of false divinity never make their appearance. On the other hand, while we *abandon our selves* to the undisciplined suggestions of our timid and anxious hearts, every kind of barbarity is ascribed to the supreme Being, from the terror with which we are agitated; and every kind of caprice, from the methods which we embrace, in order to appease him."[12]

I would not mistake this writer, and therefore produce another of his descriptions of the popular religions; in which he is very express in shewing, that these superstitions have not their origin in human nature. "And that it may safely be affirmed, many popular religions are really, in the conception of {55} these more vulgar votaries, a spirit of Daemonism; and the higher the deity is exalted in power and knowledge, the lower of course is he frequently depress'd in goodness and benevolence; whatever epithets of praise may be bestowed on him by his amazed adorers. Amongst idolaters, the words may be false, and belie the secret opinions: but amongst more exalted religionists, the opinion itself often contracts a kind of falsehood, and belies *the inward sentiment. The heart secretly detests such measures of cruel and implacable vengeance*; but the judgment dares not but pronounce them perfect and adorable. *And the additional misery of this inward struggle* aggravates all the other terrors, by which these unhappy victims to superstition are for ever bounded."[13]

From this citation, I would ask, whether Mr. *Hume* has not acknowledged, that idolatry and superstition are not natural to man? And that consequently, the principles of genuine theism and religion, must have their origin in human nature. Superstition, the gloomy dread of deity, is no

primary principle in the heart of man.[14] The opinion belies the inward sentiment: there is a secret detestation of it in the heart!

I presume to make the following conclusions. {56}

Mr. *Hume*'s fundamental principles are manifestly wrong. He has called the superstition of the world, *a natural history of the religion of mankind*. He has affirmed, a natural tendency in man to rise out of idolatry into religion. He has strangely declared, that religion and superstition, theism and polytheism have one and the same origin; and this no better than the imagination. Whereas, religion and reason in man, are inseparable. Religion could not arise out of superstition, theism out of polytheism. The universal spread of idolatry, by his own history, [just] as universally confronts the proposition: and will not suppose it to have the least foundation in nature. For superstition has its origin in the disordered passions and imaginations of mankind; religion has its origin in a natural sovereignty which the reason of man exercises over these faculties. And from the nature of the thing, idolatry or polytheism could not be the primary profession of mankind; but must have been a corruption of pure theism and religion. Notwithstanding these sophisms, Mr. *Hume* has finely exposed superstition and popery: professeth himself an advocate of pure theism. And so far as he is a theist, he cannot be an enemy to genuine christianity.

Remarks on Mr. David Hume's Essay on The Natural History of Religion

William Warburton

1757

Editor's note: William Warburton (1698-1779) was bishop of Gloucester and was known for his editions of Shakespeare and Pope, his attack on deism in the *Divine legation of Moses demonstrated....* (1737-1741), and his involvement in numerous controversies. He first became interested in Hume in 1749 after reading the essay "Of Miracles" which prompted him to sketch a brief attack.[2] His contempt for Hume's essay is also reflected in a passing reference in his 1751 edition of Pope's *Dunciad*.[3] Warburton originally wrote his *Remarks* in the margin of his copy of Hume's *Four Dissertations*, which his colleague Richard Hurd later transcribed into publishable form. It appeared anonymously in 1757, six months after Hume's *Four Dissertations*, disguised as a letter *to* Warburton by an unnamed admirer. The *Critical Review* opened its review of the *Remarks* with the following:

> **This little Pamphlet of seventy-six pages contains some short, but severe strictures on Mr. David Hume, addressed to the learned Dr. Warburton, with whose works our author seems to be intimately acquainted. He hath therefore professedly copied that ingenious writer's turn of thinking and expression, which he has done, as the Italians say, *con amore*. Whether the copy is exact, or, to use the painter's phrase, is done after the doctor's best manner or not, our readers will be able to determine....**

Hume learned of Warburton's authorship from his printer, William Strahan, who also printed the *Remarks*.[4] In a letter to his publisher, Andrew Millar, Hume writes: "I am positively assurd, that Dr Warburton wrote that Letter [i.e. *Remarks*] to himself which you sent me; and indeed the Style discovers him sufficiently."[5] Nevertheless, in his autobiography, Hume identifies Hurd as the author, and not Warburton.[6]

In 1777, shortly after Hume's death, the *Remarks* were published again, with only minor changes in spelling and punctuation, probably introduced by the printer. The 1777 edition contains the following preface:

> The bookseller to the reader: The following is supposed to be the Pamphlet referred to by the late Mr. David Hume, in Page 21, of his Life, *as being written by* Dr. Hurd. Upon my applying to the Bishop of Litchfield and Coventry for his permission to republish it, he very readily gave me his consent. His Lordship only added, he was sorry he could not take to himself the whole infamy of the charge brought against him; but that he should hereafter, if he thought it worth his while, explain himself more particularly on that subject. Strand, March, 1777. T. Cadell.[7]

Warburton died in 1779, and in 1788 the first edition of his collected works appeared, which included the *Remarks* in Volume seven.[8] The 1788 edition retains the printer's alterations from the 1777 edition and introduces further changes, both major and minor. In 1794 Hurd wrote his *Discourse, by way of general preface* to this edition of Warburton's Works (excerpts of which are included in this anthology). There Hurd explains his own role in the *Remarks*,[9] and notes that the 1788 edition presents the *Remarks* "in their original form," presumably as appeared in Warburton's marginal comments. Comparison of the 1757 and 1788 editions indicates that Hurd's literary contribution to the piece was mainly in writing the opening address and conclusion. He also added to the body a few paragraphs and transitional sentences. The 1811 and 1848 editions of Warburton's *Works* follow the 1788 edition. I have followed the 1757 version which includes Hurd's contributions. Major changes which appear in the 1788 edition are given in footnotes. Biographies on Warburton are Hurd's *Discourse* (1794), John Selby Watson's *The Life of William Warburton* (London: 1863) and A.W. Evans's *Warburton and the Warburtonians*, (London: 1932).

REMARKS ON MR. DAVID HUME'S ESSAY ON THE NATURAL HISTORY OF RELIGION: ADDRESSED TO THE REV. DR. WARBURTON.

"To wash away a few slight stains be mine;
"Charge him with Heaven's artillery, bold DIVINE.[10]

* * * *

TO
The Rev. Dr. WARBURTON.[11]

REV. SIR,

I TAKE leave to address myself to you as to the supposed Author of the FOUR LETTERS *on Lord Bolingbroke's Philosophy*.[12] Under this character, if indeed it belongs to you, you seem to have a

right to the following Remarks; which are, in truth, little more than your own Remarks, only transferred from your Patrician, to this Plebeian Naturalist.

Permit me to say, that you have unmasked and for ever discredited the philosophical lucubrations of that unhappy Nobleman; who, in times that demanded the mere Politician to assist in impressing the belief of a moral Governor on the minds of men, was so forsaken of every patriot principle as to labour with all his might to exclude the Creator from his Works, and by the doctrine of an impious fatalism to emancipate an abandoned people from the FEAR OF GOD.

It became the eminence of your character to go forth against this bold invader of Heaven. Your conquest was complete. And what could one expect as the fruit of it, but that, this chieftain of Impiety being subdued, the rabble of the enemy would disperse and fly before you; at least that they would not rally again, till in future times some other Champion of their cause, as illustrious by his name and quality, should arise to reconduct them to the charge.

But, alas! the irreligious Spirit, tho' it may be disgraced, is not so easily suppressed. E'er the public had time to celebrate your triumphs, behold a puny Dialectician from the North, (for as Erasmus long since observed, *Scoti* DIALECTICIS ARGUTIIS *sibi blandiuntur*),[13] all over armed with doubts and disputation, steps forth into his place; and, with the same beggarly troop of routed sophisms, comes again to the attack.

But now, as the enemy is so contemptible, and the danger so little pressing, you may well enjoy your repose, and leave it to some inferior hand to chastise his insolence. And the very weakest may be equal to this attempt. For nothing remains but to employ against him the weapons which you have furnished; in a word, to draw again that sword of the spirit, which you had borrowed from the Sanctuary, and whole resistless splendour flashes, if not conviction, yet confusion in every face.

To this office I presume to devote myself. I have a portion at least of your zeal to animate my endeavours. And if my talents should be found as mean as those of my Adversary, this circumstance would not discourage me. The contest would only be more equal; and in such a quarrel the serious advocate for Religion would be sorry to owe his success to any thing but the goodness of his cause.

This, Sir, is all I had thought to say of myself. But being got on so seducing a subject, the importance, which every author is of to himself, makes me imagine that perhaps you may be tempted to push your inquiries concerning me somewhat farther. And if, haply, any such curiosity should be raised, tho' I have my reasons for being a little on the reserve with you, something at least I could be content to hazard for your satisfaction.

Of my *Person*, indeed, I must have leave to make no discovery. And to tell you the truth, I have taken such effectual precautions as to that particular, that I venture to say you will never know more of me than you do at present. You may believe, if you please, that my vanity has suffered something in resolving on this concealment.

But then in quality of *Author* of these Remarks, I have not the same scruples. It may be fitting, you should know something more of the WRITER'S intention and character. And in this respect he is very ready to gratify you.

THE AUTHOR then of these Remarks on Mr. Hume's Essay is ONE who, as you would otherwise conclude from the Remarks themselves, hath made a diligent study of your works; is familiar and, in a manner, conscious to your turn of thinking upon all subjects; and interests himself, more particularly, in all your views and projects for the support and advancement of religious truth.

But notwithstanding this intimacy with you, which might be justly suspected of creating a bias in most minds, he arrogates to himself the merit of judging of you more freely, nay to be plain with you, more severely, than perhaps your enemies themselves. He is extremely apprehensive of being misled or imposed upon in matters of this high concern: he considers the difficulty of the subjects; the fascination of favourite principles; the errors to which the best and most watchful writers are liable: And is the last man in the world who, out of a fondness for your notions, would neglect or betray any useful truth. He is One therefore that weighs your arguments without considering your authority, or even the disgrace you might be thought to incur from the confutation of them. Reading and criticizing you with this spirit, you are not to wonder that he hath sometimes seen cause to censure, where others admire. He hath even considered your volumes with a diligence which might have profited your adversaries; for he hath detected, not inaccuracies only, but *weaknesses* in your writings, which the most malignant of them have overlooked. To make you amends for this mortification, he does you the justice to profess that those Adversaries, as far as he is acquainted with them, have universally done you wrong.

With all this suspicious and unrelenting criticism about him, he is ready to believe however that your views are honest: he acknowledges that the main of your System is strong and impregnable; he sees no reason for you to desert the great design you have undertaken; and admits that your talents for the execution of it, tho' not in his eyes what your fond admirers represent them, yet are such as may not unusefully, and, considering the times in which we live, may even creditably enough be employed by you in such a cause.

In a word, the AUTHOR of these Remarks is One who approves your Principles; or he would not have made use of them, even in this service. He thinks there is force and conviction in your Reasonings; or he would not have tried the strength of them upon others, and least of all upon so captious, versatile, and evasive a writer as Him, with whom he is here concerned. But what he takes upon himself to say he is most confident of, is your *zeal for the interests of truth and virtue*; without which, whatever your merit there might be in your writings, he could have no complacency in the writer.

In consequence of this last judgment, which he forms of you, he hath not scrupled to adopt your *manner* of composition, as well as Arguments. He knows what the gentle reader thinks of it. But he is not one of those cool opposers of Infidelity, who can reason without earnestness, and confute without warmth. He leaves it to others, to the soft Divine and courtly Controversialist, to combat the most flagitious tenets with serenity; or maintain the most awful of religious truths in a way, that misleads the unwary reader into an opinion of their making but little impression on the writer's own heart. For himself, he freely owns he is apt to *kindle* as he writes; and would even blush to repel an insult on sense and virtue with less vigour than every honest man is expected to shew in his own case.

At the same time he is not so blinded by his zeal, as to overlook a difference on OCCASIONS. He would not incur the ridicule of misapplying his strength; and is therefore content to soften his polemics a little, not in complaisance to such judges, but in conformity to his subject. Yet to put matters at the lowest, he remembers what the character of his piece should be, as delivered by a great Master -- MULTAE, ET CUM GRAVITATE, FACETIAE: QUODQUE DIFFICILE EST, IDEM ET PERORNATUS ET BREVIS.[14] And if he should not be thought to have catched the spirit of it so fully, as you have done on certain occasions, he pretends at least to have had this character in view, and to have copied it, as he was able; tho' at the hazard, he foresees, of passing with the too delicate critic, for a SERVILE IMITATOR.

This, Sir, is the whole of what he thinks fit to declare of himself. For the REMARKS themselves, which are here offered you, he pretends only, that they are such as occurred to him on a single reading of the Essay; that they were entered hastily on the margin, as he went along; and that he now transcribes them with little or no variation, for the public use. Nor let that Public take it amiss from the writer, that he treats them with this appearance of neglect. The various topics, he knows, which are touched upon in the Essay, might afford room for much useful and curious speculation. He knows too, what his Duty to the public requires from him on a proper occasion. But he never designed the following animadversions for an elaborate piece of instruction or entertainment to the learned reader. He would only employ a vacant hour in exposing to the laughter of every man, that can read, the futility, licence, and vanity of Mr. DAVID HUME.

REMARK I.

The writer, I have to do with, is a Veteran in the dark and deadly trade of Irreligion. But my concern at present is only with a volume of his, just now given to the public and entitled, FOUR DISSERTATIONS. And of these *Four*, I confine myself to the FIRST, which bears the portentous name of an Essay, *On the natural history of Religion*.[15]

The purpose of it is to establish NATURALISM on the ruins of RELIGION; of which, whether under Paganism and Polytheism, or under Revelation and the doctrine of the Unity, he professes to give the NATURAL HISTORY.[16]

And here let me observe it to his honour, that, tho' he be not yet got to THEISM, he is however on the advance and approaching to the borders of it;[17] having been in the dregs of Atheism when he wrote his Epicurean arguments against the being of a God.[18] Sometime or other he may come to his senses. A few animadversions on the *Essay* before us may help him forwards. The thing is full of curiosities: And the very *title-page*, as I observed, demands our attention. It is called,

THE NATURAL HISTORY OF RELIGION.

You ask, why he chuses to give it this title. Would not the *Moral history of Meteors* be as full as sensible as the *Natural history of Religion*? Without doubt. Indeed had he given the history of what he himself would pass upon us for the only true Religion, namely, NATURALISM, or the belief of a God, the Creator and Physical Preserver, but not moral Governor of the world, the title of *Natural* would have fitted it well, because all *Morality* is excluded form the Idea.

But this great Philosopher is never without his Reasons. It is to insinuate, that what the world calls Religion, of which he undertakes to give the history, is not founded in the JUDGMENT, but in the PASSIONS only. However the expression labours miserably, as it does thro' all his profound Lucubrations. And where is the wonder that he who disdains to think in the mode of common sense, should be unable to express himself in the proprieties of common language?

***As every Inquiry which regards Religion* (says that respectable Personage) *is of the utmost importance, there are two questions in particular which challenge our principal attention, to wit, that concerning its foundation in reason, and that concerning its* ORIGIN IN HUMAN NATURE.[19]**

Here we see, he aims at a distinction. And what he aims at is not hard to find. The question is, whether he has hit the mark. I am afraid, not. And then the discovery of his aim is only the detection of his ignorance. In a word, it is a distinction without a difference.

If man be rightly defined a *rational animal*, then his Nature, or what our Philosopher calls *human Nature*, must be a *rational* Nature. But if so, a FOUNDATION IN REASON and an ORIGIN IN HUMAN NATURE are not too different predicates, but one and the same only in different expressions. Do I

say, therefore, that our Philosopher had no meaning, because he was unable to express any? Far be that from the Reverence due to this Rectifier of Prejudices. My objection at present is not to his Theology but his Logic. By *Origin in human Nature* he meant, Origin in the fancy or the Passions. For that Religion, which has the origin, here designed, is what the world calls RELIGION; and this he resolves into *fanaticism* or *superstition*: As that Religion which has its *foundation in reason* is what the world calls NATURALISM, the Religion of Philosophers like himself, and which he endeavours in the Essay to establish.

But do not believe, I intend to meddle with this *Religion of Philosophers* any further than to expose it to the public contempt, as it deserves. Even I should be finely employed, not to say you, to enter into a formal confutation of Mr. David Hume's *Naturalism*. However I think it incumbent on me to prove, that this is indeed the Religion which this honest man means to recommend in his *Natural History*. For so heavy a charge ought never to be made without good evidence to support it.[20]

In his third Section, at the 16th page, he makes UNKNOWN CAUSES the origin of what men call *Religion*, that Religion which his History pretends to investigate.

> These UNKNOWN CAUSES, says He, become the constant object of our hope and fear; and while the passions are kept in perpetual alarm by an anxious expectation of the events, the imagination is equally employed in forming ideas of those powers, on which we have so entire a dependance.

He then goes on to acquaint us with the original of these UNKNOWN CAUSES.

Could men anatomize Nature, according to the most probable, at least the most intelligible philosophy, they would find, that these *Causes* are nothing but the particular fabric and structure of the MINUTE PARTS OF THEIR OWN BODIES AND OF EXTERNAL OBJECTS; and that, by a regular and constant machinery, all the events are produced, about which they are so much concerned. But this Philosophy exceeds the comprehension of the ignorant multitude.[21]

Here we see, the original of these *unknown causes* is nothing but the result of MATTER and MOTION. And again,

> The Vulgar, that is, indeed, ALL MANKIND, a few excepted, being ignorant and uninstructed, never elevate their contemplation to the Heavens, or penetrate by their disquisitions into the SECRET STRUCTURE OF VEGETABLE OR ANIMAL BODIES; so as to discover a supreme mind or original providence, which bestowed order on every part of Nature. They consider these admirable works in a more confined and selfish view; and finding their own happiness and misery to depend on the secret influence and unforeseen concurrence of external objects, they regard, with perpetual attention, the UNKNOWN CAUSES, which govern all these natural events, and distribute pleasure and pain, good and ill, by their powerful, but silent, operation. The UNKNOWN CAUSES are still appealed to, at every emergence; and in this general appearance or confused image, are the perpetual objects of human hopes and fears, wishes and apprehensions. By degrees, the active imagination of men, uneasy in this abstract conception of objects, about which it is incessantly employed, begins to render them more particular, and to cloathe them in shapes more suitable to its natural comprehension. It represents them to be sensible, intelligent beings, like mankind; actuated by love and hatred, and flexible by gifts and entreaties, by prayers and sacrifices. HENCE THE ORIGIN OF RELIGION: *And hence the origin of idolatry or Polytheism*.22

The *few excepted* out of the *whole race of mankind* are, we see, our Philosopher and his gang, with

their Pedler's ware of *matter* and *motion, who penetrate by their disquisitions into the secret structure of vegetable and animal bodies,* to extract, like the Naturalist in Guliver, *Sunbeams out of Cucumbers*; just as wise a Project as this of raising Religion out of the intrigues of *matter and motion*.

All this shews how desirous our Essayist was of not being misunderstood: as meaning any thing else than Naturalism (or the belief of a Creator and Physical Preserver, but not Moral Governor) by the Religion he would recommend in the place of that Phantom, whose physical, or rather metaphysical, history he is writing. For this Phantom of a Religion, which acknowledges a *moral Governor,* arises, he tells us, from our ignorance of the result of *matter* and *motion,* caballing *in the minute parts of vegetable and animal bodies*.

The sum then of all he teaches is this; That that Religion, of which he professes himself a follower, and which has *its foundation in Reason,* is NATURALISM: and, That that Religion which *all mankind* follow, *a few excepted,* and of which he undertakes to give a *natural history*, is nothing but *Superstition* and *Fanaticism,* having *its origin in human Nature*; that is, in the imagination and the passions only.

REMARK II.

This fully justifies the censure, which has been passed upon him for his *History of Great Britain*; namely, that he owned no RELIGION but what might be resolved into SUPERSTITION or FANATICISM; having represented the established Episcopal Church, and the tolerated Presbyterian Form under the Names and the Ideas of Superstition and Fanaticism.[23] Indeed, (to do him justice,) tho' with much offence, yet without much malignity and contrary to his intention. For he ingenuously enough confessed, that he gave his History that attic seasoning for no other end than to fit it to the palate of a very polite people; whose virtues, having only reached him at a distance, had, as is usual, been much exaggerated. To make amends, however, for this false step, he thought proper to give an ample apology for his conduct towards the close of the second Volume of his History.24 And this containing something more than an Insinuation that he believed, what his *Natural History of Religion* shews he does not believe, namely, the truth of Christianity, I shall take leave, without any suspicion of being thought to go out of my way, to consider it paragraph by paragraph.

This Sophism, says he, *of arguing from the abuse of any thing, against the use of it, is one of the grossest, and at the same time the most common to which men are subject. The history of all ages, and none more than that of the Period which is our subject, offers us examples of the abuse of Religion: And we have not been sparing in this volume, more than in the former, to remark them. But whoever would from thence draw an inference to the disadvantage of Religion in general, would argue very rashly and erroneously*.[25]

Thus he begins his Apology: And would not every Reader of him naturally believe that he was quoting the words of an animadverter upon him, in reproof of this very Sophistry; which he was going to answer? For who was it that had been *drawing this inference to the disadvantage of Religion*, but our wise Historian himself; who had acknowledged no Religion but one or other of these specieses, *Superstition* or *Fanaticism*; and had done his best to shew of what infinite mischief both of them were to Society? The Reader may believe what he pleases; (and if he be a Reader of Mr. Hume, he will find exercise enough for his faith) but, this sage observation is our Historian's own. And the pleasantry of it, is, you are obliquely requested to consider it as a reproof, not of his own malice, but of the folly of his readers, who understood their Historian to be in *earnest* when he

gave this picture of the religion of his country; whereas they had read him to little purpose, if they did not see him to be in the number of those who throw about them firebrands and death, and say, am I not in *jest*? However, to be fair, I am ready to excuse *his readers* in this (perhaps they can be excused in little else) for it is not to be disguised that their master does indeed make *the abuses of Religion* and *Religion itself* to be one and the same thing. All things considered therefore, I cannot but take this introduction to his apology, to be the pleading guilty with the insolent air of an Accuser, and, under the circumstances of a convict, talking the language of his judge.

However, tho' in his first Volume of History he neither spoke of, nor supposed any other Religion than what might be comprised either under superstition or fanaticism, yet here, in the second, he does indeed bring us acquainted with another, and defines it thus; *The proper office of Religion is to reform men's lives, to purify their hearts, to inforce all moral duties, and to secure obedience to the laws of the civil Magistrate*. Now, was Mr. David Hume only playing the Philosopher, I should take this to be no more than the Definition of a mere *moral mode*, known by the name of a *divine philosophy in the mind*; something fluctuating in the *brain* of these Virtuosi, and ennobled with the title of *Natural Religion*: But as he is writing History, and the History of Great Britain, where the *Religion of Jesus*, as he has since learnt, is yet professed, I can hardly persuade myself that he can mean any other, than a Religion whose abode is in the *heart*, and which expatiates into virtuous practice; and is therefore indeed capable of performing all these good things he speaks of. But why then, when he had heard so much of those bug-bear Counterfeits, *Superstition* and *Fanaticism*, was there not one Word slipt in, in recommendation of this *reforming Religion*? One word, in mere charity, for the honor of his dear country? That Strangers at least (for he writes at large and for all mankind) might not suspect, if ever indeed there was a true Religion amongst us, that these Impostors and Counterfeits had driven her quite away. Well; be not too hasty. To this he has an admirable Answer; and you shall have it in his own Words -- *While it* [i.e. the true species of Religion, which he had just defined] *pursues these salutary purposes, its operations, tho' infinitely valuable, are secret and silent, and seldom come under the cognizance of history. The adulterate species of it alone, which inflames Faction, animates Sedition, and prompts Rebellion, distinguishes itself on the open theatre of the world, and is the great source of Revolutions and public Convulsions. The Historian therefore has scarce any occasion to mention any other kind of Religion, and he may maintain the highest regard for true piety, even while he exposes all the abuses of the false*.

So it seems, that what *reforms men's lives, purifies their hearts, inforces moral duties, and secures obedience to the laws of the civil magistrate,* is not worth a wise Historian's Notice. If it were, he gives a very cogent reason why he should bring it to the Notice of his readers likewise, for he tells us that the effects of this are SECRET and SILENT. Should not the Historian therefore lend a tongue to this powerful but modest directress of human life, and bring her in all her lustre into our acquaintance? But *she seldom comes under the cognizance of History*. More shame for these false masters of the Ceremonies who so scandalously abuse their office.

Then it is, the Historian shines when he celebrates that *adulterate species of Religion, which inflames faction, animates sedition, and prompts rebellion*: For then it is that to these public Mischiefs he may add his own, and under the cover of the *adulterate species* inculcate to the people that all Religion is either *superstition* or *fanaticism*.

If this was not his purpose, and he had no other design than to write sober history, how could it ever enter into his head, that it was not at least equally his business to explain to us what that thing is which makes society happy, as what that is which makes it wretched and miserable? But from the honest man let us turn to the able writer, for in that light too he seems to have failed. It appears

to me a matter of much greater importance that we should be brought acquainted with true religion and its blessings, than with the false and all its mischiefs: Because how shall we be able to avoid the latter, under our ignorance of the former, without running into the opposite extreme, and professing no religion at all? Now, tho' this perhaps is what our historian would be at, yet he has found by experience, his Readers are not so ready to follow as he is to lead.

Had our Historian only consulted the Dignity of his Subject, in this too he would have found a great difference; or if he could not, a great example at least was before his eyes, to have pointed out that difference; Lord BACON, in his history of Henry VII. This, which in many respects is a model for this kind of writing, is much larger and more precise in the account of those Laws by which Henry laid the foundation of a flourishing and happy Kingdom, than of the Insurrections and Rebellions which disturbed his own reign.[26] Had he taken our Author's route, and incurred the censure so justly due to it, I apprehend he had made a very foolish figure both amongst his contemporaries and posterity, by an apology of this kind. *The proper office of* LAWS *is to reform men's lives, to inforce all moral duties and to secure obedience to the civil Magistrate; but while they pursue their salutary purposes, their operations, tho' infinitely valuable, are secret and silent, and seldom come under the cognizance of History*. LAWLESS RAGE *alone, which inflames faction, animates Sedition, and prompts Rebellion, is what distinguishes itself on the open theatre of the world, and is the proper province of the Historian*. Suppose this great Historian, and He too was a *Philosopher*, had executed what he once projected, the history of his illustrious Mistress, are we to believe that because Walsingham's *Salutary operations* were done in *Secrecy* and in *Silence*, that there he would let them have lain, as *not coming under the cognizance of history*, and *only* buried[27] himself in a circumstantial detail of the rogueries and turbulencies of the sons of Loyola? Would he not have gained more honour to himself, and procured more benefit to his reader by revealing and explaining all the wheels and movements of that political machine, from which, as from the urn of a Demi-God, flowed abundance and felicity on his country, than by unravelling the intrigues of the Jesuits which spread sedition, rebellion and murders all around them?

But to see how differently men's heads are framed even amongst great Historians. TACITUS laments bitterly that his fortune had thrown him in an age, when there was nothing to write of but these horrors, *factions, seditions, public convulsions and Revolutions*.

> **Opus aggredior opimum casibus, atrox praeliis, discors seditionibus, ipsa etiam pace faevum: quatuor principes ferro interempti: tria bella civilia, plura externa, ac plerumque permixta.[28]**

Our Christian Historian riots in these calamities; and thinks that *what inflames faction, animates sedition, prompts rebellion, and distinguishes itself on the open theatre of the world, is the only thing becoming the dignity of History*.

In a word, the offence he gave was for calling the Christian Religion, *Superstition* and *Fanaticism*. He says, it was *false* Religion, not the *true*, which he thus qualifies. He is asked then, how he came to say so much of the *false*, and nothing of the *true*? His answer is, That the true does everything in *secrecy and silence*. The greater occasion therefore was there for him to reveal this noble Mystery; for he tells us that both its aims and operations are *infinitely valuable*. If therefore he be for keeping it hid, like a court-secret, or if, in his own words, *it comes not under his cognizance*, we must conclude, that either he knows little of the matter, or that he believes less.

In conclusion, his own Apology has reduced him to this Dilemma. If he says, he intends the

definition of Religion here given, for the definition of the *Christian*, how came he to comprise all Religion, as he does in the first volume of his History, under the names of *Superstition* and *Fanaticism*? He there mentions no other species; and so great a Philosopher could not be guilty of an imperfect enumeration. If he says, he means *Natural Religion* by his definition; he only fixes the charge against him the more strongly, namely, Irreverence and contempt of Revelation.

Either way, you see, our Apologist comes off but lamely. But what then?

-- To be of no Religion

Argues a *Subtle moral Understanding*

AND IT IS OFTEN CHERISH'D. -- Thus it has been said; and I observe it for our virtuous Author's consolation, notwithstanding the ill success of his History.[29]

REMARK III.

But from his *Civil* let us return to his *Natural History*; and see how he supports his Thesis. He does it by something between history and argument. He calls it both: And You[30] perhaps will think it neither.

The belief of one God, the physical preserver but not moral Governor of the Universe is, what we have shewn our Philosopher dignifies with the title of *the primary principles of genuin Theism and Religion*. Now, if the belief of one God, a moral Governor, was prior in time to Polytheism, it will follow, that NATURALISM or the belief of one God, a Physical preserver only, is not *genuin Theism and Religion*. Because in his endeavour to prove Polytheism the first in time, he has shewn the inability of mere uninstructed man to rise up to this knowledge, on the first Essay of his Reason; the consequence of which is, that if the infant world had this knowledge, it must have been taught them by Revelation, and whatsoever is so taught, must be *true*.

But it is become the general opinion (which, though it has been a long while growing, our philosopher hopes very speedily to eradicate) that a belief of one God, the moral Governor, was the first Religion; induced thereto by the express assertion of an antient book confessedly of as good authority as any other record of very remote antiquity.

Our Philosopher's business therefore is to disprove the Fact. And how do you think he sets about it? You see there are but two ways. Either to prove *a priori*, and from the nature of things that Polytheism must be before Theism; and then indeed he may reject history and record: Or else *a posteriori*, and from antient testimony; in which case, it will be incumbent on him to refute and set aside that celebrated record which expressly tells us, Theism was the first. Our honest Philosopher does neither. He insists chiefly on antient testimony, but is as silent concerning the Bible as is no such book had ever been written.

Lord Bolingbroke, you know, before him had employed this very medium of the priority of Polytheism to Theism, to inforce the same conclusion, namely, NATURALISM:[31] but knowing better how to reason, and being perhaps at that moment less disposed to insult common sense in so profligate a manner, he labours all he can to depreciate the authority of the Bible. But our North British Philosopher despises his reader too much to stand upon Punctilios with him: he roundly affirms that all antiquity is on his side; and, as if Moses had no human authority because he allows him no divine, he will not condescend so much as to do him the honour, he has done Sanconiathon,[32] of quoting him, tho' it was in order to confute him. But you shall hear his own words, because his egregious dishonesty has led him into as ridiculous an absurdity.

As far as writing or history reaches, mankind, in antient times, appear universally to have been Polytheists. Shall we assert, that, in more antient times, before the knowledge of letters, or the discovery of any art of science, men entertained the principles of pure Theism? That is, while they were ignorant and barbarous, they discovered truth: But fell into error, as soon as they acquired learning and politeness.[33]

Shall we assert, says he. Why, no body ever asserted that Theism was before Polytheism but those who gave credit to their bible. And those who did so can easily evade his difficulty, *that it is not natural to think that before the knowledge of letters, or the discovery of any art or science men entertained the principles of pure Theism*; because this Bible tells us, that the first man did not gain the principles of pure Theism by *a knowledge of letters or the discovery of any art of science*, but by REVELATION. But this man, who had run into unlucky mistakes before concerning the state of Religion in South Britain, believed in good earnest that we had burnt our bibles, and that therefore it would be less generous to insult its ashes, than to bury them in silence. This, I think, can only account for that virtuous assurance where he says, that AS FAR AS WRITING OR HISTORY REACHES, MANKIND IN ANTIENT TIMES APPEAR UNIVERSALLY TO HAVE BEEN POLYTHEIST. And what system do you think it is, of the *origin of mankind*, which he espouses, instead of the Mosaic, to prove that Polytheism was the first Religion? No other, I will assure you, than the old Egyptian nonsense, which attempts to teach that men first started up like Mushrooms. In a word, the men on whose principles this wonderful Logician argues, never questioned the truth of his Thesis. To them therefore all this bustle of a discovery is ridiculous and impertinent. And those, who dispute the fact with him, the Religionists, he leaves in possession of all their arguments. So they laugh at it as an idle dream, raised on the absurdest of the Atheistic principles, the Epicurean.

To this ridicule the reader sees, our philosopher exposes himself, even if we believe him to be here speaking of *pure theism*, in the proper sense of the words; that is of the belief of a God, the *moral Governor of the World*. But *Ridicule* may not be all which this mighty *Theist* deserves. For what, if our Philosopher should mean by his *pure and geniun theism*, to which he denies a priority of being, his favourite NATURALISM? I should not be surprised, if he did: It is but running his *usual* philosophic course, from knavery to nonsense.

The reader, as he goes along, will see abundant reason for this charge. An Essay, then, so devoid of all manly sense, and even plausibility of reasoning, can afford a Remarker no other opportunity of entertaining the public with him, than that of drawing the picture of some of his characteristic features, some of the predominant qualities, of which he is made up. An admired Antient, I remember, has given us his opinion of this Godless Wisdom, which sets Heaven and Earth at defiance. It is according to him,

GREEK QUOTE[34]

The charge is severe; yet you have made it out, but too clearly, against this author's noble precursor in the waste spaces of Nature. I would now do as much by the disciple and follower; and to that end shall keep your example in view while I present the public with a few specimens of his philosophical virtues, his Reasoning, his Consistency, his Candour, and his Modesty; and all these promiscuously, as the rise in the natural disorder of his *Essay*.[35]

REMARK IV.

Convulsions in Nature, says he, disorders, prodigies, MIRACLES, tho' the most opposite to the plan of a wise super-intendent, impress mankind with the strongest sentiments of religion; the

causes of events seeming then the most unknown and unaccountable.[36]

Our philosopher forgets himself. He owns and admits *the plan of a wise superintendent*: this *plan* is essential to his NATURALISM. He owns and admits the actual existence of *convulsions in Nature, disorders and prodigies*: for these conform to his great principle of EXPERIENCE, his only rule of credit, and which therefore should be his rule of right. Yet these *convulsions, disorders, prodigies are*, he tells us, *most opposite to the plan of a wise superintendent*. Which in plain english is neither more nor less than, "That a wise superintendent crosses and defeats his own Plan."

You ask, how he fell into this absurdity? Very naturally. He was betrayed into it by his childish prejudice to MIRACLES: which happening to cross a hurt imagination, while he was in the neighbourhood of *Prodigies*, as Mountains and Giants always met together in the rencounters of Don Quixote, he would not let them pass without carrying with them some mark of his resentment. And having shewn, in a book written for that good purpose, that MIRACLES were *most opposite to the plan of a wise superintendent*, he was not content to brand miracles alone with this infamy, but (so dangerous it is to be found in ill company) he charges the same villany, on *Convulsions in nature, disorders and prodigies*, things in themselves very innocent, and by old experience known to have existed.

Thus a laudable zeal against his capital Enemy, MIRACLES, happening to be ill placed, this great philosophic detection of one of the prime master-wheels of superstition labours with immoveable nonsense.

REMARK V.

But now I have mentioned our Author's aversion to miracles, it may not be improper just to take notice, in passing, of that capital argument, which he and Lord Bolingbroke have borrowed from Spinoza against them.[37] "It is, that they are incredible, because contrary to all experience, and to the established course of Nature."

But is not this an admirable argument? A circumstance is urged against the reality of miracles, which must necessarily attend miracles, if there ever were any: their *essence* consisting in their being effects produced contrary to the common course of Nature; and their *end* in their being effects contrary to experience. For could they be esteemed the immediate work of the Lord of Nature, if they did not controll Nature? Or, could they be esteemed the extraordinary declaration of his will, if not contrary to our experience of the common course of Nature?

But hold a little, he will say. It is indeed of the *essence* of a miracle, that it be contrary to common experience. But for this very reason I affirm, that no miracles at all can ever be proper objects of *Belief*. For why believe an event *against* all experience, upon a testimony the credibility of which is founded *in* Experience?

Short and round, it must be owned. But, Good Sir, since you put the matter so home, one word in your ear about this same experience. To what *experience* is it that miracles are contrary? If you mean honestly and would answer to purpose, you must say, "To Experience in all SUCH CASES as those in which the existence of miracles is alledged." But what experience then do miracles contradict? Where do you find your *such cases,* in order to draw your argument from experience? In the moon, or in any other of the worlds which philosophers have found or fancied in the heavens? For in the world which we *men* inhabit I know not what *like cases* can be pretended. What then becomes of your *experience*? Or, rather how unhappy is your appeal to it, when *all* the experience, we have had, lies on the other side?

But this is only a brief hint to the wise. And our philosopher, in particular, is left to make his best of it. The reader sees, this is no time or place to pursue a consideration of such importance any further.[38]

REMARK VI.

There is a strange perversity in the arrangement of our Author's philosophical ideas, occasioned by the vain affectation of singularity.

Nothing hath been more uncontroverted, either in antient or modern times, than that the notion of the Unity, amongst the Pagans, arose from their *Philosophers*. No, says this penetrating Sage, it came from the *People*: and that by the most natural progress in the world.

> Men's exaggerated praises and compliments still swell their ideas upon them; and elevating their Deities to the utmost bounds of perfection, at last beget the attributes of UNITY and Infinity, Simplicity and Spirituality.[39]

"THE PEOPLE sure, the people are the sight."[40]

Turn this people to the South, and you see them fall down before Dogs and Cats and Monkeys. Place them to the North, and they worship stocks and stones. But give them once an Eastern aspect, and they shoot out into *praise* and *panegyric*, which presently produces a *first Cause*. It is pity but we could leave them here in quiet possession of their glory. It is not my fault that we cannot. Our Philosopher seems to be oppressed with his own discovery. Tho' the people might, in this manner, find out the *first cause*, yet he is sensible they knew not what to do with it, when they had it. They *would* not leave their false Gods for the true; they *could* not bring both to a good understanding; they had neither skill nor address to associate them together; and the true God was neither to be *praised* or *panegyrised* into an alliance with the false. What was to be done? Some philosophic fetch, much above the people, was, as he rightly observes, necessary to compleat the system of paganism. This the Philosophers performed, and finished all with a master-stroke.

> Such refined ideas, being somewhat disproportioned to VULGAR COMPREHENSION, remain not long in their original purity; but require to be supported by the notion of inferior mediators or subordinate agents, which interpose betwixt mankind and their supreme deity. These demi-gods or middle beings, partaking more of human nature, and being more familiar to us, become the chief objects of devotion, and gradually recall that idolatry, which had been formerly banished by the ardent prayers and panegyrics of timorous indigent mortals.[41]

Thus the *vulgar*, you see, in their high flights of *praise and panegyric*, rose up to the discovery of a *first Cause*; while a set of *wiser men* are called in to restore the mob of middle deities to their pristine honours: And this, to suit the objects of worship to *vulgar comprehension*.

Now shallow men, like You or me, would say, why all this bustle and the bandying about of an unjointed System? Why did not one set of workmen undertake the whole? Or, if there was need of Coadjutors, how came the parties to act in so preposterous a manner, that the people assumed to themselves what belonged to the Philosophers, the *discovery of the first cause*; and the Philosophers undertook what belonged to the people, the *discovery of demi-gods and middle beings*? Or, will he say, that the *People* did both? discovered the Unity in their blind, *timorous and indigent* state, and, when they were so well informed, struck out, in a lucky moment, their gross system of Polytheism?

He may say what he will; but nobody shall persuade me but that an Author, who makes so great a figure himself in the various walks of Philosophy, would have given the honour of the whole to is own Profession; could it have been done without dimming and impairing, in so capital a matter,

the illustrious character of an original thinker.

REMARK VII.

The Getes (says our Historian) affirmed Zamolxis their Deity to be the only true God; and asserted the worship of all other nations to be addressed to fictions and Chimaeras.[42]

This assertion contradicts all Antiquity, as well as the very nature and genius of Paganism itself. But what of that? It served an honest purpose: the purpose to which all his patriot endeavours tend, the discredit of Revelation. And on such an occasion a gratuitous assertion costs him nothing.

Now it hath been deemed one characteristic mark of favourable distinction in behalf of Revelation, that *the Jews affirmed the God of Israel to be the only true God; and asserted the worship of all other nations to be addressed to mere fictions and chimaeras*. So far was well. But then he should have taken care not to contradict himself so very soon afterwards, where speaking of the universal genius of Paganism, he tells us,

> **Idolatry is attended with this evident advantage, that by limiting the powers and functions of its deities, it naturally admits the Gods of other sects and nations to a share of divinity, and renders all the various deities, as well as rites, ceremonies or traditions, compatible with each other.[43]**

But as this observation was not his own, being stolen from a late writer on the history of Paganism, it is no wonder he should so easily forget it.

REMARK VIII.

But the Paragraph (from which the last quotation is borrowed) will afford us further matter of speculation. It contains a detailed comparison between the advantages and disadvantages of IDOLATRY and THEISM; and thus the account is stated.

POLYTHEISM or idolatrous worship, being founded entirely in vulgar traditions, is liable to this great inconvenience, that any practice or opinion, however barbarous or corrupted, may be authorized by it; and full scope is left for knavery to impose on credulity, till morals and humanity be expelled from the religious systems of mankind. At the same time, idolatry is attended with this evident ADVANTAGE; that, by limiting the powers and functions of its deities, it naturally admits the gods of other sects and nations to a share of divinity, and renders all the various deities, as well as rites, ceremonies, or traditions, compatible with each other. Theism is opposite both in its advantages and DISADVANTAGES.[44]

The advantages and disadvantages of *Polytheism* are, we see, such as arise from the *nature and essence* of idolatry. Would you not expect that the advantages and disadvantages of *theism* should have the same relation to their subject. Good logic seems to require it. But what of that, if his cause requires other management. He scruples not therefore to tell us in the same page, that the *disadvantages* here mentioned as arising from Theism, come not from the *nature* but the abuse of it. "*They arise*," says he, "*from the vices and prejudices of mankind*."

REMARK IX.

Still we are detained on the same spot; which is so fruitful of curiosities that there is no stirring from it. He is speaking of the absurdities or mischiefs, I cannot well say which, that arise from Revelation. And one, or perhaps both of these he intends to infer from the following observation.

While one sole object of Devotion is acknowledged, the worship of other deities is regarded

as absurd and IMPIOUS. Nay, this *unity of object seems naturally to require the* UNITY OF FAITH AND CEREMONIES, and furnishes designing men with a pretext for representing their adversaries as prophane, and the subjects of divine, as well as human vengeance.[45]

The calumnious insinuation, in this passage, about the origin of Persecution (the abuse, and not the reasonable consequence of a true principle) is below any body's notice. What I quote it for is a curious observation; tho' made, but on the by -- *that the unity of object seems naturally to require the* UNITY OF FAITH AND CEREMONIES.

Unity of object, says he, *seems to require unity of faith*. I am apt to think it does. For if the object of belief be single, the belief can scarce be double: unless by a drunkenness of the Understanding, like that which doubles the objects of sense. But then, *that unity of object as naturally requires unity of ceremony*, is not so clear. *Unity of faith* is necessary, because *truth*, which is the general object of faith, is but *one*. But who ever affirmed, before our author, that *unity of ceremony* was necessary? *Ceremony* is only an expression of duty: And duty may be expressed a thousand different ways. *Unity of civil obedience*, under the same government, is necessary. But is *unity of civil obeisance* to the same Governor, equally necessary?

But in the brain of this paradoxical philosopher *Faith* and *Ceremonies* seem to have changed places. We see here how he has exalted *ceremonies*. You shall see next how he degrades *faith*.

He assures us, that "the *Egyptian Religion, tho' so absurd, yet bore so great a resemblance to the Jewish that the antient Writers, even of the greatest genius, were not able to observe any difference between them*;"[46] in proof of which he quotes Tacitus and Suetonius: And then adds, "*These wise Heathens, observing something in the* GENERAL AIR *and* GENIUS *and* SPIRIT of the two Religions *to be the same*, ESTEEMED THE DIFFERENCES OF THEIR DOGMAS TOO FRIVOLOUS TO DESERVE ANY ATTENTION."[47]

These *wise Heathens* were shrewd observers. But what then becomes of the wisdom of a much greater man, our Philosopher himself? who hath assured us, that *the general air and genius and spirit of the two Religions* were so far from being the *same* that they were totally different. For speaking of Revelation and Paganism, or of Theism and Polytheism, he found this remarkable difference in *the air and genius and spirit* of the two Religions, that

> Idolatry has this evident ADVANTAGE over Theism, that by limiting the powers and functions of its deities, it naturally admits the Gods of other sects and nations to a share of divinity, and renders all the various deities, as well as rites, ceremonies or traditions compatible with each other.

-- Whereas in Theism, "While one sole object of devotion is acknowledged, the worship of other deities is regarded as absurd and impious." Nay he tells us in the same place, "That Theism is opposite to Polytheism both *in its advantages and disadvantages*."[48]

In short, in that Section nothing is alike: in the Section before us every thing is the same. So various in wisdom is antient and modern Infidelity! However a difference between the Jewish and Egyptian Religion, he owns, there was. But it was a difference only in DOGMAS TOO FRIVOLOUS TO DESERVE ATTENTION; being indeed nothing more than this, whether mankind should fall down before a dog, a cat, or a monkey, or whether he should worship the God of the Universe. From this curious specimen of our Author's ideas concerning FAITH and CEREMONIES, we cannot but conclude that he has set up for a writer against Religion, before he had learned his Catechism.

REMARK X.

> **MACHIAVEL observes, says our great Philosopher and Divine, that the doctrines of the Christian Religion, (meaning the CATHOLIC, for he knew no other) which recommended only passive courage and suffering, had subdued the spirit of mankind, and fitted them for slavery and subjection. And this observation would certainly be just, were there not many other circumstances in human society, which control the genius and character of a Religion.[49]**

***Machiavel*, says he, *meant the Catholic Religion*. That is, he meant the Roman Catholic, in contradistinction to the Gospel. Machiavel meant no such thing. If he had, the *super-subtile Italian* had wrote like this rambling North-Briton. For it is not the Catholic Religion, so distinguished, but the Gospel itself which gave libertine men the pretence of saying, that *it subdued the spirit of mankind, and fitted them for slavery and subjection*. but here a sudden qualm comes over our Philosopher. He was ashamed of saying this of the Gospel. And well he might. For, tho' he says, *the observation is certainly just*, there never was a ranker calumny. The Gospel recommends no such thing as *passive courage and suffering*, either with regard to the domestic invaders of our civil rights, or to the foreign enemies of our country: And there are but one or two illiterate and fanatic sects, of very small extent, in the whole Christian world, who have so understood and abused the Gospel. The only *passive courage and suffering it recommends* is to particulars, whose consciences civil society hath iniquitously violated. Now, if instead of this *passive courage and suffering* the Gospel had recommended to its private followers to fly to arms and repel the force of the civil magistrate, when he abused his authority, in suppressing truth and the rights of conscience, what tragical exclamations would these very men have raised against the factious spirit of Christianity? Indeed, to our Author's shame be it spoken, the very contrary of all this is the truth. The effects of the Gospel are most salutary to *human Society*: for by encouraging inquiry and by inspiring a spirit of liberty in religious matters, it naturally inclines its followers to carry the same dispositions, into Civil.**

REMARK XI.

But this honest man can allow himself, on all occasions, to calumniate the Religion of his country: sometimes openly and grossly; but oftner, as in the following instance, in the oblique way of Insinuation only.

> **Were there a Religion (*and we may suspect Mahometanism of this inconsistence*) which sometimes painted the deity in the most sublime colours, as the creator of heaven and earth: sometimes degraded him nearly to a level *with human creatures in his powers and faculties*; while at the same time it ascribed to him *suitable infirmities, passions and partialities of the moral kind*: That Religion, *after it was extinct*, would also be cited as an instance of those contradictions, which arise from the gross, vulgar, natural conceptions of mankind, opposed to their continual propensity towards flattery and exaggeration. Nothing indeed would prove more strongly the divine origin of any Religion, than to find (*and happily this is the case with Christianity*) that it is free from a contradiction so incident to human nature.[50]**

We see what the man would be at, thro' all his disguises. And, no doubt, he would be much mortified, if we did not; tho' the discovery, we make, is only this, That, of all the slanders against Revelation, this before us is the tritest, the dirtiest and most worn in the drudgery of Freethinking. Not but it may pass with his friends. And they have my free leave to make their best of it. What I quote it for is only to shew the rancour of heart which possesses this unhappy man, and which could induce him to employ an insinuation against the Jewish and Christian Religions; not only of

no weight in itself, but of none, I will venture to say, even in his own opinion.

REMARK XII.

The learned, philosophical Varro (says our no less learned and philosophical Naturalist) discoursing of Religion, pretends not to deliver any thing beyond probabilities and appearances: Such was his good sense and moderation! But the passionate, the zealous Augustin insults the noble Roman on his scepticism and reserve, and professes the most thorough belief and assurance. A Heathen poet, however, contemporary with the Saint, ABSURDLY esteems the religious system of the latter, so false, that even the credulity of children, he says, could not engage them to believe it.[51]

From the fact, as here delivered, we learn, that the Pagans insulted the Christians, and the Christians the Pagans, for the supposed absurdity of each others system. Agreed. And what then? Were their several systems equally absurd? This is what he would insinuate, or his observation is impertinent. Yet does not Mr. David Hume insult the *Religionists*, as absurd; They, him, as ten times more absurd? Will he say, that He and they have equal reason? But what, in the mean time, becomes of *Naturalism*? We must conclude then, that it is possible, one party may be in the right and the other in the wrong. The consequence is, that his approbation of Varro, and his censure of Augustin, is temerarious and unjust. For what hinders but that Augustin's *thorough belief and assurance* might be full as reasonable when he defended Christianity, as Varro's not venturing *beyond probabilities and appearances*, when he apologized for Paganism? Had our modern Philosopher, who has a much worse cause than Varro's to defend, but imitated Varro's *moderation*, which he commends, instead of Augustin's *thorough assurance*, which he condemns, his reader perhaps would have thought better both of his sense and honesty. -- Oh, but for his honesty and impartial indifference between Christianity and Paganism, he has given us such a convincing proof in this very instance, that he ought ever hereafter to go scot-free. We have observed, that he has praised Varro and condemned Augstin: but to shew -- Tros Rutulusve fuat[52] -- he tells us honestly -- *that a Heathen poet, however, contemporary with the Saint*, ABSURDLY *esteems the religious system of the latter* [i.e. Christianity] *so false, that even the credulity of children*, he says *could not engage them to believe it*. Now here, where he has been at the expence of so much fair dealing, he ought to be indulged in rewarding himself for it, which he has done in this modest insinuation, that Christianity was so false and nauseous that even children could not be brought to swallow it.

He may talk what he pleases of the *absurdity* of poets. But while one Philosopher lives, I defy all the poets of antient or modern date to equal him either in absurdity or fiction. The poet, he here abuses, is CLAUDIUS RUTILIUS NUMATIANUS. He tells You, how this poet reviles Christianity: and quotes the Poem, the book, and the page. Would you suspect all this to be a flam, and not one word of truth, from beginning to end? Yet so it is. Rutilius is speaking of a JEW, by name and title; and the Rites of *Judaism*, as they distinguish that Religion from all other, are the subject of his Satire. The whole passage is as follows.

-- Namque loci querulus curam JUDAEUS agebat;

***Humanis* animal dissociale *cibis*.**

Vexatos frutices, pulsatas imputat algas,

Damnaque libatae grandia clamat aquae.

Reddimus obscaenae convicia debita genti,
Quae *genitale caput propudiosa metit*:

Radix stultitiae, cui frigida *sabbata* cordi;
Sed cor frigidius religione sua est.

Septima quaeque dies turpi damnata veterno,
Tanquam lassati mollis imago Dei.

Cetera mendacis deliramenta catastae,
Nec pueros omnes credere posse reor.[53]

The Pagan writers indeed frequently confound the two sects of Judaism and Christianity, with one another. But here, there is not the least room for that poor subterfuge. Rutilius speaks of Judaism by name: and to shew us that he understood his subject, he reviles it for those very rites, which are peculiar to Judaism; namely, the distinction between *clean and unclean meats, circumcision*, and the *Sabbath*. Yet, if You will believe this honest man, Rutilius represents CHRISTIANITY as so false, that even the *credulity of children could not engage them to believe it.* And why should You believe him?[54] He is a Philosopher, a follower of truth, and a virtuous man: One, (as he says of himself) *whose errors should be excused,* ON ACCOUNT OF THE CANDOUR AND SINCERITY WHICH ACCOMPANIES THEM.[55]

REMARK XIII.

If ever there was a nation or a time (says our Philosopher) in which the public religion lost all authority over mankind, we might expect, that infidelity in *Rome*, during the *Ciceronian* age, would openly have erected it's throne, and that Cicero himself, in every speech and action, would have been its most declared abettor. But, it appears, that, whatever sceptical liberties that great man might use, in his writings or in philosophical conversation; he yet avoided, in the common conduct of life, the imputation of DEISM and PROFANENESS. Even in his own family, and to his wife, *Terentia*, whom he highly trusted, he was willing to appear a devout religionist; and there remains a letter, addrest to her, in which he seriously desires her to offer a sacrifice to *Apollo* and *AEsculapius*, in gratitude for the recovery of his health.[56]

Here he seems to commend Cicero (for his vanity, perverseness, and love of paradox make him always think at large, and write at random) on a topic which exposes his own wicked practice, namely, Cicero's care, *in the common conduct of life*, to set the people an example of reverence for the established Religion. But whether this was said in praise or dispraise of that noble Roman, it matters not, since presently after he contradicts his own account, and assures us that the same Cicero was so far from *avoiding, in the common conduct of life, the imputation of* DEISM *and* PROFANENESS, that *He made no scruple in a public court of Judicature, of teaching the doctrine of a future state, as a* MOST RIDICULOUS FABLE, *to which no body would give any attention*.[57] And this without the least care of reconciling Cicero, to himself; or his own contradictory observations, to his reader.

REMARK XIV.

But he treats whole Bodies of men no better than Particulars.

We may observe (says he) that, notwithstanding the dogmatical, imperious style of all

> superstition, the conviction of the Religionist, in all ages, is more affected than real, and scarce ever approaches, in any degree, to that solid belief and persuasion, which governs us in the common affairs of life. Men dare not avow, even to their own hearts, the doubts, which they entertain on such subjects: they make a merit of implicite faith; and disguised to themselves their REAL INFIDELITY, by the strongest asseverations and most positive bigotry. But nature is too hard for all their endeavours, and suffers not the obscure, glimmering light, afforded in those shadowy regions, to equal the strong impressions, made by common sense and by experience. The usual course of men's conduct belies their words, and shews, that the assent in these matters is some unaccountable operation of the mind betwixt disbelief and conviction, but approaching much nearer the former than the latter.[58]

This is superlatively modest. -- When the Religionist says that an infidel writer, (like this man) in order to skreen himself from the resentment of the Law, says one thing and thinks another, there is no end of the clamours raised against uncharitable Churchmen. But Mr. David Hume may say all this and more of Religionists, and yet preserve his character of a philosopher and a friend of Truth. But infidelity owed him a shame, and he presently unsays it all; and confesses that Religionists are so far from being tossed about in *doubt* and *unbelief*, that nothing is more constant than the course of even the wisest and most experienced of them, invariably steady to the point of faith. For after having said a great deal to shew that Socrates and Xenophon did in reality give credit to Augurs and Omens, he concludes thus,

> It is for the same reason, I MAINTAIN, that Newton, Locke, Clarke, &c. being Arians or Socinians, were VERY SINCERE, in the creed they professed: and I ALWAYS OPPOSE THIS ARGUMENT to some Libertines, who will needs have it, that it was impossible but that these great Philosophers must have been HYPOCRITES.[59]

Our modest philosopher had employed the 83d page of this wonderful essay to prove, that notwithstanding *the dogmatical imperious style of all superstition*, yet Religionists are HYPOCRITES; *their conviction in all ages being more* AFFECTED *than* REAL: and a great deal more trash to the same purpose. Yet here in the 91st page he MAINTAINS *against Libertines*, that these Religionists are VERY SINCERE, and no Hypocrites. Nay, in spite, as it were, to his 83d page, he affirms that he ALWAYS *opposes this argument to libertines*.

But are you to think, he talks thus wantonly, for no other end than to shew his contempt of the reader? By no means. For tho' this be, sometimes, motive sufficient for our paradoxical Gentleman to *contradict*, yet we must needs think there was some important occasion which induced him thus *to give the lye to himself*. He had it in his choice (for what hindered him, when unrestrained by the considerations of truth or falshood) to represent the Religionists as either KNAVES or FOOLS. But this did not content his noble passion for mischief. He would have them BOTH. Unluckily this could not be done without a contradiction. To make them *Knaves*, he was to shew they professed one thing and believed another: to make them *Fools*, they were to be represented as *steadily* and *sincerely* believing all things. The contradiction, we see, was unavoidable: but how he came so needlessly to saddle himself with the *lye* -- *I* ALWAYS, says he, *oppose this argument to libertines* -- I confess surpasses my comprehension.

Well, having floundered so shamefully, he is for recovering himself; and therefore stops into the gap, between these two extremes, a moderating tenent; and so leaves all Religionists, both antient and modern, in a kind of MIDDLE STATE, between *Knaves* and *Fools*. His conciliating tenent, is this

--

> In the meantime it is obvious, that the empire of all religious faith over the understanding is wavering and uncertain, subject to all varieties of humour, and dependent on the present incidents, which strike the imagination. The difference is only in the degrees. An ancient will place a stroke of impiety and one of superstition alternately through a whole discourse: A modern often thinks in the same way, tho' he may be more guarded in his expressions.[60]

I am so tired with his contradictions that I shall let this passage go, unexamined upon that head, notwithstanding it looks so asquint both to the right and left, and agrees neither with the thorough *Hypocrisy*, nor the *sincere belief* of the two passages, it is brought to reconcile. But, as it stands alone, I may be allowed to ask, Why is the *modern* Christian *more guarded in his expressions*, than the *antient* Pagan? Does not human nature always operate alike in the like circumstances? If therefore, in this *modern superstition*, called *Christianity*, men are more consistent in the profession of their belief, than in that *antient superstition*, called Paganism, does not this shew that the circumstances were not alike? And what other differences in circumstances could there be, if not this, that Christianity having a rational foundation, it's professors stood steady and unmoved; and Paganism only fluctuating in the fancy and unsupported by the understanding, communicated the same inconstancy and variableness to its followers?

Oh, but says our Philosopher, I will not allow that steadiness to be more than pretended, *A modern often thinks in the same way*, [i.e. inconstantly,] *tho' he may be more guarded in his expressions*. How prejudiced! what pretence has he to suppose it an *inconstancy*, only *guarded in the expression*, when the very uniformity of the profession excludes all data whereon to ground his suspicion that the belief is only pretended?

He must take it then for granted (as without doubt he does) that Christianity has no more reasonable foundation than Paganism. No need, will he say, of that, at present. The *fashion*, the fashion, does all. An unsteadiness in Religion is discreditable in these *modern* times: hence the *guarded expression*.

Well, admit it to be so. What, I pray you, made unsteadiness in Religion now discreditable, which was creditable in former times, but this, that Christianity has now the support of, at least, plausible arguments, which Paganism never had?

REMARK XV.

In comparing the two Religions, Paganism and Christianity, our philosopher finds that the former is to be preferred to the latter, both in it's REASONABLENESS and in its BENEVOLENT SPIRIT.

Upon the whole, the greatest and most observable differences betwixt a *traditional mythological* religion, and a *systematical, scholastic* one, are two: The former is often more REASONABLE, as consisting only of a multitude of stories, which however groundless, imply no express absurdity and demonstrative contradiction; and sits also so easy and light on mens minds, that tho' it may be as universally received, it makes no such deep impression on the affections and understanding.[61]

The *reasonableness*, we see, is resolved into this, that You cannot reduce the Professors of Paganism to *an express contradiction*; and that the Profession *sits mighty light and easy on men's minds*. As to the first property of paganism, its incapacity of being reduced to a contradiction, this it has in common with NONSENSE, which is likewise incapable of suffering the same disgrace. And

this will account too for its second property, the *sitting so light and easy on the minds of men*. For nothing takes less hold of the mind than NONSENSE, or so little disturbs its tranquility, while we have the discretion to take it for what it is. To this he will tell you, you mistake his aim, if you think it was to credit paganism: the comparison was made only to discredit Christianity; by insinuating that its DOGMAS are *contradictory*, and its SANCTIONS *oppressive*.

As to the superior BENEVOLENCE in the spirit of Paganism, this is made out as follows.

Lucian observes, that a young man, who reads the history of the Gods in *Homer* or *Hesiod*, and finds their factions, wars, injustices, incest, adultery, and other immoralities so highly celebrated, is much surprized afterwards, when he comes into the world, to observe, that punishments are by Law inflicted on the same actions, which he had been taught to ascribe to superior beings. The contradiction is still perhaps STRONGER betwixt the representations given us by some latter Religions and our natural ideas of generosity, lenity, impartiality, and justice; and in proportion to the multiplied terrors of these religions, the barbarous conceptions of the divinity are multiplied upon us.[62]

You, Sir, who took your idea of the DII MAJORUM GENTIUM[63] from ancient story, seem not to have characterised them amiss where you call them,[64] "*a rabble of Tyrants, Pathics, and Adulterers, Whores, Vagabonds, Thieves, and Murderers*."[65] Yet, gracious Heaven! a Philosopher of the North Britain, in the Reign of George the Second, has dared to tell us, with very little disguise, that *the barbarous conceptions of the divinity, multiplied upon us* by Christianity, are still more *contradictory to our natural ideas of generosity, lenity, impartiality, and justice*.

But here his *modesty* seemed to labour a little; and he is for casting part of the odium of this diabolic insinuation, from himself upon another.

> But in order, says he, to shew more evidently, that it is possible for *a Religion* to represent the Divinity in a still more immoral, unamiable light than the antient, we shall cite a long passage from an author of TASTE and IMAGINATION, who was surely no enemy of Christianity.[66]

You will suspect him to be just on the point of playing you a trick when you hear him talk of his authority, as an author of *taste and imagination*, when the subject requires that the voucher for it should have a clear judgment and strong understanding. After all there was no occasion for this slight of hand. The trick, I speak of, is to be played, as you will find, not by this *man of taste*, but by our Philosopher himself. His voucher, the Chevalier Ramsey, is perfectly innocent of all our Philosopher brings him to attest.

The words just quoted plainly imply, that in the opinion of this *man of taste*, Revelation, or the Jewish and Christian Religion, as delivered in the Bible, *represents the divinity in a still more immoral and unamiable light than the antient. -- It is possible*, says he, *for a* RELIGION -- which, I think, implies the Religion itself, and not the superstitious followers, much less the professed enemies of it. Turn now to the *long passage*, which this *man of truth* has quoted in his 100th page, and you will find that this *immoral and unamiable light in which the divinity is represented*, is not the representation of the Religion itself, but of its false friends and open enemies.

> What strange ideas (says the Chevalier Ramsey) would an Indian or a Chinese Philosopher have of our holy Religion, if they judged by the schemes given of it by our MODERN FREE-THINKERS and PHARISAICAL DOCTORS OF ALL SECTS? According to the odious and too vulgar system of these INCREDULOUS SCOFFERS and CREDULOUS SCRIBLERS, the God of the Jews is a most cruel, unjust, partial, and fantastic Being. --

> **To accomplish the partial, barbarous decree of predestination and reprobation, God abandoned all nations to darkness, idolatry, superstition, &c.**

This turns out ridiculous enough. The Chevalier Ramsey is brought to prove that the Bible *represents the Divinity in a more immoral and unamiable light than Paganism*: and the Chevalier Ramsey turns the tables on him and proves that they are only such as our Philosopher himself and his crew, who so represent the Divinity.

Well, but say you, the Chevalier Ramsey is made by our Philosopher to consider the *representation* as the representation of Revelation, whoever made it. The *man of Truth's* words are these -- *To shew more evidently that it is possible for a Religion to represent, &c. we shall cite a long passage from an author, who was surely no enemy to Christianity*. Why were these last words added but to insinuate that the representation, however disadvantagious, was yet owned to be a true one; unwillingly perhaps, as he was a friend of Christianity, but from the mere force of evidence. Whereas turn but your eyes upon the *long passage* and you will find that the representers, the *free-thinkers* and *Pharisaical Doctors*, are heartily censured by the Chevalier for thus *disfiguring* and *dishonouring* Revelation. His concluding words are,

> **Thus the *incredulous free-Thinkers*, the *Judaizing Christians*, and the *fatalistic Doctors*, have disfigured and dishonoured the sublime mysteries of our holy faith; thus they have confounded the nature of good and evil; transformed the most monstrous passions into divine attributes, and SURPASSED THE PAGANS IN BLASPHEMY, by ascribing to the eternal nature as perfections, what makes the horridest crimes amongst men.[67]**

The sum is this. The *man of truth* calls upon the *man of taste* to prove that the Jewish and Christian religions, as they lye in the bible, *represents the divinity in a more immoral and unamiable light than Paganism*. And the *man of taste* bears evidence that it is not the Bible but the *man of truth* and his crew who give this representation of the Divinity: a representation which SURPASSES indeed the very PAGANS IN BLASPHEMY.

REMARK XVI.

We now come to his account of the origin of that Religion, of which, meaning *Superstition*, he pretends to give a natural History.

The primary religion of mankind arises chiefly from an anxious fear of future events; and what ideas will naturally be entertained of invisible unknown powers, while men lie under dismal apprehensions of any kind, may easily be conceived. Every image of vengeance, severity, cruelty, and malice must occur and augment the ghastliness and horror, which oppresses the amazed religionist. A panic having once seized the mind, the active fancy still farther multiplies the objects of terror; while that profound darkness, or, what is worse, that glimmering light, with which we are invironed, represents the spectres of divinity under the most dreadful appearances imaginable. And no idea of perverse wickedness can be framed, which those terrified devotees do not readily, without scruple, apply to their deity.

This appears the natural state of religion, when surveyed in one light. But if we consider, on the other hand, that spirit of praise and eulogy, which necessarily has place in all religions, and which is the consequence of these very terrors, we must expect a quite contrary system of theology to prevail. Every virtue, every excellence must be ascribed to the divinity, and no exaggeration be esteemed sufficient to reach those perfections, with which he is endowed. Whatever strains of

panegyric can be invented, are immediately embraced, without consulting any arguments or phaenomena. And it is esteemed a sufficient confirmation of them, that they give us more magnificent ideas of the divine object of our worship and adoration.

> HERE therefore is a kind of contradiction betwixt the different principles of human nature, which enter into Religion. Our natural terrors present the notion of a devilish and malicious deity: Our propensity to praise leads us to acknowledge an excellent and divine. And the influence of these opposite principles are various, according to the different situation of the human understanding.[68]

Thus has this wretched man misrepresented and calumniated those two simple principles, which under the guidance of natural light led the people to a deity and kept him always in sight, namely FEAR, and LOVE. A man less maliciously disposed to abuse and slander human nature, would have fairly told us, that FEAR kept the Religionist from evil, as a thing offensive to the deity; and that LOVE inclined him to virtuous practice, as most acceptable to the divine nature. No, says this accuser of his Kind, FEAR presented the Religionist *with the notion of a devilish and malicious deity: and* LOVE *exaggerated the perfections of the deity, without consulting any arguments or phaenomena*: i.e. arguments or phaenomena, which might have convinced him that they were *exaggerations*. Whereas the truth of the case is merely this; whenever simple nature did not work by *fear* and *love*, to avoid evil and to follow good, but instead of that to invent a *fantastic*, or a *diabolic* deity, the impediment was accidental, occasioned by the intervention of some unhappy circumstance foreign to the natural workings of the human mind.

REMARK XVII.

> It is remarked by Xenophon (says our Philosopher) in praise of Socrates, that that philosopher assented not to the VULGAR opinion, which supposed the Gods to know some things, and be ignorant of others: He maintained that they knew every thing, which was done, said, or even thought. But this was a strain of philosophy much above the conception of his countrymen.[69]

This is pleasant. It is but in the foregoing page, he assures us, that not only the *Vulgar* of Greece, but the *Vulgar* of all the world knew that their Gods *were ignorant of nothing*. His words are these. *If we consider that spirit of praise and eulogy*, WHICH NECESSARILY HAS PLACE IN ALL RELIGIONS, *we shall find that every virtue, every excellence must be ascribed to the divinity, and* NO EXAGGERATIONS BE ESTEEMED SUFFICIENT TO REACH THOSE PERFECTIONS, *with which he is endowed*. Now is not OMNISCIENCE a PERFECTION? And was not the spirit of exaggeration, which never thought it said enough, able to reach the idea of *knowing all things*? How happened it then that this exaggerating mob of Religionists wanted a Socrates to tell them, that *the Gods not only knew some things, but all things*? But the man has got his readers, and he uses them as they deserve.

REMARK XVIII.

But now for a discovery indeed. --

> As men further EXALT the idea of their divinity; it is often their NOTION OF HIS POWER AND KNOWLEDGE ONLY, NOT OF HIS GOODNESS, which is improved. On the contrary, in proportion to the supposed extent of his science and authority, their terrors naturally augment.[70]

This is hard. Common sense seems to tell us so much of our common nature, that the *spirit of love*, which is ever *for exalting further and further the idea of* its object, is chiefly delighted in dwelling on

the GOODNESS of that object: as *fear* is most conversant in the divine attributes of *power and knowledge*. But this sublime philosopher has discovered that both we and nature are mistaken; and that, *as men further exalt the idea of their divinity, it is often their notion of power and knowledge, not of his goodness*, that is improved. And his kind reader might be disposed perhaps to take his word, but that he sees it contradicts, in express terms, what he had said but two or three pages before: Where he as magisterially assures us, that *a spirit of praise and eulogy makes men ascribe every virtue, every excellence to the Deity, and to* EXAGGERATE THEM ALL: Therefore, I should suppose, GOODNESS, along with the rest.

REMARK XIX.

After all these feats, he will now account how it happens that Religionists are so generally disposed to prefer rites and positive institutions, to morality and natural duties. And the secret is revealed in this manner:

Perhaps, the following account may be received as a true solution of the difficulty. The duties, which a man performs as a friend or parent, seem merely owing to his benefactor or children, nor can he be wanting to these duties, without breaking thro' all the ties of nature and morality. A strong inclination may prompt him to the performance: A sentiment of order and moral beauty joins its force to these natural ties: And the whole man, if truly virtuous, is drawn to his duty, without any effort or endeavour. Even with regard to the virtues, which are more austere, and more founded on reflection, such as public spirit, filial duty, temperance, or integrity; the moral obligation, in our apprehension, removes all pretence to religious merit; and the virtuous conduct is esteemed no more than what we owe to society and to ourselves. In all this, a superstitious man finds nothing, which he has properly performed for the sake of his deity, or which can peculiarly recommend him to the divine favour and protection. He considers not, that the most genuin method of serving the divinity is by promoting the happiness of his creatures. He still looks out for some more immediate service of the Supreme Being, in order to allay those terrors, with which he is haunted.[71]

It is to be lamented that but just before he had proved all this fine reasoning not worth a rush, where he confesses *that there are popular Religions, in which it is expressly declared that nothing but morality can gain the divine favour*.[72] For, if those who prefer rites to moral duties, are yet taught by their Religion that *nothing but morality can gain the divine favour*, it is plain, his solution can have no place, which is that superstitious men give that unjust preference, *because they can find nothing in morality which can peculiarly recommend them to the divine favour*. Had he not therefore done better, as in the former instance of *the genius of Paganism*, to have stolen his solution? He has not boggled at greater matters. And a Philosopher, who deserves no quarter from him, might have saved his credit, and been pillaged with advantage.

Next to the knowledge of one God, says this excellent man, a clear knowledge of their duty was wanting to mankind. This part of knowledge, tho' cultivated with some care by some of the Heathen philosophers, yet got little footing amongst the people. The priests made it not their business to teach men virtue. If they were diligent in their observations and ceremonies; punctual in their feasts and solemnities, and the tricks of religion, the holy tribe assured them, the Gods were pleased, and they looked no farther. Few went to the schools of the philosophers to be instructed in their duties, and to know what was good and evil in their actions. *The Priests sold the better penny-worths, and therefore had all their custom. Lustrations and processions were much easier than a clean conscience, and a steady course of virtue; and an expiatory sacrifice, that attoned*

for the want of it, was much more convenient than a steady course of virtue.[73]

This is the solution of a philosopher indeed; clear, simple, manly, rational, and striking conviction in every word; unlike the refined and fantastic nonsense of a writer of Paradoxes.

But then don't imagine that our author was not aware of this solution. No, he despised it because it was so reasonable. For he thinks to obviate it by saying, "That it is not satisfactory to allege that the practice of morality is more difficult than that of superstition; *and is therefore rejected*."[74] *But how does he make out this point? Why, by giving us to understand that the four Lents of the Muscovites, and the austerities of some Roman Catholics, appear more disagreeable than* MEEKNESS AND BENEVOLENCE. Let him say, as Mr. Locke does, honestly -- than a STEADY COURSE OF VIRTUE. And we shall better judge whether *these austerities* be indeed more difficult than *such* a morality.

REMARK XX.

Well, but he makes ample amends for the slight here shewn of STEADY VIRTUE. For, as a supplement to his account of this mysterious phaenomenon,

> We may add, says he, that even after the commission of crimes, there arise remorses and secret horrors, which give no rest to the mind, but make it have recourse to religious rites and ceremonies, as expiations of its offences. Whatever weakens or disorders the internal frame promotes the interests of superstition: AND NOTHING IS MORE DESTRUCTIVE TO THEM THAN A MANLY STEADY VIRTUE, which either preserves us from disastrous melancholly accidents, or teaches us to bear them.[75]

We may add, says he. That he may safely, whatever he pleases; who has a public to deal with so easily bubbled into the opinion of his being a philosopher. Which makes me the more wonder at the trouble his friends gave him, of refining this *natural history* from the grosser faces[76] of Atheism, before it was presented to the world.[77] But this public, it seems, was become a little squeamish, having been so lately overdosed by the quackery of Bolingbroke.[78]

NOTHING, says our philosopher, IS MORE DESTRUCTIVE TO THE INTEREST OF SUPERSTITION, THAN A MANLY STEADY VIRTUE: Which in plainer English is, "None will be so free from Superstition as the most hardened Rogue." For the fact, from which he deduces this proposition, is this, *That after the commission of crimes, there arise remorses and secret horrors, which make men have recourse to expiatory rites. These remorses,* BY WEAKENING AND DISORDERING THE INTERNAL FRAME, *promote superstition*. Now the country state of this internal frame can be no other than such as enables us to bear the retrospect of our rogueries without *remorse and horror*: this he calls *a manly steady Virtue*. Do I wrong him? Let his friends judge. Had he meant, by *manly steady virtue* what common moralists so call, he must have told us, that this *Virtue* produced in the offender, reparation of injuries and amendment of life; things, in reality, *most destructive to the interests of superstition*. Whereas the *manly steady virtue* of our philosopher does no more, by his own confession, than *either preserve us from disastrous melancholly accidents* [i.e. keep us from hanging ourselves] *or teaches us to bear them* [i.e. to recall to memory our past crimes without remorse.] And this, hardened roguery, and nothing but hardened roguery is capable of atchieving. Or, will he, to save himself from this atrocious charge, say, that by a *manly steady virtue* he meant such a *Virtue* as *prevents* the commission of crimes? This had been to the purpose. But let him then shew us how this meaning is to be gathered from his *expression*. To say the least, if, in excess of candour, one must suppose him to have *meant well*, no well-meaning philosopher ever expressed

himself so wretchedly.

REMARK XXI.

You have here, Sir, what I promised You; a specimen of his philosophic virtues, his reasoning, his consistency, his knowledge, his truth, his candour and his modesty, as they promiscuously appear in the NATURAL HISTORY OF RELIGION.[79] I have hunted him from track to track. And now what thick cover, do You suppose, has he chosen to skreen himself from the public contempt? He takes shelter in the dark umbrage of SKEPTICISM. These are his concluding words.

> **The whole is a riddle, an aenigma, an inexplicable mystery. Doubt, uncertainty, suspence of judgment appear the only result of our most accurate scrutiny, concerning this subject. But such is the frailty of human reason, and such the irresistible contagion of opinion, that even this deliberate doubt could scarce be upheld; did we not enlarge our view, and opposing one species of superstition to another, set them a quarreling; while we ourselves, during their fury and contention, happily make our escape, into THE CALM, THO' OBSCURE, REGIONS OF PHILOSOPHY.**

Thus, we see, his last effort is to defend his *dogmatical* nonsense with *scepticism* still more nonsensical. Nor to this, neither, dares he trust himself: but presently meditates an *escape*, as he calls it, by setting the *Religionists a quarreling*: without which, he frankly owns, that *deliberate doubt could scarce be upheld*. For the sake of this beloved object, DELIBERATE DOUBT, there is no mischief he is not ready to commit, even to the unhinging the national Religion, and unloosing all the hold it has on the minds of the people. And all this for the selfish and unnatural lust of *escaping* from right reason and common sense, *into the calm, tho' obscure regions of philosophy*. But here we have earthed him; rolled up in the Scoria of a *dogmatist* and *Sceptic*, run down together. He has been long taken for a Philosopher: and so perhaps he may be found -- like Aristotle's statue in the Block.

> **Then take him to devellop, if you can,**
>
> **And hew the block off, and get out the Man.[80]**

CONCLUSION.

I have now done with my Philosopher; and, whatever his admirers may think, You, Sir, I persuade myself, will be of opinion that I have treated him but as he deserves. If indeed my purpose had been only to disgrace the *man*, the very recital of his impieties had been sufficient. But finding, that he had somehow usurped to himself the name of *Philosopher*, I thought it not amiss, as occasion offered, to expose his bad logic; and above all to point out to the reader his numerous *inconsistencies and contradictions*. I can readily believe, however, he will be the first to divert himself with this part of my pains. He, who thinks at large, is enslaved to no principles, nor acknowledges any, what should hinder him from writing with as little regard to *truth*, as to Religion? He leaves it, no doubt, to the Religionists to shackle themselves in CONSISTENCY? What is it to him, a free-thinker and a sceptic, whether what he says in one page be of a piece with what he delivers in another?

Well, but this is the feature, of all others, in his philosophical countenance, which I was most ambitious of catching, and presenting to the view of the public. For that public, I would hope, is even yet not so thoroughly abandoned, as to contemplate this profligacy of mind, indifferent to truth and falshood, and which is ready, on all occasions, to neglect common honesty and insult common Sense, without horror. And what so likely way of discrediting such a writer with the people, as to let them see what a conductor they have taken to themselves in philosophy and

religion?

In the mean time how miserable is the condition of depraved humanity! Heaven sends us into life with the seeds and principles, at least, of integrity and honesty. The vulgar of all denominations presently lose these virtues, in the commerce of the WORLD. And the men of science, in the SCHOOLS: The consequence is, A *practice*, void of MORALITY; and a *speculation*, unawed by TRUTH. In this scene of things the good man applies himself to reform the one, and instruct the other: Both, I am afraid, as the Patriarch believed, *against hope*. Yet this does not lessen the merit of his intended services. My concern is only, how they may become effectual. And if there be a way left, it is surely that which you have hitherto taken, "of disgracing every licentious shallow scribler; that dishonours the name of letters, by writing the abused public into an opinion of his being a philosopher."

Hence it is, that CHUBB, MORGAN, COLLINS, MANDEVILLE and BOLINGBROKE are names, which nobody hears, without laughing. It is not for me, perhaps, to predict the fate of Mr. DAVID HUME. But if You, Sir, had taken upon You to read his destiny, the public had, now, seen this Adorer of *Nature*, this *last* hope of his declining family, gathered *to the dull of ancient days*;

"Safe, where no critics, no divines molest,

"Where wretched TOLAND, TINDAL, TILLARD rest."

I am, with due respect,

SIR, &*c*. FINIS.

Remarks Upon The Natural History Of Religion By Mr. Hume

Thomas Stona

1758

Editor's note: Thomas Stona's *Remarks upon the Natural History of Religion* was published anonymously; authorship is attributed to him in John Nichols's *Literary Anecdotes*, (London: 1812), Vol. 2, 717. Little is known of Stona's life other than the fact that he is the author of *A Letter to the Norfolk militia, upon the proceedings of ancient nations when engaged in war. Bu a dumpling-eater...* (London: M. Cooper, 1759). The full title of the *Remarks* is *Remarks upon the Natural History of Religion by Mr. Hume. With Dialogues on Heathen Idolatry, and the Christian Religion*. Accordingly, the work is divided into three sections: "Remarks on the *Natural History of Religion*" (pp. 1-27), "On Idolatry, a Dialogue" (pp. 27-106), and "Dialogue on the Christian Religion" (pp. (106-159). Only the first of these three sections is reprinted below. The first section of the *Remarks* defends the position of original monotheism and attacks Hume's claim that primitive humans were too unsophisticated to deduce monotheism from nature. The second section, "On Idolatry" examines the causes of idolatry; Hume's name appears only incidentally in this section. The third section, "A Dialogue on the Christian Religion" defends Christian revelation, and briefly discusses Hume's argument against miracles (pp. 120-133) concluding "that neither the impossibility of the miracles being wrought can be proved, or their evidence confuted; and consequently no reason can be given, why we should not believe in the truth of them, notwithstanding the conclusions that are drawn from these formidable arguments of *experience* to the contrary." William Rose writes in the *Monthly Review* that,

> **The Author of these Remarks, &c. appears to be a friend to religion and freedom of enquiry; but he has advanced nothing, in our opinion, that can give the judicious reader any high idea of his discernment or acuteness. His remarks upon Mr. Hume's Natural History of Religion are extremely superficial, and scarce contain any thing that deserves particular notice. [1758, Vol. 19, pp. 532-533].**

The *Critical Review* devotes a full review article to Stona's *Remarks*. They describe at length

Hume's abilities and how Hume is "more admired, more opposed, and more misrepresented" than most writers. Stona's work is recommended "as a work of learning, taste, and merit... [although] without, perhaps, the strongest powers of the discussive faculty." Concerning Stona's main argument against Hume, the reviewer observes "that Mr. Hume seems to attribute too much to the cultivation of the mind, and our author too little; both in extremes" (1758, Vol. 6, pp. 411-418). The following is from pages 1-27 of the 1758 and only edition of Stona's *Remarks*. Stona's bibliographical references to Greek and Latin classics and seventeenth and eighteenth-century works have been expanded and clarified without brackets in the notes.

REMARKS
UPON THE
Natural History of Religion
By Mr. HUME.
With DIALOGUES on
HEATHEN IDOLATRY
AND THE
CHRISTIAN RELIGION

REMARKS
UPON THE
Natural History of Religion.
LETTER to Theophilus

I HAVE lately met with a treatise entitled, *The Natural History of Religion*, in which the author proposes to enquire into the primary religion of mankind upon the principles of reason, unassisted with revelation, and has produced a series of arguments to prove that it was polytheism. I do not pretend to be a judge of the merits of this performance; but must confess, that the air of freedom which enlivens every part of it, delighted {2} me extremely. You know, Theophilus, that I am a friend to liberty in the literary, as well as civil world, since tyrannical authority in either will

equally depress the writer, and enslave the subject; to *think* is the prerogative of every rational creature, and freely to declare its sentiments, its happiest privilege. This liberty indeed, you will say, is designed for the investigation of truth, so should be safely preserved from the abuses of the *freethinker* when he endeavours to pervert or corrupt this advantage, as well as from the attacks of the *bigot*, when he wants to destroy it; and, if you read this pamphlet, will think perhaps, that its ingenious author should be ranked under the first class, and that he may be suspected of some such intention, as he has advanced an opinion entirely repugnant to the profession of the Mosaic history. I should be glad then if you would carefully examine it, and tell me whether Mr. Hume has given us a true delineation {3} of human nature in its primitive state, or whether he hath not unjustly depreciated its dignity, by describing our ancient ancestors as altogether *rude*, *ignorant* and *barbarous*; for as they wore the same frame, possessed the same rational faculty, and were actuated by the same passions with myself, so I am desirous of being acquainted with their civil and religious constitution soon after they were placed upon this beautiful theatre. That affection, which you call benevolence, uninfluenced either by the interest, or connection of relations, friends, or countrymen, uninterrupted with those passions of envy or malice, which are too apt to engage themselves in a party towards our contemporaries, now glows with the purest ardor, and makes me wish to find that advantageous characters are given of the human race, even in the remotest ages of antiquity. {4}

LETTER to ACASTO.

I Sat down with a full expectation of being highly entertained with the perusal of the pamphlet which you recommended to me in your letter; for the character of its author, and the plan he proposes to pursue, gave me great hopes of finding some new light flung upon the obscure parts of antiquity: but you may judge of the satisfaction it afforded me in this respect by the following abstract.

"It appears to me (says Mr. Hume,) that if we consider the improvement of human society, from rude beginnings to a greater state of perfection, polytheism or idolatry was, and necessarily must have been the first and most ancient religion of mankind. This opinion I shall endeavour to confirm by the following arguments.

'Tis a matter of fact uncontestable, that about 1700 years ago all mankind {5} were idolaters. - Behold then the clear testimony of history. The farther we mount up into antiquity, the more we do find mankind plunged into idolatry. No marks, no symptoms of any more perfect religion. The most ancient records of human race still present us with polytheism, as the popular and established system. As far as writing or history reaches, mankind in ancient times appear universally to have been polytheists. Shall we assert, that in more ancient times, before the knowledge of letters, or the discovery of any art or science, men entertained the principles of pure theism? That is, while they were ignorant and barbarous they discovered truth: but fell into error as soon as they acquired learning and politeness. But in this assertion you not only contradict all appearance of probability, but also our present experience concerning the principles and opinions of barbarous nations. {6} The savage tribes of America, Africa, and Asia, are all idolaters."

The meaning of this argument is, that as far as history reaches, the popular religion of most countries is found to have been polytheism; and as mankind were altogether ignorant and barbarous before the knowledge of letters, or the discovery of any art or science, so unable in such a state to find out the principles of theism, therefore polytheism must have been their first and

most ancient religion.

But the incapacity of a people unacquainted with the arts and sciences, to find out the principles of theism, should be demonstrated, before this argument can have any weight or validity whatever; otherwise mankind may reasonably be supposed to have made this discovery, long before the arts and sciences were known. For the works of the creation are the certain, and have been the perpetual testimony of the existence of a God, and reason is the medium with {7} which the human creature, from the very first period of its being, hath been furnished to discover it: it always saw the sun enlivening every part of the creation, the earth bringing forth provision for its use, the seasons returning in the utmost regularity and order; it must always have observed itself to be surrounded by an innumerable species of creatures, and could not help perceiving its own inability to form or give life to the meanest insect: and from that reflection must have been immediately led to conclude, that this beauteous scene of things must certainly have been created by a being infinitely superior in wisdom and power to man. But the mind did not want the irradiation of the arts, to enable it to discover this truth; for neither the utmost perfection in architecture, sculpture, painting, or statuary, would lead it to such contemplations as these. In succeeding ages indeed, when mankind were acquainted with the sciences, they might have acquired more {8} refined proofs of a deity: as the beautiful symmetry of parts which is conspicuous in the human frame, is an infallible conviction to the anatomist of the wisdom of its author; the laws of gravity in the heavenly bodies will afford the astronomer the most august idea of that being who first put them into motion. But it will be too peremptory to affirm, that the illiterate *ancient* might not from pure intellect contemplate this scene of things, with the same rapture of admiration, with the same emotions of gratitude towards his Creator, as the cultivated *modern*. Education indeed may polish the reflections of mankind, but it cannot generate them; and you must necessarily suppose the seeds of knowledge to be planted in the peasant, before they can be expanded into the arts and sciences in the philosopher. So mankind were as able to discover the existence of a God in the remotest ages of antiquity, as at present; and consequently it neither contradicts {9} any appearance of probability to assert, that notwithstanding as far as history reaches, mankind in ancient times appear to have been polytheists; yet in more ancient times, before the knowledge of letters, or the discovery of any art or science, men entertained the principles of theism. That is, while they were ignorant of these accomplishments, they discovered truth, but were afterwards compelled to embrace idolatry, for political purposes (as it will appear in the sequel). Neither doth such an assertion contradict our experience of barbarous nations, who are not all idolaters: the natives of New England believe in a supreme power, that created all things, whom they call Kichtan,[2] and those of Canada believe in the existence of a God.[3]

The Peruvians called the first cause of all things, Pachacamac; by which word they meant the quickener of the universe; {10} or the great soul of the world. This name was so very sacred, and venerable amongst them, that they never mentioned it but upon extreme necessity; and then not without all the signs of devotion imaginable, as bowing the body and head, lifting up the eyes to heaven, and spreading out their hands.[4]

The idolatrous Indians of Asia acknowledge only one infinite God, almighty, and only wise, the creator of heaven and earth, whom they call Permessar, and represent by an oval figure, as the most perfect.[5]

The Africans of Negroland likewise worship Guihimo, i.e. the Lord of heaven.[6]

But to confirm this opinion: Mr. Hume proceeds to tell us, that

> a barbarous necessitous animal (such as man is on the very first origin of society) pressed {11} by such numerous wants and passions, has no leisure to admire the regular face of nature, or make enquiries concerning the cause of objects, to which from his infancy he has been gradually accustomed.... Imagine not that he will so much as start the question, whence the whole system, or united fabric of the universe arose.[7]

This is a notable observation indeed, and indisputably proves, that as long as man continued to be a *barbarous, necessitous animal*, he was most certainly a *barbarous*, and *necessitous animal*; but it by no means follows from thence, that he was a *polytheist*. A creature starving with hunger would be anxious only of conquering its immediate wants, and not yet curious of enquiring into the order of the universe, or what relation it might have to a superior being; and so, in such a state as this, would be of no religion whatever. Therefore {12} the society must necessarily be supposed to have been amply supplied with the conveniencies of life, and that different stations were allotted to its several members, before curiosity excited any of them, whose employments might engage them the least in their worldly affairs, to enquire from whence they sprung; and man must have been a civilized, contemplative, and reflecting creature, before he could have been a religious one; must be supposed to have argued, and reasoned upon his own nature, to have been sensible of his dependence on a superior power, before he could think of applying to that power for relief.

The question is, whether the human creature, after having exercised its intellectual faculties, and considered the different parts of nature, after having surveyed the stupendous furniture of the heavens, and admired the exquisite order and harmony of this beauteous scene, it would suppose it to be the effect of infinite {13} power, perfect wisdom, and goodness, and so be led to adore its supreme Creator; or whether, (as Mr. Hume asserts) it imagined, *each element to be subjected to its invisible power and agent; the province of each god to be separated from that of another; and that its first ideas of religion arose from the incessant hopes and fears which actuate the human mind; so invoked Juno at marriages, Lucina at births*.

In short, the question is, whether the primary religion of a rational creature, was the offspring of its reason or the monster of its fears. This latter opinion Mr. Hume has borrowed from the poet's observation, that *primus in orbe deos fecit timor*:[8] an assertion which deserves rather to be ridiculed, than to be seriously confuted.

To proceed. The author observes,

> it must necessarily be allowed, that, in order to carry men's attention beyond the visible course of things, or {14} lead them into any inference concerning invisible, intelligent power, they must be actuated by some passion, which prompts their thought, and reflection, some motive which urges their first enquiry. But what passion shall we have recourse to, for explaining an effect of such mighty consequence? not speculative curiosity, or the pure love of truth. That motive is too refined for such gross apprehensions, and would lead them into enquiries concerning the frame of nature, a subject too large, and comprehensive for their narrow capacities. No passions therefore can be supposed to work upon such barbarians, but the ordinary affairs of human life: the anxious concern for happiness, the thirst of revenge, the appetite for food, and other necessaries.

Such is Mr. Hume's opinion of our ancient ancestors.

He thinks, that they were senseless of every emotion, but *fear, revenge*, {15} and *hunger*; qualities

indeed more justly applicable to the beasts of the forest, than to rational creatures. But it may be asked; why was *Speculative curiosity, or the pure love of truth, too refined for their apprehensions?* Doth he imagine that nature did not bestow her talents in so liberal a manner amongst her ancient sons, as amongst us? Doth he suppose that no inquisitive genius, no philosophic mind ever prevailed amongst them, but that reason and reflection are only of modern growth? Why might not a *Bacon, Locke*, or *Newton*, have existed in the remotest ages, since human nature hath always been the same from its first creation? Perhaps as the poet observes,[9]

Before great Agamemnon reign'd
Reign'd kings as great as he, and brave, {16}
Whose huge ambition's now contain'd
In the small compass of a grave,
In endless night they sleep unwept, unknown
No *bard* had they to make all time their own.

But withall, we may demand what right he has to give them the appellation of *ignorant barbarians*, of having *gross apprehensions, narrow capacities?* For a deficiency of records must always deprive an impartial enquirer of that full conviction, by which alone he can be authorized to pronounce with any decision upon the state and condition of the ancient world. The very invention of letters did not precede the christian aera perhaps above 2000 years, being found out by Thoth in the reign of Tham,[10] and the Greeks {17} wrote nothing in prose before the conquest of Asia by Cyrus the Persian;[11] and consequently as mankind existed many ages before the use of letters, they had no means whatever (if we except hieroglyphicks, which were not to be depended upon, as being capable of various interpretations) of conveying any account of their lives to posterity; so one generation passed away and was but feintly remembered, or entirely forgotten by its succeeding one, and some edifice or column perhaps was the only evidence that mankind then had of the very existence of their ancestors. If a few centuries would thus obliterate the memory of people, and nations, before the use of letters, must not we call it presumption in this author, thus dogmatically to declare that they were altogether *rude*, *ignorant*, and *barbarous* in their manners, and that idolatry was their first religion? {18}

So whether theism or polytheism was the primary religion of mankind, can be determined upon no other authority, than revelation; and it *that* is excluded by this author, then the solution of this question can be only founded on conjecture, and that side of it which is supported by the greatest degree of probability have a right to our assent.

Upon this principle alone must we argue, and let us consider the state of mankind in the remotest ages, upon the testimony of the most ancient monuments, and records, and endeavour from thence to form a reasonable idea of their manners and religion.

The pyramids of Egypt were built before the use of letters,[12] and have still {19} survived the storms, and mouldering hand of time, to convince us, that its builders compounded the mechanical powers in a manner unknown to us at present;[13] and their situation likewise proves that they were acquainted with astronomy.[14] Architecture,[15] sculpture,[16] ship building,[17] and embroidery[18] were brought to great perfection in Homer's time. Xenophon speaks of great masters in statuary, and painting:[19] and we find in Plutarch, a remarkable proof of the excellent administration of justice amongst the ancient Egyptians.[20] If we consider withal the descriptions {20} which authors have given us of the magnificent cities of Thebes,[21] Babylon,[22] and Memphis;[23] of the temple of Diana at Ephesus,[24] of the amazing works of the labyrinth,[25] of

the lake Moeris,[26] or of the famous statue of Memnon;[27] can we help being astonished at the progress which the ancients had made in the mechanical arts? Is it then reasonable to suppose, with Mr. Hume, that these people were *rude* and *ignorant*, and *that speculative curiosity was too refined for their gross apprehensions*? Is it to be imagined that these ancient philosophers, artists, and law-givers, were not curious to enquire {21} from whence they sprung, and what being it is who endued them with that excellent faculty, by which they were enabled to measure times, to calculate the motions of the heavenly bodies, to plan the city and the pyramid; that faculty which taught them how to animate the block into a statue, and to enliven the canvass to a picture? Can we believe that these ingenious people, who by the greatest strength of mind had invented that amazing art of letters, and the noble science of mathematicks, who had improved their understanding to such a degree of excellence in every respect, were either unable to discover the existence of a God, by the plain evidence of his works, or could refrain from enquiring what power it was, which constituted such beautiful order through the whole creation? Or shall we think with Mr. Hume, that they looked upon this scene of things with the same indifference and stupidity, as the irrational brute? No! we cannot, {22} after such indisputable evidence of the ingenuity and wisdom of the remotest ages, believe otherwise, than that they discovered and adored the divine being; for these testimonies are matters of fact, which no prejudice can elude, and as indisputably demonstrate the ability of man, as the works of the creation demonstrate the power and wisdom of God. Permit me then to indulge myself in a conjecture, that my ancient ancestors often turned their eyes to the blue vault of heaven, and chanted to their Creator like Adam in his morning orison, (for they undoubtedly observed, reflected, and admired.)

> **These are thy glorious works, parent of good,**
> **Almighty, thine this universal frame,**
> **Thus wondrous fair; thyself how wondrous then!**
> **Unspeakable, who sit'st above the heavens {23}**
> **To us invisible, or dimly seen**
> **In these thy lowest works; yet these declare**
> **Thy goodness beyond thought, and pow'r divine.[28]**

We have likewise great reason to believe that theism was the primary religion of mankind, as the sensible part of them in all ages were of this opinion.

Orpheus,[29] Homer,[30] Thales,[31] Pythagoras,[32] Anaxagoras,[33] Socrates,[34] Plato,[35] and {23} Aristotle[36] believed in the existence of a divine being. The Thebans believed in a self-existent and immortal being, whom they called Kneph,[37] and all the Egyptians in general esteemed God to be the cause of every creature that was generated, and of all the powers in nature, that he is superior to every thing, and that he is an immaterial, immortal, self-existent being, who governs and sustains every part {25} of the creation.[38] The Ethiopians,[39] the Persians,[40] and Chinese,[41] professed the same belief. Cicero observes, that there is no nation so savage and barbarous, which doth not believe in the being of a God, tho' it may be ignorant of the manner of his existence.[42] Dr. Warburton likewise says,

> **It is not only possible that the worship of the first cause of all things was prior to any idol worship, but in the highest degree probable; idol worship {26} having none of the appearances of an original custom, and all the circumstances attending a depraved and corrupted institution.[43]**

If we then impartially consider the evidence of probability on either side of this question, we shall

certainly be induced to believe that theism was the primary religion of mankind. Nay, if these testimonies which have been produced in favour of this opinion be excluded, let me even then ask you, Acasto, whether it is not more consistent with reason, to suppose that the wise, ingenious, thinking creature which we call man, whom the supreme being hath so eminently distinguished from the rest of the animal creation, by reason and reflection,[44] believed and adored his Creator, in the remotest ages of antiquity, than (according to Mr. {27} Hume's plan) that he worshipped the ridiculous objects of idolatry? So I shall conclude this epistle with the words of Sir Isaac Newton;

> The believing that the world was framed by one supreme God, and is governed by him, and the loving and worshipping him, and honouring our parents, and loving our neighbours as ourselves, and being merciful even to brute beasts, is the oldest of all religions.[45]

THEOPHILUS.

"The Insufficiency of Mr. Hume's Objection to the Credibility of Miracles"

Discourses on Various Subjects

William Samuel Powell

1776

Editor's note: William Samuel Powell (1717-1775) held several posts as a divinity school lecturer and clergyman. The *Discourses* (1776), published after his death, are a collection of 17 sermons, three charges, and a biographical sketch by the editor. The *London Review* opens its review of the *Discourses* with the following:

> **The orthodox author of these Discourses made himself long since many enemies, among the party of the petitioners against subscriptions, by the sermon he preached, about twenty years ago, before the University of Cambridge, and published soon after under the title of 'A Defence of the Subscriptions required in the Church of England.' This Sermon decried by some as much as it was commended by others, is here printed.... The subject of most of the sermons is the evidence of different kinds in favour of Christianity. (1776, Vol. 4, pp. 297-298).**

The *Critical Review* comments that "Some of the discourses contained in this volume were preached before the university; and others in the college-chapel; and were chiefly intended for younger students in divinity.... These sermons and charges bear the marks of an agreeable writer, rather than a profound enquirer, or a solid reasoner" (1776, Vol. 42, pp. 131-136). The *Discourses* are also reviewed in the *Monthly Review* (1776, Vol. 55, 173-176), although more neutrally. The essay on Hume, Discourse six, defends the New Testament resurrection account against Hume's criticism of miracle testimonies. Powell concludes that the weight of evidence favors the resurrection, as opposed to fraud or deception. The *Discourses* were printed a second time in 1794. The following is taken from the 1776 edition.

DISCOURSES ON VARIOUS SUBJECTS
London: L. Davis, 1776

{88}

DISCOURSE 6
THE INSUFFICIENCY OF MR. HUME'S OBJECTION TO THE CREDIBILITY OF MIRACLES

Acts xvii.32

And when they heard of the Resurrection of the Dead, some mocked; and others said, We will hear thee again of this matter.

ST. Paul, in his discourse to the Athenians, on that fundamental doctrine of Christianity, the Resurrection to a final judgement, appeals to the testimony of a fact, and alledges our Saviour's return from the grave, as giving assurance to all mankind {89} of their own future existence. His philosophical hearers, we are told, were partly Epicureans and partly Stoics; and the reception they gave to his instructions was agreeable to the prejudices which each sect had imbibed: the disciples of the garden, as is probable, being those, whose physical tenets disposed them to ridicule the very thought of a Resurrection; and the students of the porch, those less insolent hearers, who, being unable to resist the force of his reasoning, and unwilling to submit to it, desired a farther account of so extraordinary an opinion. The apostle however, as it seems from the following part of the history, did not gratify them: but left the Greeks to sooth their learned vanity, by casting the imputation of foolishness on doctrines they could so little relish or comprehend. And yet neither they who doubted, not they who mocked, were, by the principles of their schools, so far from the kingdom of God, as some among the infidel philosophers of modern times. The Epicureans admitted as true the relations of some miraculous event; but endeavoured to shew, that they were not contrary {90} to nature. The Stoics believed the reality of events, which they confessed to be supernatural, and considered as the interpositions of Providence for the good of mankind. Here then the field of conviction was wide and open; and among the others it was not absolutely precluded. But how shall the advocate of Christianity address himself to, or reason with, those subtle disputants, who refuse to assent to facts the most strongly attested, if they are not such as experience warrants; who would teach us to reduce all human testimony to the precarious standard of our particular knowledge and observation? Vain is every inquiry into the abilities, the dispositions, the motives the number, of the witnesses, by whom the miracles of Christ have been transmitted to us; if the very nature of the facts renders them incapable of proof. And, though each of these particulars should appear to be such, as might satisfy the most scrupulous examiner: it would be unfair not to attend to an argument; which, if it be conclusive, destroys the efficacy of them all. Truth can never want, and should always disdain to accept, {91} such suspicious favours. The objection therefore shall be fully stated, and fairly considered.

"It is evident, says this objector, that the credibility of a fact depends not entirely on the number, the qualifications, and dispositions, of those who relate it: since, where these are all equally

unexceptionable, the degree of credibility is allowed to be very different. Let a man of common understanding relate for us an usual event; for which he alledges the clear and undisturbed evidence of his senses: if we know of no purposes he has to serve, no passions to indulge, by leading us into error; and if we have no reason to suspect the truth of his relation from opposite testimony; we readily yield him our assent. Yet change but the fact, which is familiar to our apprehensions, into one of the marvellous kind, and a number of such witnesses would find it difficult to convince us. Nay, a degree of external evidence, which in common cases would be admitted without a doubt, by increasing the repugnancy of the thing related to our observations and opinions, may not only lose all {92} its probability, but we may even have full conviction that it is false; conviction founded upon those very principles which induce us to assent to human testimony. The experience we have, that men do not generally deceive us in their narratives, is the foundation of the credit we give them. The experience we have of the constant uniform course of nature produces an expectation of the same regularity in the parts untried. The assent is determined in the two cases by the same principles: and when they draw it on opposite sides, the superior force must prevail. But the experience of nature being continual and unvaried, whilst that of the veracity of human testimony is weakened by many exceptions of fraud or mistake, the latter can never overcome the former; and therefore no attestation of witnesses, however able and honest they may appear, can convince a just reasoner of a miraculous event."

Every part of this objection abounds with ambiguity and fallacy. When experience is made the sole criterion of truth, must we understand by it our own experience, or that of others? If *our own*, at what period of {93} our lives? Must he who has lived twenty years without seeing an eclipse of the sun, or a comet, reject the accounts of them as fabulous? or he who has not dwelt near Vesuvius, believe nothing of its fiery eruptions? There are many real facts, so opposite to the experience of those to whom they may be related, that, if they govern their assent by that experience, they will certainly look upon them as false. Some of these events are regularly repeated: whilst others are more irregular and unconnected; in judging of which from the principles of analogy, the most comprehensive knowledge of nature would be deceived. For though we are continually enlarging our experience, and correcting the judgements formed by it; yet it is still confined to few objects, and open to many uncertainties and errors. We frequently give credit to the relations of others though they correspond not with it and our after-experience convinces us that the credit was just. -- Or is it the experience of *others* which must fix our opinions. This can only be known to us by testimony; and it must overthrow itself, {94} if it destroys the force of that testimony, on which alone it rests. If we search into the origin of our knowledge of facts, that portion of it which is acquired by our own powers will be found small in comparison of that which is derived from testimony. And to refute our assent to well-attested facts, because we believe other facts, not better attested, is plainly unreasonable. We must therefore weigh the evidence, and not reject, without examination, all such narratives, as contain matters uncommon, or even before unheard-of.

Again, it is difficult to conceive in what sense miracles are said to be *repugnant to experience*. Several relations of the same fact may be inconsistent; but unconnected facts, how different soever, are not repugnant to each other. You have never known a dead man restored to life. Yet the witnesses of such an event cannot be refuted by your ignorance. {95}

But nature we are told, is uniform and unvaried in her operations. This either presumes the very point in question, or touches not those events which are supposed to be out of the course of nature. And the conclusion established upon it, that, from our observations of this regularity, we may convict of falsehood all accounts that do not coincide with it, is wholly without foundation. -- But

let us examine it a little more particularly. The probability of facts, derived from experience, admits all the degrees and changes that are conceivable. An event, once observed, leaves an expectation in the mind, that it may happen again. The repetition of the same event raises that expectation continually, till it mounts to a probability, or even moral certainty. But every change of circumstances, even distance alone, whether of place or time, weakens the force of analogy; and our short and scanty experience produces, after such removals, a proportionably lower assurance of the regularity of events. That the motion of the heavenly bodies will be the same tomorrow as to-day, may be considered as {96} almost certain. That it will continue the same a hundred years, is probable. But whether it will meet with no interruption in a thousand or ten thousand ages, appears doubtful. -- When we turn our view backward, the distant prospect, if not enlightened by history, is equally obscure. No miracles for the confirmation of our religion have been performed in the present age. This creates a presumption, we may allow, against any pretences to them in the age before us, when the condition of religion was nearly the same. But, if we carry back our inquiry to remote times, and to the original propagation of Christianity, this presumption, weak at first, and drawn from a short experience, loses its gold at every step, till it leaves the mind in perfect freedom. Vainly do men presume, from a few detached and cursory observations, to comprehend the whole scheme of Providence, and to decide arrogantly what is, and what is not, consistent with it.

But, should we admit the principle, on which this objection is founded, that the laws of the universe are constant {97} and unchangeable, it would not justify us in rejecting the evidence of miracles. For may not miracles, though deviations from the general rules established here, be parts of a higher and more general course of nature? May it not be agreeable to the established laws of a moral government, that God, for the instruction of his creatures, should suffer some of the laws of the natural world to be suspended? To enable us to judge whether this be according to the order of the universe, we ought to see and examine many like cases. But where shall they be found? We know of no revelations, which God has made of himself to mankind, but those recorded in the Old or New Testament. Now these are all established on similar proofs. They stand united in themselves, separated from all other events. If you would search for circumstances of resemblance, you must pass to some other planet, and view other systems of rational beings.[2] The experience of what has happened on this our earth, will afford no ground for a comparison: and yet, without many such comparisons, it is impossible to determine, that {98} those changes, in the particular laws of the visible world, are contrary to the rules of God's universal government.

Here then we might rest the Christian cause; content with having proved that the miracles, by which it is supported, and for which there are such abundant testimonies, are not in their nature incredible. But perhaps a thinking man may go a little farther, and demonstrate (what must not only remove all these objections from analogy, but set them on the side of religion) that *one* miracle, at least, has been wrought. For was not the creation of mankind a miracle? Certainly it was, in the strictest and most proper signification of the word; if the human race be not as old as the material world. But, if man and all the laws of nature had their birth together, then the late origin of these laws must greatly lessen any prejudice against their interruption.

But whilst we disallow the judgements formed from experience concerning facts unknown, do we not weaken the principal evidence on which our religion is established? Is it not experience alone, which gives {99} strength to testimony? Do we not admit or reject the witness of any fact, as we have found that other men in like circumstances have rarely or usually deceived us? Experience is, without question, the general foundation of credit. But the force of *united* testimonies depends not

wholly upon it. When the expectation arising from a single witness is known, the degree of assurance produced by a number is subject to a precise calculation, though the number be greater than we have ever heard attest the same fact. Thus, if the relation be of such a nature, and the single witness of such a character, that the mind is exactly balanced, and remains in perfect doubt; then may it be strictly demonstrated, upon the clearest mathematical principles, that, if ten such witnesses agree in their report, the probability of its truth exceeds more than a thousand times, and if twenty agree, more than a million of times, the probability of its falsehood. But, should we endeavour to collect the sum of all the probabilities for the truth of Christianity, we should soon be stopt by the immensity of the numbers; and {100} should find the difficulty like that of answering the old inquiries, by how many accidental casts of the twenty-four letters the Iliad might be formed, or in what time the fortuitous jumble of atoms would produce an animal. And, as the impossibility of resolving these questions affords the strongest proof of design and wisdom in the creation; so the difficulty in the other may help us to conceive that mass of evidence, by which the Christian religion is confirmed.

But, without this nice inquiry, even upon the principles of our adversaries, our faith must remain secure. For, unless it can be shewn, that some set of men, equal in number to the witnesses of the resurrection, and possessed of equal opportunities of knowing the truth, have yet been deceived in plain facts, about which it was so much their interest not to be deceived; or have concerted a fraud, from which they had so little to hope, and so much to apprehend: unless one of these suppositions can be proved, (and both of them the advocates of Christianity have often confuted) we may fairly conclude, that there is incomparably better evidence {101} for the resurrection of Christ from external testimony, than against it from its unlikeness to other events. For, the degree of external evidence, by which it is confirmed, has never misled mankind; but the principle of unlikeness does often, and must necessarily, deceive them. The legitimate use of this principle is to form a judgement, not of events unlike, but of events like, to our experience; not to decide, that the former never happened, but to ground an expectation, that the latter may happen hereafter. And this use was made of it by the apostle, when he argues, that Jesus, by rising from the dead, became an unquestionable witness of a general resurrection.

Remarks on Mr. Hume's Dialogues concerning Natural Religion

Thomas Hayter

1780

Editor's Note: Published in 1780, Thomas Hayter's *Remarks* is the first sustained discussion to appear of Hume's *Dialogues*. Hayter's comments are confined to the discussion of the problem of evil in parts 10-12 of the *Dialogues*. The complete review in the *Monthly Review* is as follows:

> **These remarks are such as must naturally and obviously occur to those readers who are conversant with moral and theological subjects, and acquainted with Mr. Hume's writings. They chiefly relate to the moral attributes of the Deity, and the influence of religious principles upon human conduct. The Author writes in a lively and animated manner; and his style, after a little more practice and attention to the rules of composition, will, we doubt not, become more chaste, correct, and uniformly elegant. (1781, Vol. 64, p. 159).**

The *Critical Review* concludes its brief review noting that Hayter uses an *argumentum ad hominem* "which the advocates of Mr. Hume cannot possibly evade" (1780, Vol. 49, pp. 315-316). The *London Review* notes that Hayter counters Hume's objections to the moral attributes of the deity "with considerable success." They continue, though, listing Hayter's stylistic errors, although one error is corrected in Hayter's errata (1780, Vol. 11, p. 282-283).

REMARKS
ON
MR. HUME'S DIALOGUES,
CONCERNING
NATURAL RELIGION.

By, T.[homas] HAYTER, A.M.
FELLOW OF KING'S COLLEGE, CAMBRIDGE;
AND ONE OF THE PREACHERS AT HIS MAJESTY'S
CHAPEL IN WHITEHALL.

CAMBRIDGE,
Printed by J. ARCHDEACON, Printer to the UNIVERSITY;
For T. CADEL, in the Strand, London.
M.DCC.LXXX.

REMARKS ON MR. HUME'S DIALOGUES.

{1}

REMARKS ON MR. HUME'S DIALOGUES

MR. HUME, in the introduction to his Dialogues (p. 10.) exhibits the following sketch of the personages between whom the Dialogues are supposed to be maintained. "The remarkable {2} contrast in their characters still farther raised your expectation; which you opposed the accurate philosophical turn of CLEANTHES to the careless scepticism of PHILO, or compared either of their dispositions with the rigid inflexible orthodoxy of DEMEA." From this representation one might at first be led to look for Mr. HUME himself under the mask of CLEANTHES, and to expect from the mouth of CLEANTHES the celebrated Metaphysician's own sentiments. Let us consider however that Mr. HUME, after the great nominal superiority attributed to CLEANTHES, could not possibly, without appearance of vanity, have appointed CLEANTHES his representative. The fact indeed indisputably is, that PHILO, not CLEANTHES, personates Mr. HUME. CLEANTHES assumes times (p. 242 and 244) the tone of DEMEA: while PHILO possesses in general the sole exclusive priviledge {3} of retailing the purport of Mr. HUME'S former Philosophical productions. -- Every remarkable trait and feature of those productions may be traced in the parts of the Dialogue assigned to PHILO.

{4, 5}

PART I.

THE first part of Mr. HUME'S Dialogues is employed in proposing and canvassing different systems of cosmogony -- The system of CLEANTHES deducing (p. 47) the universe from an intelligent cause (after being confronted by various intermediate theorys) is allowed (at p. 196) to prevail over its rivals, and to convert their advocate, PHILO -- Neither the system of CLEANTHES, in its original state, nor any of its rivals are proposed {6} as the objects of the present disquisition. The sole aim of these remarks is to contravert PHILO'S own additions to the system of CLEANTHES, viz. PHILO'S

disavowal of God's moral attributes, and his proscription of popular religion. PHILO'S objection to the existence of benevolence in the divine nature is grounded principally on the circumstance of human misery. Of this melancholy object he[2] exhibits (from p. 173 to p. 192.) a most uncomfortable, forlorn, and, I trust, overcharged description -- Some of the darkest shades in the frightful picture are borrowed {7} from the Pencils of writers in general, particularly of Poets. Their testimony PHILO appeals to (p. 173 and 174) as decisive, "The Poets (p. 173.) who speak from sentiment, without a system, and whose testimony has therefore more authority, abound in images of this nature." Again, (p. 174.) "Look round the library of CLEANTHES. I shall venture to affirm that, except authors of particular sciences such as chemistry and botany, who have no occasion to treat human life, there is scarce one of those innumerable writers, from whom the sense of human misery has not in some passage or other, extorted a complaint and confession of it." Let us here, by PHILO'S leave, recall to recollection an old remark "Omnes ingeniosos esse melancholicos." Suppose now any individual of the pensive tribe to labour under a real misfortune or under the spleen, and to have, at that critical {8} moment, a pen in his hand: He instantly, in all human probability upon the slightest provocation in his subject, gives a dash at the condition of mortal affairs: vents his particular emotions in general terms: expands a partial posture of private concerns into an universal representation: and etches a copy of human life from the present complexion of his own situation -- With respect to Poets, we need not conceive them in any actual distress in order to justify a suspicion of some misrepresentation in the affair of human calamity. What pathetic incident ever passed through the hands of a genuine bard without receiving many touches of amplification? And is the interesting argument of mortal misery likely to be dismissed naked, and unadorned, totally destitute of its poetical finishing? Without calling in the supposition of absolute fiction, how greatly does the warm animated language alone of {9} poetry vary the aspect, without altering the circumstances, of a fact; and magnify, without seeming to depart from truth? In what doth oratory consists? not professedly, nor yet visibly in falsification. Yet, hear the same identical narrative at one time form an eloquent, at another time from a plain man; you will perceive the one to have heated, you know not why, your passions and imagination, while the other best satisfies your judgment. In a word, the testimony of authors, especially of "the inspired train", as PHILO calls the poets, does not seem worthy of the great stress laid upon it by PHILO.

RENOUNCING then the illusions of fancy, let us listen to PHILO'S own representation of the horrid scene. "You ascribe (p. 186) CLEANTHES, (and, I believe, justly) a purpose and intention to nature. But what, I beseech you, {10} is the object of that curious artifice and machinery, which she has displayed in all animals? the preservation alone of individuals and propagation of the species. It seems enough for her purpose, if such a rank be barely upheld in the universe, without any care or concern for the happiness of the members that compose it. No resource for this purpose: no machinery in order merely to give pleasure or ease: no fund of pure joy and contentment: no indulgence, without some want or necessity accompanying it. At least the phenomena of this nature are overbalance by opposite phenomena of still greater importance. Our sense of music harmony and indeed beauty of all kinds gives satisfaction, without being absolutely necessary to the preservation and propagation of the species. But what racking pains, on the other hand, arise from gouts, gravels, {11} megrims, tooth-achs, rheumatisms; where the injury to the animal-machinery is either small or incurable? Mirth, laughter, play, frolic seem gratuitous satisfactions, which have no farther tendency: Spleen, melancholy, discontent, superstition are pains of the same nature". Again, (at p. 191) "You must at the same time allow, that if pain be less frequent (which is extremely doubtful) than pleasure, it is infinitely more violent and durable. One hour of it is often

able to out-weigh a day, a week, a month of our common insipid enjoyments; And how many days, weeks, and months are passed by many in the most acute torments? Pleasure scarcely in one instance is ever able to reach ecstasy and rapture: And in no one instance can it continue for any time at its highest pitch and altitude, The spirits evaporate; the nerves relax; the fabric is disordered; {12} and the enjoyment quickly degenerates into fatigue and uneasiness; But pain, often, good God, how often! rises to torture and agony; and the longer it continues, it becomes still more genuine agony and torture. Patience is exhausted; courage languishes; melancholy seizes us; and nothing terminates our misery but the removal of its cause, or another event, which is the sole cure of all evil, but which, from our natural folly, we regard with still greater horror and consternation". It positively asserts, at setting out "that the sole object (pray mark the expression "sole") of nature's curious machinery is the preservation of individuals and the propagation of the species". At the distance of a few sentences, however, the tale enumerates several sources of delight "not absolutely necessary to the preservation and propagation of the species". Is this {13} reasoning, PHILO, or prating? would not a single instance (you recite several) of "gratuitous satisfaction" completely exclude the supposition of a total insensibility and unfeelingness, if we may so speak, in the determinations of nature? She does not, you say, grant as much as I could reasonable with -- But, if she had been perfectly and entirely inattentive to your accommodation, would She have granted any thing at all? "The phenomena of her graciousness, you reply, are overbalanced by opposite phenomena of still greater importance". How does this subterfuge demonstrate your first doctrine of a total uniform obduracy? If nature had been so unequivocally void of goodness as you pretend, She would have exposed you to the evils you describe without any, the slightest mixture of alleviation: she would never have imparted any solace, that could possibly have been dispensed with: and {14} you would have drunk from her cup nothing but dregs. You must surely retract your first accusation.

DISLODGED form this post you next retreat to the position, that evil does, upon the whole, predominate in the canvass of nature: the picture is cast in shades. Before we adopt your representation, let us survey the facts on which it is grounded. Your own catalogue of evils is nearly equal in point of number, with your list of blessings. Thus far your argument looks almost equally both ways: it will quickly, I hope, set its face against you. If, for instance, your evils, though rather more numerous than your blessings, be found to center in a comparatively small number of individuals, while your blessings are pretty generally diffused through the human race, there will evidently result, in regard to the whole creation, a far greater measure {15} of happiness, than of misery. This conclusion cannot be denied, if the two first branches of the sentence are established. To establish them is my task -- In regard to the first branch, namely, the comparatively narrow operation of PHILO'S evils; are most of those evils, let us ask, any thing else than various species of ill health? And is health or sickness, let us next ask, the most usual visitant to the sons of men? A great proportion of mankind in every civilized country live in a state of idleness: if a great part of the remainder was sick, how could the business of the world go on? Let every one, in a word, form his own experience strike an estimate of the actual balance between sickness and health, and then answer my question. PHILO has, it must be confessed, two evils, discontent and superstition, not strictly reducible to the head of sickness. Are not both these evils, however, of a {16} very precarious, fluctuating nature? Chearful company, a fine day, the slightest amusement, the most trivial employment suspend, sometimes cure, their influence. May they not therefore fairly be considered as a sort of neutral powers; hanging at equal distances between the attractions of pleasure and pain, and not decisively gravitating towards either? PHILO'S evils, upon the whole,

appear evidently to have a much more contracted range in human life than PHILO was willing to ascribe to them -- Let us next see, if PHILO'S blessing (which is the second branch of the sentence I am to demonstrate) do not move in a pretty large circle? Is any man so unfortunate, as not frequently to have tasted some of these blessings? Is any man so forlorn, as to despair of all future access to the rich feast? -- The reader does, I flatter myself, by this time think me entitled to the conclusion, which I drew from {17} the two branches of my sentence now discussed, viz. That good, not evil, is the leading feature in the state of mortal affairs.

BUT though PHILO should allow pleasure to have the ascendancy, in point of frequency, over pain; PHILO still laments (p. 191 and 192) that the former sensation is inferior to the latter both in duration and degree. "Pleasure, he cryes, scarcely in any instance is ever able to reach ecstasy and rapture". What a complaint from a Philosopher! who tells us (at p. 259) of these very dialogues "That there is no state of mind so happy as the calm and equable." Without however pressing the Philosopher either with his character or declarations, let us look abroad into the world, and see whether the wand of "ecstasy and rapture" be very generally and seriously deplored. That part of mankind, {18} which is engaged in constant employment, and which possesses at the same time either a competence or at worst a bare sufficiency of necessarys, comprehends probably near two thirds, at all events half of the human race. Now amongst this very large body it is much to be doubted if the scarcity of "ecstasy and rapture" has, ever since the creation, been the transient occasion of a single sigh. These contented mortals dream not of raptures, bu enjoy satisfaction: they have not the word ecstasy in their mouths, but solid tranquility in their hearts: they wish not to be angels, and are happy men: they have not yet schooled themselves into discontent: nor learnt the sublime science of becoming metaphysically miserable -- PHILO'S estimate of pain now claims our attention. "Pain, often, good God, how often! rises to torture and agony". That pain is sometimes excessive, it is more {19} our business to lament, than to deny. Let us remark however, foe the consolation of mankind, that this melancholy grievance appears often of greater magnitude and in far larger dimensions to the spectator, than to the sufferer. Persons, condemned by sickness to lasting confinement and quick returns of pain, wear, not uncommonly very strong marks of serenity and acquiescence. The goodness of God's providence infuses, no doubt, some drops of comfort into the bitter draught of agony, to attemper its malignity and restrain its excessive operation. -- At the worst, an event, not far distant from any of us, is, according even to PHILO'S account (p. 192), "A cure of all evil." PHILO indeed adds, "But which, from our natural folly, we regard with horror and consternation." But pray, if death be really a cure of all evil, are we not, when it comes, cured by it, whether {20} we wished to be so, or not? does death, when it actually takes place, loses its efficacy, as a remedy, through our previous misconceptions of its nature? -- Let us here remark, that when men of sense shudder at death, their emotion, it is to be feared, arises more from depravity, than folly. The profligate and irreligious may naturally recoil from the approach of that futurity whose reality they have questioned; and may justly dread the frowns of that being whose authority they have defied. But thousands of virtuous men in all ages have received, and will doubtless, to the end of time continue to receive the final summons of their Creator with calm undisturbed composure.

PHILO from (p. 199 to p. 102) repeatedly echoes to us, that the whole sublunary scene (human life of course included) wears no stamp or signature {21} of a benevolent author. This idea (at p. 201) sprouts up into the following allusion. "Did I show you a house or palace, where there was not one apartment convenient or agreeable; where the windows, doors, fires, passages, stairs and the whole oeconomy of the building were the source of noise, confusion, fatigue, darkness and the extremes of

heat and cold, you would certainly blame the contrivance without any farther examination." Instead of examining his imaginary building, let us ask PHILO a simple question, namely, whether he has already entirely forgot "the sense of music harmony and beauty?" of p. 187. "The mirth, laughter, play, frolic" of p. 188? Has, in a word, the whole fair train of "gratuitous satisfactions," enumerated by himself, totally escaped from his recollection? If a single trace of them had survived in his memory, he would surely not have {22} represented his miserable allegorical lodging so shockingly ill-furnished, so completely deficient in every, the smallest, article of accommodation.

FROM p. 205 to p. 217 PHILO employs himself in displaying four circumstances on which, to use his own words p. 203, "All or the greatest part of the ills that molest sensible creatures depend" and by the removal of which the creation would, in his conception (p. 217.) be prodigiously improved. -- Notwithstanding however PHILO'S present apparent acquiescence in his new mundane arrangements, we find him, no farther off than p. 218, staggering into the following reflexion, "Shall we say that these circumstances are not necessary, and that they might easily have been altered in the contrivance of the universe? This decision seems too presumptuous for creatures so blind {23} and ignorant." What a pity, PHILO, is it, that this very natural obvious sentiment did not occur to you, a few pages back, at your first entrance into the intricacys of cosmogonic criticism! How endless is it to object to what we do not understand! How idle is the proposal of altering what we do not know if we can improve! To erect card-constructed houses indeed with the infant, to weave straw-crowns with the maniac seem far more rational employments of time and intellect than for blind mortals to revise creation, and ignorant theorists to new-model the universe.

DESCENDING then from these illusive, air-built speculations, let us hasten to the final result of all the foregoing theories, namely, to PHILO'S representation, inferred from the said theories, of the divine attributes.{24}

PHILO'S first position on this head (p. 221.) runs thus, "There may four hypotheses be framed concerning the first causes of the universe: that they are endowed with perfect goodness: that they have perfect malice: that they are opposite and have both goodness and malice: that they have neither goodness nor malice: mixt phenomena can never prove the two former principles: and the uniformity and steadiness of general laws seems to oppose the third; the fourth therefore, seems by far the most probable." In opposition however to the fourth supposal, let it be asked, whether one single solitary instance (PHILO has recounted several) of "gratuitous satisfaction," would not forbid us to consider the Deity as absolutely regardless of our welfare? Let it next be remarked, that to those, who adopt my estimate of human happiness and misery, the belief of God's benevolence {25} acquires instant confirmation, and stands erected upon a fair ample, immoveable foundation.

PHILO'S next feature in the divine nature is thus sketched (p. 222.) "What I have said concerning natural evil will apply to moral, with little or no variation; we have no more reason to infer, that the rectitude of the supreme being resembles human rectitude than that his benevolence resembles the human." In subversion of this doctrine I will beg leave to cite a passage from "Mr. HUME'S 11th essay on the practical consequences of natural religion," where EPICURUS, in a speech ascribed to him (p. 217.) thus expresses himself, "I acknowledge that in the present order of things virtue is attended with much more peace of ind than vice, and meets with more favourable reception in the world. I am sensible, that according to the past experience {26} of mankind, friendship is the chief joy of human life, moderation the only source of tranquility and happiness. I never balance between the virtuous and vicious course of life; but am sensible, that to a well

disposed mind every advantage is on the side of the former." The supreme being then, has (by the confession of a person not to be suspected of bigotry) interwoven in the very frame and constitution of things, a testimony to the superiority of virtue above vice: in other words, the Almighty hath provided, that the presence due to the former quality beyond the latter, should be suggested to us, at every step of our existence, by the striking evidence of familiar facts. With this glaring document of the deity's love for moral uprightness in us, let us couple PHILO'S assertion, (p. 236.) that the nature of the supreme being does, in point of intelligence, "bear a considerable resemblance to ours." And {27} will this nature, in the direction of its intelligence, totally renounce the rules recommended by itself for the government of our analogous intelligence? shall the declared lover of righteousness not do right? shall the determined patron of justice be himself unjust?

{28, 29}

PART II.

PHILO opens his charge (p. 243.) against religion with the following invective. "How happens it then, if vulgar superstition[3] be so salutary to {30} society, that all history abounds so much with accounts of its pernicious consequences on public affairs? factions, civil wars, persecutions, subversions of government, oppression, slavery; these are the dismal consequences which always attend its prevalency over the minds of men. If the religious spirit be ever mentioned in any historical narration, we are sure to meet afterwards with a detail of the miseries which attend it." We shall be extremely mistaken, if we consider all the mischiefs {31} in which the word religion has been held out, or in which religionists had concern, as the genuine fruit of mere religious influence. The name of religion has often hung upon the tongue, where no particle of her holy energy reached the heart. PHILO himself will inform us (p. 244) that "religion is (only) a cover to faction and ambition," which are the real prompters of those turbulent scenes where religion alone appears upon the stage. Now ambition and faction are durable permanent principles; and, if religion had never existed, would undoubtedly, on some pretence or other, have found vent. Passions, in a word, that use religion simply as a veil, will, though striped [sic] of the veil, present an undaunted front: though detected, they will not be dismayed. Ambition and faction are no bigots. Divested of their religious disguise, they instantly assume some other; immediately {32} new-dress their indefatigable characters, nor remain a single moment absent from the stage. They substitute perhaps popularity for prayers; Agrarian laws for alms; and largesses to the mob instead of donations to saints. -- they have, it is true, often borrowed the vizor of religion; must religion therefore be made their voucher? must that chaste and holy principle be loaded with the infamy of actions, which she had not the smallest concern in giving birth to? must she be rendered responsible for measures, which she was not allowed to direct; and be represented as their adviser of those, by whom she was never consulted? -- What? -- Some men have basely prostituted the name of religion, all men therefore ought to renounce her precepts! some persons, not really under her guidance, have acted wrong, she must therefore no longer teach us to act right! We must strip ourselves of the substance, because {33} others have put on the semblance. Religion, in fine, having been accommodated to bad ends, must on that account, not be permitted to promote good ones[4]. By this mode of reasoning the worthy man, whose signature is counterfeited for the purpose of forgery, ought to suffer capital punishment: and honesty, because personated now and then by hypocrisy, should be proscribed as a species of villany.

PHILO (p. 243.) declares positively that "no periods of time can be happier or more prosperous

than those in which it (religion) is never heard of nor regarded." Before we assent to this proposition, let us recollect, that at no period probably of time whatever was religion so little heard of or regarded, as in the aera immediately preceding the dissolution of the Roman republick.{34} -- In this immaculate aera (let us briefly trace its happiness and prosperity) one man concerted and had nearly executed a general massacre of the supreme magistrates, with a total subversion of a free government. -- Governors of extensive provinces constantly ravaged the unhappy objects of their jurisdiction, with merciless, and more than hostile licentiousness. -- Fortunes of an almost imperial amplitude, vanished daily at the touch of dissipation: while, to repair the mighty ruins, crimes of every complexion and enormity were, without fear or compunction, had recourse to -- one general alone, in pursuit of wealth and power, desolated Gaul, threw his own country into convulsions, nor finished his career till near two millions of his fellow creatures had fallen victims to his ambition. -- Can one meditate without horror on almost any of the principal transactions in PHILO'S golden age! {35} religion had indubitably no concern in those dreadful scenes: and may securely exclaim in the language of our Poet; "Thou canst not say, I did it" -- Let us now suppose for a moment, that religion had actually happened to have interested, in PHILO'S favorite age, the passions of mankind. What would have been the consequence? she would, in all human probability, have been appointed the nominal president, the ostensible high-priestess at the dreadful rites. CAESAR would have been a CROMWELL: would have waved a dagger in one hand, his manual in the other; would have pretended, which he sought only his own aggrandisement, "to seek the Lord[5]. If this imaginary state of things indeed had really taken place; religion, we may be assured, would have been marked by PHILO, as principal instigatress of {36} CAESAR'S worst actions, as the sole mover of his way-ward ambition!

PHILO proceeds (p. 244.) to depreciate the efficacy of future rewards and punishments. "The inference is not just, because finite rewards and punishments have so great influence, that therefore such as are infinite and eternal must have so much greater. Consider, I beseech you, the attachment we have to present things, and the little concern we discover for objects so remote and uncertain. When divines are declaiming against the common behaviour and practice of the world, they always represent this principle as the strongest imaginable (which indeed it is) and describe almost all human kind as lying under the influence of it, and sunk into the deepest lethargy and unconcern about their religious interests. Yet these same divines, {37} when they refute their speculative antagonists, suppose the motives of religion to be so powerful, that, without them, it were impossible for civil society to subsist; nor are they ashamed of so palpable a contradiction." They need not PHILO, be ashamed of it, for it is not, (if my conjectures are right) a contradiction. The meaning of the divines (if I could be referred to their works) would prove, I really believe, consistent. It probably runs thus, sensible objects, take strong and lasting hold of the human mind; and powerfully detach it from the doctrines of eternity: the doctrines of eternity however, by means of exhortation and meditation, do in many instances find entrance into the heart, once admitted they operate potently; mightily convert the inclinations; and prevent numberless enormities. Without their salutary influence, society would be deluged with insufferable profligacy; {38} and be rendered incapable of substituting. -- In opposition to these very rational suggestions of the divines, PHILO remarks (p. 245.) "It is certain from experience, that the smallest grain of natural honesty and benevolence, has more effect on men's conduct, than the most pompous views suggested by theological theories and systems." Supposing, though not admitting, the truth of this position, how PHILO does it answer your present purpose? in what shape does it constitute a plea for the entire renunciation of religion? in recommending the exterminating system, 'tis your

business to prove -- not, that religion has little influence: but, that she has none at all. This latter position however, you will scarce venture absolutely to maintain, after having declared (p. 246) that religion "operates by stars and bounds," that is, that religion has some influence: -- calculate PHILO, the amount of this influence {39} at your discretion: does it direct one half, one third, or one fourth of human agency? deliver your estimate. Morality will accept it at your hands; and rejoice in the friendly tender. SAUL slew his thousands, DAVID his ten thousands; yet, both surely merited the applause of their countrymen. Is the general, who wins five battles, to be disgraced, because another general wins ten? no judicious person, in a word, will, in the great task of curbing human wickedness, reject any, the very slightest, co-operation. -- Aware perhaps of some reasoning of this kind PHILO employs, (p. 246.) in still farther disparaging the energy of the religious principle: representing it as an inert, lifeless spring of action; a monitor, easy to be silenced; a lawgiver, without difficulty eluded; an adviser whom no one pays more attention to, than passion and inclination permit. -- Fully to convince us indeed, {40} that the caput mortuum of religion may be easily dispensed with in society, PHILO peremptorily asserts (p. 247.) that "none but fools ever repose less trust in a man, because they hear, that from study and philosophy, he has entertained some speculative doubts on theological subjects." Notwithstanding this testimonial to the innocency and uprightness of irreligion; which person, in the name of common sense, is most worthy of confidence and dependance; the man, who is restrained solely by a regard to character and interest: or the man, who in addition to the above motives, has the controul likewise of divine vengeance, hanging incessantly, like DAMOCLES'S sword, over his every procedure?

PHILO, not content with detracting from the influence of religion in the article of enforcing virtue, proceeds to accuse her of encouraging vice -- The {41} first species of proof, employed by PHILO in the support of his bold charge, is the exhibition of certain odious, unworthy religious characters. "When we have to do (p. 247) with a man, who makes a great profession of religion and devotion; has this any other effect upon several, who pass for prudent, than to put them on their guard, lest they be cheated and deceived by him?" Again (p. 248) Amongst ourselves some have been guilty of that atrociousness, unknown to the Grecian and Egyptian superstitions, of declaiming, in express terms, against morality." The figure of "pars pro toto," though tolerated in composition, is intolerable in argument. PHILO, in the passages before us, points out certain reprehensible characters, by no means predominant in the religious Drama, and represents them as the principal actors. He would, no doubt, wish us to imagine, {42} that the Pharisaical hypocrite in the first extract, and the unprincipled enthusiast in the second are faithful samples of the generality of religionists: that they have the true family-face: and may serve as models of their brethren.

P. 248. PHILO launches at religion the following invective, "Even though superstition or enthusiasms should not put itself in direct opposition to morality; the very diverting of the attention, the raising up a new and frivolous species of merit, the preposterous distribution which it makes of praise and blame, must have the most pernicious consequences, and weaken extremely men's attachment to the natural motives of justice and humanity." Let us here pause; and bestow a thorough examination upon that "new frivolous species of merit" practical religion: {43} let us ascertain its intrinsic value: let us enquire, if the pretended mass of dross wear not an imperial superscription; be not stamped with a divine image.

FOR the origin of religion I shall appeal solely to the authority[6] of Mr. HUME; who (in his dissertation on the natural history of religion, sect. 4. p. 24,) remarks "That the only point of theology, in which we shall find a consent of mankind almost universal, is, that there is invisible, intelligent power in the world." Again, (sect. 15. p. 114.) "The universal propensity to believe in

invisible, intelligent power, if not an original instinct, being at least a general attendant of human nature, it may be considered as a kind of mark or {44} stamp, which the divine workman has set upon his work -- Before we proceed to decypher this heaven-imprinted character, this hand-writing, as it were, of nature; let us step back for a moment, to the dialogues, and listen to PHILO, haranguing (at p. 228) in the following strain," "That nature does nothing in vain, is a maxim established in all the schools, merely from the contemplation of the works of nature, without any religious purpose; and, from a firm conviction of its truth, an anatomist who had observed a new organ or canal, would never be satisfied till he had also discovered its use and intention." The all-sagacious architect has therefore, surely, not in vain implanted in our nature the religious propensity: nor swerved in this single important instance from her usual maxims of providence. Let us now then endeavour to unfold her {45} counsels in this particular: and develop, as far as we are able, the "use and intention" or final cause, as it is often called, of religion[7] -- The human body, it has been repeatedly observed, is incapable of perpetual exertion. Certain pauses are occasionally requisite to relieve the strained machine, and readjust its disordered springs. All nations accordingly, without exception, have invariably indulged themselves in periodical seasons of relaxation -- A state of inactivity, let it next be remarked, is to men in general, particularly to the lower orders of our species a state of danger. The human mind no sooner stagnates, than it putrefies -- How fortunate then would it be, if mankind could be engaged, {46} during part of their day of the rest in some innocent employment; which might fill up some intervals of a very perilous season unexceptionably; and render leisure, the source of mischief, in some degree innoxious! But how would our satisfaction redouble, if the much-wished for employment should prove not simply inoffensive; but should consist in calling mankind together[8] to the performance of office of a composed, solemn, awful cast; replete with stilness and sobriety; and calculated to settle the heart into a salutary calm. The effect of such a soul-steadying exercise would surely not be entirely momentary; but would follow the mind probably beyond the walls of the temple; and fortify it for some time, against the suggestions of {47} idle levity. To an avocation of the kind here described can every religion under heaven perhaps boast itself to amount -- But if paganism be all this, what is not Christianity? In the religious assemblies of those regions, where the celestial ray of revelation shines with free lustre, we shall hear a heaven-descended performance constantly recited, pregnant with the purest maxims of morality, and rich in interesting displays of future existence -- The very prayers too, in the well-constructed religious assemblies of those regions, will not merely implore divine protection; but will, in doing so, briefly recall to view, the most effectual recommendation to divine protection, moral excellency -- The persuasions of a holy orator will, at the close, reinforce the general impression. From such a fertile field of instruction, from such a matchless school of morality, what barbarians can depart totally unmeliorated? {48} There is no one, I firmly believe scarcely the most hardened, but what carries away from the religious meetings of true protestantism some degree of improvement, some sense of duty. Suppose, with PHILO, that improvement, this sense of duty "to operate by starts and bounds," to prevent bad actions only occasionally, at particular seasons: still will the benefit resulting from them be great, superlative, and inestimable!

BUT PHILO entertains quite different conceptions; and maintains religion to be the parent of evil, rather than of good: more a friend to vice, than virtue -- The instance of the bad tendency of religion, produced by PHILO at p. 249, carries a very striking peculiar air. "Many religious exercises are entered into with seeming fervour, where the heart at the time, feels cold and languid: a habit of dissimulation {49} is by degrees contracted: and fraud and falsehood become the

predominant principle." Concise piece of demonstration! A man performs certain religious offices negligently -- is rendered by that means a hypocrite -- quickly after a complete rogue! when such unbounded licentiousness of inference is freely and unblushingly practised, there seems to be no reason, why one man, as well as another, may not presume to draw conclusions. I will try therefore, if from the same premises, which have afforded PHILO so much scandalous deduction against religion, I cannot derive a position of a dissimilar and perfectly opposite nature. From PHILO'S premise then at the beginning of the above extract I reason, as follows: A consciousness of the described infirmity throws the religionist into a state of humiliation, prostration of soul, and abasement -- which penitential emotions soon terminate in their cogenial {50} habitudes lowliness, and christian meekness -- PHILO, in the concluding sentence of p. 249. carries on his lately-fabricated religious hypocrite through the fiery regions "of the highest zeal in religion and the deepest hypocrisy" till, in the first paragraph of p. 250. the wretch is calcined into "an enthusiastic zealot whom no morality can be forcible enough to bind." That such miscreants, as are here exhibited, have existed, no candid person will deny: but mark: PHILO can reap not the least benefit from the concession, till he prove the generality of religionists to be of a similar diabolical stamp -- PHILO here, as upon a former occasion, lets loose upon us the figure of "Pars pro toto": a most paltry, surely, exceptionable, and inadequate engine of persuasion.

IN the second paragraph of p. 250. PHILO brings forward a most unheard-of {51} accusation against religion, complaining "That the steady attention alone to so important an interest as that of eternal salvation, is apt to extinguish the benevolent affections, and beget a narrow, contracted selfishness." Rather, will not the contemplation of so truly interesting an object as immortal bliss absorp, as it were, the soul; swallow up all its lower attachments; and completely disengage it from the attraction of those sublunary concerns in which selfishness and narrow-mindedness principally center?

I SHALL entirely pass over PHILO'S reflections (p. 251 and 252.) upon the degree of ascendancy and influence, proper to be allowed the priesthood. A discussion of these topics would not materially affect, so far as I can judge, the subject in debate; which is the native excellence and general good {52} tendency of religion. These attributes of religion, if proved, must eternally remain unsullied, unaltered, unimpaired; neither sympathizing with political arrangements; nor susceptible of tarnish from the misconduct of particular priests.

IT has often been urged in favour of religion, that it gives efficacy to oaths. To invalidate this plea, PHILO first (p. 253) represents several circumstances (perfectly independant of religion) as forming "the chief restraint" upon a swearer's tongue. That the circumstances, enumerated by PHILO, have a tendency to enforce truth in depositions, we allow. But has not religion a similar tendency, in an infinitely greater degree? PHILO insinuates, that she has little or none! -- In farther support of his hypothesis, PHILO apprizes us (p. 253) "That custom-house oaths and political oaths are {53} but little regarded even by some who pretend to principles of honesty and religion." From this fact PHILO wishes us, probably, to reason in the following manner: An appeal is equally made to heaven, in custom-house oaths and political oaths, as in other oaths of a more valid nature: the more valid oaths therefore do evidently not derive their validity from that appeal to heaven, which belongs, in an equal degree, to them, and to the invalid custom-house or political oath. To this suggestion let us thus reply; The contempt in which many persons hold the rights of the public,[9] in comparison with the rights of individuals, may {54} easily lead such wrong headed casuists to conceive, that an appeal to heaven, in regard to the former, is less noticed by the most High, than when it relates to the latter branch of rights. These motley moralists, therefore, while they lay no

stress upon the inspection of omniscience in public, may possibly be greatly influenced by a sense of it in private depositions: may, in a work, partially elude, which they by no means totally abjure the belief of celestial cognizance in the transaction of swearing -- Let us farther remark, that the generality of religionists would, it is to be hoped, recoil from the crime of perjury in one scene, no less than in another: at the custom-house, equally as in a court of judicature -- PHILO'S next surmise, (p. 253) in derogation to the utility of religion in attestations, is founded upon the validity of a Quaker's asseveration. PHILO means, no doubt, by this instance, to intimate, that veracity {55} is attainable in depositions, without the help of religious enforcements. An examination however of the fact adduced will decisively forbid any such inference. From what, may we ask, does a Quaker's obstinate adherence to the scheme of simple asseveration proceed, but from an extreme veneration for the authority of scripture? Now the same scripture, which teaches the Quaker, through the medium of erroneous construction, never to exceed the line of simple affirmation, does more clearly and more explicitly teach him never, in his affirmation, to exceed the line of truth. A Quaker's asseveration, is therefore, we may well conclude, often purified by a recollection of scriptural precepts: its veracity, in a word, results, in no small degree, from the influence of religious impression. -- PHILO next endeavours to gainsay that opinion of POLYBIUS, which ascribes the infamy of Greek faith to {56} the prevalency of the EPICUREAN philosophy. "But I know also (replies PHILO p. 254) that PUNIC faith had as bad a reputation in ancient times, as IRISH evidence has in modern; though we cannot account for these vulgar observations by the same reason." But what? Because a commercial spirit of avarice, or any other cause unknown to us, has accidentally engendered habits of perjury; do irreligious tenets, on that account, cease to produce a similar effect? Avarice frequently instigates men to dishonesty, therefore ambition does not. An ordinary fire yields heat, therefore the sun affords none. -- PHILO makes one struggle more (p. 254) to enervate POLYBIUS'S conjecture; attempting to convince us, from a passage in EURIPIDES, {57} "That Greek faith was infamous before the rise of the EPICUREAN philosophy." Without entering into a discussion of the passage in EURIPIDES, let us peremptorily and determinately object to touches of poetry, as competent evidence of national manners. A single well known instance of any crime, existing in a person whom a poet wishes, but is afraid directly to attack, will easily give birth to a poetical effusion of general sarcasm, no way expressive of general truth: The sole purpose of such sarcasm being to glance upon, without seeming to aim at some particular individual; and to insinuate, not avowedly point, a private imputation.

PHILO (p. 256.) vents the following murmur; "The terrors of religion commonly prevail above its comforts. -- It is allowed, that men never have recourse to devotion, so readily as when dejected with grief, or depressed with sickness. Is not this a proof that the religious spirit is not so nearly allied to joy, as to sorrow?" Let us apply the argumentative process {58} of this sentiment, to another strictly similar set of ideas. -- It is allowed that men never have recourse to the offices of friendship, so readily as when dejected with grief, or oppressed with sickness. Is not this a full proof that the spirit of friendship is not so nearly allied to joy, as to sorrow? -- How many things, or, rather how easily may any thing be proved by the admission of such lax reasoning?

In p. 257, 258, 259. PHILO laments that the prospects of a future state, exhibited by popular religions, wear universally a dismal, inauspicious appearance. -- Before we object to this representation, let us briefly remark, that the representation, though admitted, affords no pretence for the renunciation of religion. For if religion as was formerly attempted to be shown, result from a divine impulse, and produce {59} the most extensive benefits, her authoritative practical supremacy will for ever remain unshaken, whatever be the complexion of her future remuneratory

system. Though our attention, in a work, should be unwilling to follow religion, into the other world, it will still be our duty and our interest to adhere to her in this. -- This being premised, let us now, upon very familiar grounds of exception, express unwillingness to hear a single syllable from PHILO, on the subject of a future state. That awful scene, like all other scenes of a mixed chequered nature, is, doubtless, viewed in different lights by different imaginations: chearfulness, supposing criminality our of the question, fixes on the bright, despondency on the cloudy part of the horizon. To the gaiety of PHILO'S temper his picture of human life, examined at the opening of this performance, bears {60} ample testimony. A passage too (in Mr. HUME'S dissertation of the natural history of religion) may serve to throw farther light upon the complexion of PHILO'S posthumous meditations. Mr. HUME (in the passage alluded to, Sect. 15. p. 115.) remarks, "that the most open impiety is attended with a secret dread and compunction." PHILO upon the whole, does not seem a person, to whom any cool dispassionate man, ought to apply for a description of futurity.

PHILO concludes his elaborate declamation against religion, with informing us (p. 259.) "That though this opinion (about future happiness and misery) be seldom so steady in its operation, as to influence all the actions; yet it is apt to make a considerable breach in the temper, and to produce that gloom and melancholy, {61} so remarkable in all devout people." PHILO seems in this passage, to forget a former piece of information of his, (at p. 246.) "That religious motives where they act at all, operate only by starts and bounds; and it is scarcely possible for them to become altogether habitual to the mind." Religious motives, we see (at p. 246.) work only temporary effects: while (at p. 249.) they produce lasting operations. Religious motives indeed, seem in PHILO'S hands to be susceptible, like Milton's angels, of occasional contraction and dilation, just as circumstances require. When we talk of their salutary influence, "They act only (PHILO tells us) by starts and bounds." On a sudden however as soon as PHILO himself handles the pensive tendency of these narrowly operating principles, they swell on the imagination; acquire formidable magnitude; {62} and "make a considerable breach in the temper." -- Without availing ourselves of PHILO'S inconsistency, without endeavouring to render the philosopher an evidence against himself, let us dispassionately enquire into the reality of that gloom and melancholy, ascribed by PHILO to all devout people. -- A short appeal on this topic may first, with propriety, be made to the actual experience of mankind. Are religion and chearfulness, in general incompatible? let every man's personal observation answer the question. -- Let us next remark, that (when the gloom of a religionist arises, as in innumerable instances it certainly does, from natural temper) the religionist, though gloomy with, would indisputably have been so without religion. The unfortunate man carries that within him, which spreads an unvarying shade round his steps: and which, {63} if not exerted upon religious truth, would undoubtedly fasten on and discolour some other object. -- Let us in the last place, ask PHILO this simple but material question: whatever be the nature of the religionist's sorrow, does PHILO tender him a cure? Has sceptical philosophy any balm to comfort the devout heart; any medicine to refresh the religiously-afflicted spirit? let us, in imagination, consign the religionist to PHILO'S direction, and watch the result. -- PHILO, it will here be proper to recollect, launches (at p. 244.) into the following exclamation," consider, "I beseech you, the attachment which we have to present things, and the little concern we discover for objects so remote and uncertain, viz. eternal rewards and punishments." Apply this doctrine to the case of PHILO'S patient. The unhappy man was melancholy from the contemplation of {64} objects remote and uncertain; turned over to PHILO he instantly hears[10] such a horrid representation of things present, as will harrow up his soul, and hurry him into the excesses of phrensy and desperation. He

was anxious while directed by devotion: touched by the wand of infidelity he feels his anxiety redoubled, his horrors infinitely accumulate. Under the influence of religion he moped: under the guidance of PHILO he will perhaps destroy himself.

Pol me occidistis, amici, Non servastis. Hor.

The picture, or rather caricature, of religion, exhibited by PHILO in the dialogues, may perhaps not unhappily be contrasted with a short etching of irreligion, which appears in Mr. HUME'S {65} dissertation on the natural history of religion. Sect. 16. p. 116. "Look out (cries the great philosopher) for a people entirely devoid of religion: If you find them at all, be assured, that they are but few degrees removed from brutes." To what worse state, great and good God, can the strictest profession of thy holy religion reduce us!

[2]I am aware that the topic of human wretchedness is (from p. 174 to p. 185.) frequently handled by DEMEA. But as the assertions of DEMEA on this point (from p. 174 to p. 181.) are (at p. 181.) most cordially assented to by PHILO; and as the remainder of DEMEA'S tragic declamation (down to p. 185.) meets in that page with a similar warm acquiescence from his friend; we may surely venture to set down PHILO a complete proselyte to the dismal creed.

[3]What PHILO means by vulgar superstition may be learnt from p. 244. CLEANTHES there remarks, "That when religion distinguishes itself and acts as a separate principle over men, it has departed from its proper sphere, and has become only a cover to faction and ambition." To this PHILO replies "And so will all religion, except the philosophical and rational will become the cover to faction and ambition. To be the cover of faction and ambition is, in the ordinary acceptation of the words, to be the source of all the mischiefs ascribed to vulgar superstition in the present page. All religion therefore, except the philosophical and rational, is evidently, in PHILO'S view of things, vulgar superstition.

The professors of philosophical religion are said (p. 261) to be extremely few. The faith of these professors is represented (at p. 262) as centering entirely in one solitary speculative tenet, which (to use the very words there employed in characterizing it) "affords no inference that can affect human life, or can be the source of any action or forbearance," so simple a code of divinity can evidently not incumber its proselytes with temples, modes of worship, or fear of heavenly power.

The professors of this pure theology are of course easy to be distinguished. These pure theologists, once distinguished, negatively ascertain to us the vulgarly superstitious part of mankind, namely all other persons, except atheists, and these contemplative single-teneted religionists.

[4]The inestimable benefits resulting from religion will be displayed in a subsequent paragraph.

[5]A favorite expression of CROMWELL.

[6]Better authority might, doubtless, be produced: but none, probably, so satisfactory to PHILO.

[7]Though my conjectures on this momentous subject should not be deemed satisfactory, still let it be remembered, that the religious propensity, according to the well-founded maxim of the schools quoted by PHILO, indisputably has a final cause.

[8]Mere association, if regulated by decorum, has a most efficacious tendency, in the opinion of intelligent judges, to civilize and polish the human race.

[9]The interests of the community are certainly, though one scarce knows upon what ground, deemed far less sacred by the generality of mankind, than the rights of individuals. Many persons, for instance, of unquestionable honesty in private concerns, will, without shame or scruple, engage in the purchase or disposal of contraband commodities, though such practices are palpable, indisputable frauds upon the interests of the community.

[10]See PHILO'S lamentations over the miseries of life, discussed at the beginning of this performance.

"An Examination of Hume's Essay on Justice"

European Magazine and London Review

1793

Editor's note: This anonymously written essay attacks Hume's claim that justice is an artificially instilled virtue. The author begins distinguishing between optional virtues, such as charity, and obligatory ones, especially justice which is necessary for the existence of society. For Hume, justice is artificial, deriving not from "the constitution of human nature" but "from the association of mankind together." Contrary to Hume, the author argues that justice is natural. Justice lies between favor and in jury. "A favour naturally produces gratitude. An injury, if done to ourselves, produces resentment...." Justice involves the idea of things which are due or not due, and such ideas are no less natural than gratitude. Gratitude and resentment, which corres pond to favor and injury, "are acknowledged by Mr. HUME himself to be natural...," hence justice too must be natural.

"An Examination of Hume's Essay on Justice"

European Magazine and London Review
1793, Vol. 24, pp. 422-424

{422}

THE general distinction between Virtue and Vice is sufficiently known to all men. There are certain actions which are universally the objects of approbation, which we call good, virtuous, or praise-worthy. There are other actions which are universally the objects of disapprobation, which

we call bad or vicious; and which seem in many cases to deserve punishment. The consideration of Virtue and vice, and the questions relating to them, make up what is called the science of Ethics or Morals.

When we consider the general distinction between virtue and Vice; when we consider certain virtues on the one hand, and certain vices on the other, they evidently appear to admit of a subdivision. There are many virtues which are altogether left to o ur own choice -- where we are at liberty to practise them or not as we please. A man is apprehended to act improperly when he is a miser; on the contrary, he is approved of when he acts generously: but it is never apprehended that we can with propriety fo rce him to act in the one way or in the other. We do not think that we can force a miser to be generous. {434}

On the other hand, there are certain virtues which are the proper objects of compulsion; or certain vices which may with propriety be restrained. It is a virtuous action for men to pay their just debts; but if they refuse to pay them, force may be us ed in order to extort the observance of this virtue, or to avoid the contrary vice, which is precisely the same thing in another point of view. Here then are two different classes of virtues, where the agent is at liberty to practise them or not; and wher e, in other cases, he may be compelled to observe them. This makes the distinction between Justice and the other Virtues. These rules of conduct, which a person may be forced to observe, belong, properly speaking, to Justice, and make the object of Law. T hose rules of action where no force is used, make properly the subject of Ethics. Hence it is evident that Justice is a species of Virtue. Virtue in general comprehends Justice as well as many other particular virtues; but all the other virtues are in a d ifferent situation from justice in this respect -- that we may practise them or not as we please.

Justice implies that we invade no man's property, nor violate his rights; that we do not injure him in his person, in his family, or in his good name: that we pay our just debts; that we make reparation to the best of our power for any damage we have done, or offence we may have given to others; that we fulfil our contracts, and be faithful to our promises; that we use no fraudulent dealings, nor take advantage of the weakness, ignorance, or necessity of those with whom we deal; and, in a word, that we be fair, honest, and without guile in our speech and behaviour. These, and matters of a like nature, constitute what we call fair-dealing, honesty, integrity. Justice is opposed both to violence and to deceit. So necessary is Justice to the very being of human society, that without it there could be no society at all. And it has been very justly observed, even by the most ancient authors, that those gangs of thieves and robbers who pay no regard to the rights of other men, must observe the rules of Jus tice towards one another, otherwise they could not possibly keep together. It would be more safe, as well as more comfortable, for a man to renounce all human society, and to live as an hermit in the wilderness, or to dwell with the beasts of the field, t han with men who paid no regard to justice. It is chiefly with a view to defend themselves from injury, that men associate together and form human societies. The first end of all Governments, and the chief object of all human Laws, is to secure men from u njust violations of their rights by violence or fraud, and to deter men by punishments from all such violations of the rights of others.

Having said these things, I shall take notice of an opinion which HUME has advanced, and endeavoured with all his eloquence and reasoning to support, that Justice is not a natural but an artificial virtue. It is not a virtue whic h the constitution of human nature points out to us of itself, but which, from the association of mankind together, appears to be necessary for human society, and is regulated entirely by its use. Nothing therefore, according to him, is just or unjust by nature; but what is for the benefit of society is on this account called just, and what has the

contrary tendency is called unjust.

In order to throw some light on this subject, it may be proper first to explain, as distinctly as possible, the notion we annex to this word JUSTICE, and then consider Mr. Hume's reasoning to shew that it is not a natural virtue. As men, we are endowed by nature with powers, in the exercise of which we may do good or evil to our fellow men. When we employ our powers to promote the good and happiness of others, this is beneficence or favour. When we exert our powers to hurt them, this is injury. Justice lies in the middle between these two. It is such a conduct as does no hurt to others, though at the same time it does them no favour. Now the idea of a favour on the one hand, and of an injury on the other, are so universal, that i t may justly be doubted, whether ever there was a man come to years of understanding who never had in his mind the notion of a favour and of an injury -- of a good office and of a bad one. These notions discover themselves in all men, not by language only , but by certain affections of mind of which they are the natural objects. A favour naturally produces gratitude. An injury, if done to ourselves, produces resentment; and when done to others excites indignation. Now it is acknowledged by all, and I appre hend by Mr. HUME himself, that gratitude and resentment are natural ingredients {424} the human mind, no less than the appetites of hunger and thirst; and these passions are as naturally excited by their proper objects as these appeti tes. This indeed is so evident in itself, that it would be impertinent to offer an argument for it, as no philosopher, as far as I know, ever denied it. It is evident that the proper object of gratitude is one who has done us a favour, and the proper obje ct of resentment is a person who has done us an injury. Every sentiment of gratitude implies in its nature a conception and belief of a favour done by the person who is the object of our gratitude; and every sentiment of resentment implies in its nature a belief of an injury done by the person who is the object of our resentment. What is it then which we call a favour, and which by the very constitution of human nature excites the natural sentiment of gratitude? No man who is capable of reflecting on the operations of his own mind, can be at any loss to answer this question. An action which produces pleasure or advantage to me, is not a favour unless that advantage or pleasure was intended. We are told of a Physician who gave a medicine to his patient wit h an intention to poison him; that the medicine, however, contrary to the intention of the Physician, cured the disease. There was surely no gratitude due by the patient when he knew the real state of the case. It is evident to every man, that a benefit a rising from the action of another, either against or without his intention, cannot move to gratitude.

Another thing implied in a favour is, that it be not due. A man may save my credit by paying what he owes me, and in this case the thing which he does tends to my benefit, yet it is not a favour. It is no more than he is bound to do. A servant does h is work, and receives his wages -- this is no favour. Now what we may observe from this is, that the conception of favour includes in it the conception of a thing not due. A negative cannot be conceived by one who has no conception of the corresponding po sitive. Not to be due is the negative of being due; and he who conceives the first must conceive the last. The idea of things due or not due must be conceived by every one who has any sentiments of gratitude, and therefore not less natural then the sentim ent of gratitude is, because no gratitude is due; nor is any raised naturally in the mind, unless where some good is done that was not due.

Let us consider, on the other hand, that which we call an injury, and which I conceive to be the natural object of resentment. Every man who is capable of looking into his own heart, conceives an injury implies something more than receiving hurt. If I am hurt by a stone falling out of the wall, or by a flash of lightning, or by an involuntary motion in another man's arm, no injury is done, no

resentment is raised. In this, as well as in all other immoral actions, there must be will and intention in t he agent to do the hurt. Nor is this sufficient to constitute an injury. A man who treads down my corn, or breaks down my fences, in order to fly from danger, when he as no ill intentions, and is willing to indemnify me for the hurt, is not injurious, nor is he the object of resentment. The executioner who only does his duty in cutting off the head of a condemned criminal, is not the object of punishment. He is not injurious. He does nothing unjust. For it is evident that injury, which is the natural obje ct of resentment, implies in it the notion of injustice; and no man can have the notion of injustice without having the notion of justice. It appears therefore, I think, from what has been said, that the notion of justice is no less natural to the human m ind than the notion of a favour, or of an injury no less natural than the affection of gratitude and resentment. These three, to wit, a favour, an act of justice, and an injury are so related to each other, that he who conceives one of them must conceive all: they lie all, as it were, in one line, and resemble the three ratios of -- greater, middle, and less. He who understands what is meant when one line is called less or greater than another, can be a no loss to know what is meant by one line being equa l to another; for if it is neither greater nor less, it must be equal. A favour is more than justice, an injury is less; and that which is neither a favour nor an injury, is a just action: for in every state of society in which there is gratitude for good offices, or resentment for injuries, there must be a notion of justice; and this notion of justice is as natural to man as the notion of favour or injury, consequently as natural as the emotions of gratitude and resentment. But these are acknowledged by Mr. HUME himself to be natural; and if they are, it necessarily follows that the notion of justice must be so also, which is the thing that was to be proved.

Hume on Miracles

A View of the Evidences of Christianity

William Paley

1794

Editor's note: William Paley (1743-1805) was archdeacon of Carlisle, and the author of three influential books in philosophy and philosophical theology: *The Principles of Moral and Political Philosophy* (1785), *A View of the Evidences of Christianity* (1794), and *Natural Theology* (1802). Paley's *View* is a defense of Christianity based on prophesy, the candor of the New Testament writings, and the "undesigned coincidence" between the events as reported in Acts and Paul's letters. Part 1 (of its three parts) opens and closes with an analysis of Hume's essay on miracles; no additional references to Hume occur between the opening and closing. In the opening Preparatory Considerations to Part 1, Paley attacks Hume's argument against miracles from universal experience: "The force of experience as an objection to miracles is founded in the presumption, either that the course of nature is invariable, or that, if it be ever varied, variations will be frequent and general." Paley questions whether these two alternatives are the only possible choices. The closing of Part 1 examines Hume's examples of alleged miracles, such as those at the tomb of the Abbe Paris, and explains why they are not credible accounts (Part 1, Proposition 2, Chapter 2). All of the review journals responded favourably to Paley's *View*. The *Analytical Review* notes generally that "no popular view of the evidences of christianity has hitherto been given, at once so judicious in the selection and arrangement of materials, so happy in illustration, and so well supported by citations..." (1795, Vol. 20, pp. 185-196). The *Edinburgh Magazine* expresses their happiness that "Dr. P. has been rewarded by his Ecclesiastical Superiors... in a munificent and honourable manner for his learned labours" (1995, Vol. 27, pp. 313-318, 384-390). The "rewards" referred to were several preferments involving a prebend at 150L yearly, a subdeanery at 700L yearly, and a rectory at 1,200L yearly. "May Mr. Paley Long live to enjoy what he so amply possesses!" hails the *Critical Review* (1795, Vol. 14, pp. 371-380). As to Paley's treatment of Hume, the *Monthly Review* comments that "no objection against revelation has ever, perhaps, made a more general impression among philosophers than this [i.e. Hume's essay], and... Mr. Paley has, in our opinion,

been particularly successful in his reply to it..." (1795, Vol. 17, pp. 404-411). Paley's *View* was republished dozens of times within the first few decades of its appearance. The following is from the 1796 and fifth edition (London: R Faulder, Vol. 1, pp. 1-15, 369-383).

A View of the Evidences of Christianity in Three Parts Preparatory Considerations.

I DEEM it unnecessary to prove that mankind stood in need of a revelation, because I have met with no serious person who thinks that even under the Christian revelation we have too much light, or any degree of assurance which is superfluous. I desire moreover that in judging of Christianity it may be remembered, that the question lies between this religion and none: for, if the Christian religion be not credible, no one, with whom we have to do, will support the pretensions of any other.

Suppose then the world we live in to have had a Creator; suppose it to appear from the predominant aim and tendency of the provisions and contrivances observable in the universe, that the Deity, when he formed it, consulted for the happiness of his sensitive creation; suppose the disposition which dictated this council to continue: suppose a part of the creation to have received faculties from their Maker, by which they are capable of rendering a moral obedience to his will, and of voluntarily pursuing any end for which he has designed them; suppose the Creator to intend for these his rational and accountable agents a second state of existence in which their situation will be regulated by their behaviour in the first state, by which supposition (and by no other) the objection to the divine government in not putting a difference between the good and the bad, and the inconsistency of this confusion with the care and benevolence discoverable in the works of the Deity is done away; suppose it to be of the utmost importance to the subjects of this dispensation to know what is intended for them, that is, suppose the knowledge of it to be highly conducive to the happiness of the species, a purpose which so many provisions of nature are calculated to promote: Suppose, nevertheless, almost the whole race, either by the imperfection of their faculties, the misfortune of their situation, or by the loss of some prior revelation, to want this knowledge, and not to be likely without the aid of a new revelation to attain it; under these circumstances is it improbable that a revelation should be made? Is it incredible that God should interpose for such a purpose? Suppose him to design for mankind a future state, is it unlikely that he should acquaint them with it?

Now in what way can a revelation be made but by miracles? In none which we are able to conceive. Consequently, in whatever degree it is probable or not very improbable that a revelation should be communicated to mankind at all, in the same degree is it probable or not very improbable that miracles should be wrought. Therefore, when miracles are related to have been wrought in the promulgating of a revelation manifestly wanted, and, if true, of inestimable value, the improbability which arises from the miraculous nature of the things related, is not greater than the original improbability that such a revelation should be imparted by God.

I wish it however to be correctly understood, in what manner, and to what extent, this argument is alledged. We do not assume the attributes of the Deity, or the existence of a future state, in order to

prove the reality of miracles. That reality always must be proved by evidence. We assert only, that in miracles adduced in support of revelation there is not any such antecedent improbability as no testimony can surmount. And for the purpose of maintaining this assertion, we contend, that the incredibility of miracles related to have been wrought in attestation of a message from God, conveying intelligence of a future state of rewards and punishments, and teaching mankind how to prepare themselves for that state, is not in itself greater than the event, call it either probable or improbable, of the two following propositions being true: namely, first, that a future state of existence should be destined by God for his human creation; and, secondly, that, being so destined, he should acquaint them with it. It is not necessary for our purpose that these propositions be capable of proof, or even that, by arguments drawn from the light of nature, they can be made out to be probable. It is enough that we are able to say concerning them, that they are not so violently improbable, so contradictory to what we already believe of the Divine power and character, that either the propositions themselves, or facts strictly connected with the propositions (and therefore no farther improbable than they are improbable), ought to be rejected at first sight, and to be rejected by whatever strength or complication of evidence they be attested.

This is the prejudication we would resist. For to this length does a modern objection to miracles go, viz. that no human testimony can in any case render them credible. I think the reflection above stated, that, if there be a revelation, there must be miracles; and that, under the circumstances in which the human species are placed, a revelation is not improbable, or not improbable in any great degree, to be a fair answer to the whole objection.

But since it is an objection which stands in the very threshold of our argument, and, if admitted, is a bar to every proof, and to all future reasoning upon the subject, it may be necessary, before we proceed farther, to examine the principle upon which it professes to be founded: which principle is concisely this, that it is contrary to experience that a miracle should be true, but not contrary to experience that testimony should be false.

Now there appears a small ambiguity in the term "experience," and in the phrases "contrary to experience," or "contradicting experience," which it may be necessary to remove in the first place. Strictly speaking, the narrative of a fact is _then_ only contrary to experience, when the fact is related to have existed at a time and place, at which time and place we being present did not perceive it to exist; as if it should be asserted, that in a particular room and at a particular hour of a certain day, a man was raised from the dead, in which room, and at the time specified, we being present and looking on perceived no such event to have taken place. Here the assertion is contrary to experience properly so called; and this is a contrariety which no evidence can surmount. It matters nothing, whether the fact be of a miraculous nature or not. But although this be the experience, and the contrariety, which Archbishop Tillotson alledged in the quotation with which Mr. Hume opens his essay, it is certainly not that experience, nor that contrariety, which Mr. Hume himself intended to object. And, short of this, I know no intelligible signification which can be affixed to the term "contrary to experience," but one, viz. that of not having ourselves experienced any thing similar to the thing related, or such things not being generally experienced by others. I say "not generally;" for to state concerning the fact in question, that no such thing was ever experienced, or that _universal_ experience is against it, is to assume the subject of the controversy.

Now the improbability which arises from the want (for this properly is a want, not a contradiction) of experience, is only equal to the probability there is, that, if the thing were true, we should experience things similar to it, or that such things would be generally experienced. Suppose it then

to be true that miracles were wrought upon the first promulgation of Christianity, when nothing but miracles could decide its authority, is it certain that such miracles would be repeated so often, and in so many places, as to become objects of general experience? Is it a probability approaching to certainty? Is it a probability of any great strength of force? Is it such as no evidence can encounter? And yet this probability is the exact *converse*, and therefore the exact measure of the improbability which arises from the want of experience, and which Mr. Hume represents as invincible by human testimony.

It is not like alledging a new law of nature, or a new experiment in natural philosophy, because, when these are related, it is expected that, under the same circumstances, the same effect will follow universally; and in proportion as this expectation is justly entertained, the want of a corresponding experience negatives the history. But to expect concerning a miracle that it should succeed upon repetition, is to expect that which would make it cease to be a miracle, which is contrary to its nature as such, and would totally destroy the use and purpose for which it was wrought.

The force of experience as an objection to miracles is founded in the presumption, either that the course of nature is invariable, or that, if it be ever varied, variations will be frequent and general. Has the necessity of this alternative been demonstrated? Permit us to call the course of nature the agency of an intelligent Being, and is there any good reason for judging this state of the case to be probable? Ought we not rather to expect, that such a Being, upon occasions of peculiar importance, may interrupt the order which he had appointed, yet, that such occasions should return seldom; that these interruptions consequently should be confined to the experience of a few; that the want of it, therefore, in many, should be matter neither of surprise nor objection?

But as a continuation of the argument from experience it is said, that, when we advance accounts of miracles, we assign effects without causes, or we attribute effects to causes inadequate to the purpose, or to causes of the operation of which we have no experience. Of what causes, we may ask, and of what effects does the objection speak? if it be answered that, when we ascribe the cure of the palsy to a touch, of blindness to the anointing of the eyes with clay, or the raising of the dead to a word, we lay ourselves open to this imputation; we reply, that we ascribe no such effects to such causes. We perceive no virtue or energy in these things more than in other things of the same kind. They are merely signs to connect the miracle with its end. The effect we ascribe simply to the volition of the Deity; of whose existence and power, not to say of whose presence and agency, we have previous and independent proof. We have therefore all we seek for in the works of rational agents, a sufficient power and an adequate motive. In a word, once believe that there is a God, and miracles are not incredible.

Mr. Hume states the case of miracles to be a contest of opposite improbabilities, that is to say, a question whether it be more improbable that the miracle should be true, or the testimony false; and this I think a fair account of the controversy. But herein I remark a want of argumentative justice, that, in describing the improbability of miracles, he suppresses all those circumstances of extenuation, which result from our knowledge of the existence, power, and disposition of the Deity, his concern in the creation, the end answered by the miracle, the importance of that end, and its subserviency to the plan pursued in the work of nature. As Mr. Hume has represented the question, miracles are alike incredible to him who is previously assured of the constant agency of a divine Being, and to him who believes that no such being exists in the universe. They are equally incredible, whether related to have been wrought upon occasions the most deserving, and for purposes the most beneficial, or for no assignable end whatever, or for an end confessedly trifling

or pernicious. This surely cannot be a correct statement. In adjusting also the other side of the balance, the strength and weight of testimony, this author has provided an answer to every possible accumulation of historical proof by telling us, that we are not obliged to explain how the story or the evidence arose. Now I think that we *are* obliged; not, perhaps, to shew by positive accounts how it did, but by a probable hypothesis how it might so happen. The existence of the testimony is a phenomenon. The truth of the fact solves the phenomenon. If we reject this solution, we ought to have some other to rest in; and none even by our adversaries can be admitted, which is not consistent with the principles that regulate human affairs and human conduct at present, or which makes men *then* to have been a different kind of beings from what they are now.

But the short consideration which, independently of every other, convinces me that there is no solid foundation in Mr. Hume's conclusion is the following. When a theorem is proposed to a mathematician, the first thing he does with it is to try it upon a simple case; and, if it produce a false result, he is sure that there must be some mistake in the demonstration. Now to proceed in this way with what may be called Mr. Hume's theorem. If twelve men, whose probity and good sense I had long known, should seriously and circumstantially relate to me an account of a miracle wrought before their eyes, and in which it was impossible that they should be deceived; if the governor of the country, hearing a rumour of this account, should call these men into his presence, and offer them a short proposal, either to confess the imposture, or submit to be tied up to a gibbet; if they should refuse with one voice to acknowledge that there existed any falsehood or imposture in the case; if this threat were communicated to them separately, yet with no different effect; if it was at last executed; if I myself saw them, one after another, consenting to be racked, burnt, or strangled, rather than give up the truth of their account; still, if Mr. Hume's rule be my guide, I am not to believe them. Now, I undertake to say that there exists not a sceptic in the world who would not believe them; or who would defend such incredulity.

Instances of spurious miracles supported by strong apparent testimony undoubtedly demand examination. Mr. Hume has endeavoured to fortify his argument by some examples of this kind. I hope in a proper place to shew that none of them reach the strength or circumstances of the Christian evidence. In these, however, consists the weight of his objection. In the principle itself I am persuaded there is none.

PART I

PROPOSITION II.

CHAP. II.

But they, with whom we argue, have undoubtedly a right to select their own examples. The instances with which Mr. Hume hath chosen to confront the miracles of the New Testament, and which, therefore, we are entitled to regard as the strongest which the history of the world could supply to the enquiries of a very acute and learned adversary, are the three following:

1. The cure of a blind and of a lame man at Alexandria, by the Emperor Vespasian, as related by Tacitus;
2. The restoration of the limb of an attendant in a Spanish church, as told by Cardinal de Retz; and
3. The cures said to be performed at the tomb of the Abbe Paris, in the early part of the present century.

1. The narrative of Tacitus is delivered in these terms: "One of the common people of Alexandria, known to be diseased in his eyes, by the admonition of the god Serapis, whom that superstitious nation worship above all other gods, prostrated himself before the emperor, earnestly imploring from his a remedy for his blindness, and entreating that he would deign to anoint with his spittle his cheeks and the balls of his eyes. Another, diseased in his hand, requested, by the admonition of the same god, that he might be touched by the foot of the emperor. Vespasian at first derided and despised their application; afterwards when they continued to urge their petitions, he, sometimes, appeared to dread the imputation of vanity; at other times, by the earnest supplication of the patients, and the persuasion of his flatterers, to be induced to hope for success. At length he commanded an enquiry to be made by the physicians, whether such a blindness and debility were vincible by human aid. The report of the physicians contained various points; that in the one the power of vision was not destroyed, but would return if the obstacles were removed; that, in the other, the diseased joints might be restored, if a healing power were applied; that it was, perhaps, agreeable to the gods to do this; that the emperor was elected by divine assistance; lastly, that the credit of the success would be the emperor's, the ridicule of the disappointment would fall upon the patients. Vespasian, believing that every thing was in the power of his fortune, and that nothing was any longer incredible, whilst the multitude, which stood by, eagerly expected the event, with a countenance expressive of joy executed what he was desired to do. Immediately the hand was restored to its use, and light returned to the blind man. They who were present, relate both these cures, even at this time, when there is nothing to be gained be lying."[2]

Now, though Tacitus wrote this account twenty-seven years after the miracle is said to have been performed, and wrote at Rome of what passed at Alexandria, and wrote also from report; and although it does not appear that he had examined the story, or that he believed it (but rather the contrary), yet I think his testimony sufficient to prove that such a transaction took place; by which I mean that the two men in question did apply to Vespasian; that Vespasian did touch the diseased in the manner related; and that a cure was reported to have followed the operation. But the affair labours under a strong and just suspicion, that the whole of it was a concerted imposture brought about by collusion between the patients, the physician, and the emperor. This solution is probable, because there was every thing to suggest, and every thing to facilitate such a scheme. The miracle was calculated to confer honour upon the emperor, and upon the god Serapis. It was achieved in the midst of the emperor's flatterers and followers; in a city, and amongst a populace, beforehand devoted to his interest, and to the worship of the god; where it would have been treason and blasphemy together to have contradicted the fame of the cure, or even to have questioned it. And what is very observable in the account is, that the report of the physicians is just such a report as would have been made of a case, in which no external marks of the disease existed, and which, consequently, was capable of being easily counterfeited, viz. that in the first of the patients, the organs of vision were not destroyed, that the weakness of the second was in his joints. The strongest circumstance in Tacitus's narration is, that the first patient was "*notus* tabe aculorum," remarked or notorious for the disease in his eyes. But this was a circumstance which might have found its way into the story in its progress from a distant country, and during an interval of thirty years; or it might be true that the malady of the eyes was notorious, yet that the nature and degree of the disease had never been ascertained: a case by no means uncommon. The emperor's reserve was easily affected; or it is possible he might not be in the secret. There does not seem to be much weight in the observation of Tacitus, that they who were present continued even then to relate the story when there was nothing to be gained by the lie. It only proves that those who had told the

story for many years, persisted in it. The state of mind of the witnesses and spectators *at the time,* is the point to be attended to. Still less is there of pertinency in Mr. Hume's eulogium upon the cautious and penetrating genius of the historian; for it does not appear that the historian believed it. The terms in which he speaks of Serapis, the deity to whose interposition the miracle was attributed, scarcely suffer us to suppose that Tacitus thought the miracle to be real, "by the admonition of the god Serapis, whom that superstitious nation (dedita superstitionibus gens) worship above all other gods." To have brought this supposed miracle within the limits of comparison with the miracles of Christ, it ought to have appeared, that a person of a low and private station, in the midst of enemies, with the whole power of the country opposing *him*, with every one around him prejudiced or interested against his claims and character, pretended to perform these cures; and required the spectators, upon the strength of what they saw, to give up their firmest hopes and opinions, and follow him through a life of trial and danger; that many were so moved, as to obey his call, at the expence, both of every notion in which they had been brought up, and of their ease, safety and reputation; and that by these beginnings a change was produced in the world, the effects of which remain to this day: a case, both in its circumstances and consequences, very unlike any thing we find in Tacitus's relation.

2. The story taken from the memoirs of Cardinal de Retz, which is the second example alledged by Mr. Hume, is this: "In the church of Saragossa in Spain, the canons shewed me a man whose business it was to light the lamps, telling me that he had been several years at the gate, with one leg only. I saw him with two."[3]

It is stated by Mr. Hume, that the Cardinal who relates this story, did not believe it; and it no where appears that he either examined the limb, or asked the patient, or indeed any one, a single question about the matter. An artificial leg wrought with art would by sufficient, in a place where no such contrivance had ever before been heard of, to give origin and currency to the report. The ecclesiastics of the place would, it is probable, favour the story, inasmuch as it advanced the honour of their image and church. And if *they* patronized it, no other person at Saragossa, in the middle of the last century, would care to dispute it. The story likewise coincided, not less with the wishes and preconceptions of the people, than with the interests of their ecclesiastical rulers: so that there was prejudice backed by authority, and both operating upon extreme ignorance, to account for the success of the imposture. If, as I have suggested, the contrivance of an artificial limb was then new, it would not occur to the Cardinal himself to suspect it; especially under the carelessness of mind with which he heard the tale, and the little inclination he felt to scrutinize or expose its fallacy.

3. The miracles related to have been wrought at the tomb of the Abbe' Paris, admit in general of this solution. The patients who frequented the tomb, were so affected by their devotion, their expectation, the place, the solemnity, and, above all, by the sympathy of the surrounding multitude, that many of them were thrown into violent convulsions, which convulsions, in certain instances, produced a removal of disorders depending upon obstruction. We shall, at this day, have the less difficulty in admitting the above account, because it is the very same thing as hath lately been experienced in the operations of animal magnetism; and the report of the French physicians upon that mysterious remedy is very applicable to the present consideration, viz. that the pretenders to the art, by working upon the imaginations of their patients, were frequently able to produce convulsions; that convulsions so produced are amongst the most powerful, but, at the same time, most uncertain and unmanageable applications to the human frame, which can be employed.

Circumstances, which indicate this explication in the case of the Parisian miracles, are the

following:

> **1. They were *tentative*. Out of many thousand sick, infirm, and diseased persons, who resorted to the tomb, the professed history of the miracles contains only nine cures.**
> **2. The convulsions at the tomb are admitted.**
> **3. The diseases were, for the most part of that sort, which depends upon inaction and obstruction, as dropsies, palsies, and some tumours.**
> **4. The cures were gradual; some patients attending many days, some several weeks, and some several months.**
> **5. The cures were many of them incomplete.**
> **6. Others were temporary.[4]**

So that all the wonder we are called upon to account for is, that out of an almost innumerable multitude which resorted to the tomb for the cure of their complaints, and many of whom were there agitated by strong convulsions, a very small proportion experienced a beneficial change in their constitution, especially in the action of the nerves and glands.

Some of the cases alledged do not require that we should have recourse to this solution. The first case in the catalogue is scarcely distinguishable from the progress of a natural recovery. It was that of a young man, who laboured under an inflammation of one eye, and had lost the sight of the other. The inflamed eye was relieved, but the blindness of the other remained. The inflammation had before been abated by medicine; and the young man, at the time of this attendance at the tomb was using a lotion of laudanum. And, what is a still more material part of the case, the inflammation after some interval returned. Another case was that of a young man who had lost his sight by the puncture of an awl, and the discharge of the aqueous humour through the wound. The sight, which had been gradually returning, was much improved during his visit to the tomb, that is, probably in the same degree in which the discharged humour was replaced by fresh secretions. And it is observable, that these two are the only cases, which, from their nature, should seem unlikely to be affected by convulsions.

In one material respect I allow, that the Parisian miracles were different from those related by Tacitus, and from the Spanish miracle of the Cardinal de Retz. They had not, like them, all the power and all the prejudice of the country on their side to begin with. They were alledged by one party against the another, by the Jansenists against the Jesuits. These were of course opposed and examined by their adversaries. The consequence of which examination was, that many falsehoods were detected, that with something really extraordinary much fraud appeared to be mixed. And if some of the cases, upon which designed misrepresentation could not be charged, were not at the time satisfactorily accounted for, it was because the efficacy of strong spasmodic affections was not then sufficiently known. Finally, the cause of Jansenism did not rise by the miracles, but sunk, although the miracles had the anterior persuasion of all the numerous adherents of that cause to set out with.

These, let us remember, are the strongest examples, which the history of ages supplies. In none of them was the miracle unequivocal; by none of them were established prejudices and persuasions overthrown; of none of them did the credit make its way, in opposition to authority and power; by none of them were many induced to commit themselves, and that in contradiction to prior opinions, to a life of mortification, danger, and sufferings; none were called upon to attest them, at the expence of their fortunes and safety.[5]

[2]Tac. Hist. lib. iv.

[3]Liv. iv. A.D. 1654.

[4]The reader will find these particulars verified in the detail, by the accurate enquiries of the present bishop of Sarum in his Criterion of miracles, p. 132 et seq.

[5]It may be thought that the historian of the Parisian miracles, M. Montgeron, forms an exception to this last assertion. He presented his book (with a suspicion, as it should seem, of the danger of what he was doing) to the king; and was shortly afterwards committed to prison, from which he never came out. Had the miracles been unequivocal, and had M. Montgeron been originally convinced by them, I should have allowed this exception. It would have stood I think, alone, in the argument of our adversaries. But beside what has been observed of the dubious nature of the miracles, the account which M. Montgeron has himself left of his conversion, shews both the state of his mind, and *that his persuasion was no built upon external miracles*. "Scarcely had he entered the church-yard, when he was struck," he tells us, "with awe and reverence, having never before heard prayers pronounced with so much ardour and transport, as he observed amongst the supplicants at the tomb. Upon this, throwing himself on his knees, resting his elbows on the tomb-stone, and covering his fact with his hands, he spake the following prayer: *O thou, by whose intercession so many miracles are said to be performed, if it be true that a part of thee surviveth the grave, and that thou hast influence with the Almighty, have pity on the darkness of my understanding, and through his mercy obtain the removal of it*. Having prayed thus, "many thoughts," as he sayeth, "began to open themselves to his mind; and so profound was his attention that he continued on his knees four hours, not in the least disturbed by the vast crowd of surrounding supplicants. During this time all the arguments which he had ever heard or read in favour of Christianity, occurred to him with so much force, and seemed so strong and convincing, that he went home fully satisfied of the truth of religion in general, and of the holiness and power of that person, who," as he supposed, "had engaged the divine goodness to enlighten his understanding so suddenly." The Hume Archives

"On Mr. Hume's Account of the Origin of the Idea of Necessary Connection"

Monthly Magazine

H. Richter

1797

Editor's note: The author of this essay, H. Richter, is probably Henry James Richter (1772-1857), London born painter and philosopher. Richter was an intimate friend of William Blake and, like Blake had both artistic and literary interests. He was influenced by Kant, and his other writings include *Daylight, a recent Discovery in the Art of Painting, with Hints on the Philosophy of the Fine Arts, and on that of the Human Mind, as first dissected by Emmanuel Kant* (1817). Richter's essay on Hume's account of the origin of the idea of necessary connection was written when he was 25 and reflects an early phase in his philosophical development, in view of his concluding comment which recommends the rejection of Kant. In this essay Richter argues that neither habit, instinct, nor a renewed propensity can account for either the idea of necessary connection or the belief. However, he believes that there is value in tracing the origin of such ideas.

1797, Vol. 4, pp. 533-536

{533}

To the Editor of the Monthly Magazine.

ON MR. HUME'S ACCOUNT OF THE ORIGIN OF THE IDEA OF NECESSARY CONNECTION.

SIR,

THE principal means by which Mr. Hume proposes to "banish all that jargon, which has so long taken possession of metaphysical reasonings, and drawn disgrace upon them," is the following: "all our ideas, or more feeble perceptions, are copies of our impressions, or more lively ones." This he lays down as a general rule, and requires those who assert that it is not universal, to produce an instance of some idea which is to derived from any impression. In the mean time, however, he takes a precaution which effectually secures his principle against any possible exception, by resolving, that if any idea shall hereafter present itself, which cannot be derived from some impression, he will consider it as no idea at all. "When we entertain," he tells us, "any suspicion, that a philosophical term is employed without any meaning or idea (as it is but too frequent) we need but enquire, *from what immediate impression is that supposed idea derived?* And if it be possible to assign any, this will serve to confirm our suspicion." "Where we cannot find any impression, we may be certain that there is no idea."

Having thus established his principle, he proceeds to its illustration. The idea which he selects for this purpose, and the reality of whose existence he thus puts to the test, is that of a cause. "We mus enquire," says he, "how we arrive at the knowledge of cause and effect?" And this, he assures us, perfectly accords with his principle; it "arises from experience," that is to say, it is copied from our *immediate impressions*.

He does indeed acknowledge, that "the particular powers," *or causes*, "by which all natural operations are performed, never appear to the senses;" that is, *never make any immediate impression*, and that "he has not by all his *experience* acquired any idea or knowledge of the secret power by which one object produces the other." And upon this he remarks, agreeably to his principle, that "as we can have no idea of any thing which never appeared to our outward sense or inward sentiment, the necessary conclusion seems to be, that we have no idea of connection or power at all, and that these words are absolutely without any {534} meaning, when employed either in philosophical reasonings, or common life."

The question here seems to be, whether we shall relinquish the principle, or discard this stubborn idea that will not submit to it? Some men, I have no doubt, would willingly give up every idea in their heads, rather than incommode their favorite system; but Mr. Hume would not do this rashly. "There still remains," says he, "one method of avoiding this conclusion." Well, the, let us see how this unfortunate idea will escape.

It is not, he owns, reasonable to conclude, merely "because one event, in one instance, precedes another, that, therefore, the one is the cause, the other the effect;" because, "we can never observe the tie between them." For instance, when I strike this table, the blow is followed by a sound, and all that I perceive are the motion and the sound; but I do not see what it is that connects these events, nor if this were the first time I had observed them, should I have any idea of a necessary connection between them?

But "when many uniform instances appear, and the same object is always followed by the same

event, we then begin to entertain the notion of cause and connection." That is to say, after observing two events constantly succeeding one the other, we conclude that they must always occur for the future in the same order, and that whenever the first takes place, the other must of necessity follow it. Mr. Hume says, it is not "by any process of reasoning" that we draw this conclusion. How then? By "custom or habit; for," he argues, "whenever the repetition of any particular act or operation, produces a propensity to renew the same act or operation, without being impelled by any reasoning or process of the understanding; we always say, that this propensity is the effect of custom." "When we say, therefore, that one object is connected with another, we mean only, that they have acquired a connection in our thought."

Accordingly, one of his definitions of a cause is, "an object followed by another, and whose appearance always conveys the thought to that other." Let us try this by an instance: -- Suppose a philosopher, who, with an excellent stomach, had all his life been used to live well, so that at a certain hour, when he began to feel himself hungry, he was regularly served with a good dinner then imagine that a set of lean half-famished philosophers, of some other sect, merely for the sake of an experiment, should eat up his dinner for him. Well, at the usual time his appetite returns. That event, which had always been succeeded by another so very agreeable, immediately conveys his thoughts to that other; because, forsooth, the appetite and the dinner have acquired a connection in his thought, and he feels a strong propensity to renew a particular act or operation. Here are all the symptoms of causation; but no dinner! How the philosopher would be surprised. In a little time, however, he would see that Hume was mistaken. He would find that the customary connection of two events might cause an association of his ideas, so that, when one of the events occurred it would convey his thought to the other; but this would no more make him expect that other, than he would expect a dinner because his appetite put him in mind of it. He would learn not to consider one event as the effect of another, merely because the ideas were associated in his mind; he would look not only for a customary, but a necessary connection between them: but it is clear that custom or habit can only associate our ideas, and give us the notion of a customary connection. The question is, how do we get the idea of a necessary connection? Says Mr. Hume, "When the same object is always followed by the same event, we then begin to entertain the notion of cause and connection." This is a fact which no one disputes; the only question is, *why* do we then begin to entertain such a notion? Upon the bare experience, that a certain event has hitherto been succeeded by another, why do we with such assurance conclude, that it must always be succeeded by it? Mr. Hume tells us, it is because "We then feel a new sentiment or impression, to wit, a customary connection in the thought or imagination, between one object and its usual attendant; and this sentiment," he informs us, "is the original of that idea which we seek for." If the idea in question, which is that necessary connection, be copied from the idea of customary connection, the idea of black may be copied from that of white. Let the customary connection have lasted as long, and the habit of observing it have grown as obstinate as you please, it can never change its nature; it is still but a customary connection, and {535} how it should raise in the mind a totally new idea, seems perfectly inconceivable. The gap is still unclosed, and the space between the *has been* and the *must be*, is as wide as ever. But it may be insisted, that the habit of constantly observing a connection, acts so upon the mind, as to make us afterwards positively expect it, and believe it absolutely necessary. If this assertion were sufficient, nothing could be more easy or more common; but the cause here assigned is notoriously inadequate to the effect. What is there in the circumstance, of my having hitherto always seen two events connected, that seems at all calculated to raise in me a belief, that they could not possibly have occurred separately, and that they must

always for the future be so joined? That, upon experiencing a customary connection, or rather a constant order of succession, we do conceive the idea of a necessary connection, is allowed; but what proof have we that this experience is the cause of the idea? If we examine the nature of the experience, we find nothing in it that bears the least reference to such an idea; so that the argument stands thus: habit certainly produces the idea of necessity, because it is succeeded by that idea in the mind. In fact, it is an assertion unsupported by argument. What is the usual effect of habit? Mr. Hume tells us, it is "a propensity to renew a particular act or operation," in other words, it is a desire of obtaining something to which we are accustomed. But can my desire of a thing persuade me that I must necessarily obtain it, and that the whole order of nature would be destroyed if I should not? Doubtless it will be insisted, that the strong desire or propensity, derived from habit, to renew the connection between two events, does absolutely raised in us a belief, that there is a necessary connection between them, and that this desire of renewing it, compels us to think that it will be renewed. Yet this assertion is still more destitute of proof than the last. How has it been proved that we have any desire that the effect should follow the cause? Ask the thief at the gallows whether he desires that the rope should strangle him. It may be said, perhaps, that desire is the constant effect of habit, and may therefore be supposed; but never, surely, did the greatest dunce contract a liking to the birch, though in the habit of being flogged daily. The repetition of even of what was once agreeable, frequently becomes tiresome, and what is so eagerly pursued as variety? But that the mind takes no pleasure in the constant union of the effect with its cause (merely as such) seems evident from the greediness with which men swallow the monstrous stories of enchantment, ghosts, miracles, &c. where all that so much delights us is, the disorderly production of some effect by an unusual cause. Yet I will even suppose it proved, that we have some occult desire or propensity to renew the connection between events; still the chief point is to be considered. It has not yet been shown, that the mere desire of a thing is in any way calculated to produce a belief of its necessity, nor does it appear that such a desire could even form the idea of necessity in the mind; at least, I can see no reason to conclude that it does, and Mr. Hume does not supply me with any; on the contrary, he confounds the two things together, and then accounts for them as if they were one and the same. In order to prove that the habit of observing a connection gives us the idea of its necessity, he tells us, that it creates a propensity to renew it; as if the propensity to, or desire of a thing were not to be distinguished form the conception of its necessity. These are certainly two very different ideas, nor do I see that one in the least refers to the other. Whether we are told, therefore, that habit produces the idea of necessity, or, that habit only raises a propensity, and that this propensity causes the idea; what is all this but assertion and conjecture, unsupported by reason?

Indeed, Mr. Hume himself, as if internally conscious that he had not traced the idea to its source, drops the term *habit* and has recourse to that of *instinct*.

Speaking of "this operation of the mind, by which we infer the effects from like causes;" he tells us, "it is more conformable to the ordinary wisdom of nature to secure so necessary an act of the mind by some instinct or mechanical tendency, which may be infallible in its operations, may discover itself at the first appearance of life and thought, and may be independent of all the laboured deductions of the understanding."

I understand by instinct, a power depending upon the peculiar structure of the mind, and which determines it to some particular act. If it be by instinct, therefore, that we infer one event from another, that is, if the peculiar structure of the mind makes us conceive a necessary {536} connection between two events or impressions; that instinct is the origin of the idea of necessary

connection, and not the mere impressions or events which were only connected by it in our thought. "Nature," he continues, "has implanted in us an instinct which carries forward the thought in a correspondent course to that which she has established among external objects." But this is not enough. An instinct which shall make me conclude one event to be the cause of another, must not only carry my thought from one to the other; it must not only associate the two ideas, and remind me of their customary connection; it must actually produce in my mind the idea of a necessary connection between them; for till it does this, it cannot make me conclude that one is the cause of the other. If the instinct do not give me the idea of a necessary connection between events, it cannot make me infer like effects from like causes; and, therefore, such an instinct would not answer the purpose; and if we get the idea from any other quarter, for instance, from observing the "course established among external objects," the instinct is altogether superfluous, for in that case, all we want is memory.

But it has been proved, that we did not acquire this idea by observing the course of events, as in all that course there is nothing like the idea to be observed. Therefore, whether we have an instinct, and the idea originate in it, or whatever may be the origin of this idea, it does no appear that it could either arise from the connection of events in a single instance; or from the customary connection in a number of instances; or from the habitual association of ideas, arising from the customary connection; or even from any desire we may be supposed to have for the renewal of the connection. We cannot, therefore, attribute it to the impressions of sense, either immediately or mediately; so that it stands in direct opposition to the principle of Mr. Hume.

It remains now to be decided, whether we shall discard an idea which seems essential to human reason, or give up the universality of this principle? Those who resolve to abide by the principle, let what will become of the idea, should at least be as candid as Mr. Hume has been, and first, carefully examine whether there be not some impression from which it might be derived; after that, they may, if they please, deny its existence, as a dogmatical shoemaker might swear you have no feet, because his shoes will not fit them.

But it may be said, according to Mr. Hume's system, an idea is in fact no idea, unless it be derived from some impression; nor till he has discovered that impression, does he speak of it positively as such, he calls it only a *supposed idea*. What an excess of refinement is this! We hear every day of the supposed advantages of a ruinous war, that is to say, advantages that exist only in idea; but here is an *idea* which exists *only in idea*. I wonder how some philosophers would have an idea exist. If we ask Berkeley in what way ideas exist, he tells us plainly (sec. 139) that *they exist merely by way of idea*, and I confess I am of his opinion.

I shall not, however, attempt to prove the existence of this idea as to those who have not the idea, it would be impossible, and to those who have, superfluous. Yet it may not be amiss to apprize those who deny its existence, of the dilemma to which they are reduced. Either they must acknowledge they have the idea, whose existence they deny; or confess they have no idea of what they deny.

It may be asked, of what use is this inquiry in the origin of ideas? Shall we not continue to act upon the belief of a necessary connection between events, and will not the effect as regularly follow its cause, whether we know the origin of this idea or not? Certainly. And what is more, we shall probably continue to dispute about the existence of a FIRST CAUSE, and argue as learnedly as ever, both for and against the doctrine of NECESSITY, whether we are able to tell *how such an idea ever came into our heads* or not. This is undoubtedly true, and yet there is one reason why I wish we were able to account, not only for this, but for a thousand other phenomena in the mind;

and that is, that we might have some plea for rejecting, without examination, the system of Professor Kant; for it would be an excellent excuse for treating the philosophy of other nations with contempt, if we could but produce a reasonable and consistent theory of our own.

H. RICHTER

The Scottish Philosophy

James McCosh
1875

XIX.-- DAVID HUME.[33]

DAVID HUME was born at Edinburgh, on April 26, 1711. He was the second son of Joseph Home or Hume, of Ninewells, so called from a number of springs which may still be seen as fresh as when the name was given. The mansion is in the parish of Chirnside, in Berwickshire, and is situated on the green slope of a hill which rises from the river Whitadder, immediately in front. The situation is remarkably pleasant, and from the heights above there are extensive views of the whole eastern border country, now associated in the minds of all reading people with tales of romance. Here David Hume passed the greater portion of his younger years, and much of the quieter and more studious parts of his middle age. But he never refers to the scenes of his native place, not even (as Mr. Burton has remarked) when be has occasion in his History of England" to relate events which might have led him to do so. It is clear that his taste for the beauties of nature was never very keen; the time had not come when all people rave about natural scenery; he was in no way disposed to expose himself to English prejudice by betraying Scottish predilections, and I rather think that he was glad that the time of border raids had for ever passed away.

His father was a member of the Faculty of Advocates, but passed his life as a country gentleman. His mother was a daughter of Sir D. Falconer of Newton, who had been a lawyer in the times of the Stuarts, and had filled the office of president of the Court of Session from 1682 to 1685. So far as the youth was exposed to hereditary predilections, they were those of Scotch landlords, who ruled supreme in their own estates, of hard-headed Edinburgh lawyers, and of old families {114} opposed to the great Whig or covenanting struggle of the previous century. His father having died when the second son was yet an infant, the education of the children devolved on their mother, who is represented as training them with great care,-in what way or form in respect of religion we are not told.

David became an entrant of the class of William Scott, professor of Greek in the Edinburgh University, February 27, 1723, being still under twelve years of age. What his precise college course was is not recorded; but we know generally that in those times, and for many years after, boys who should have been at school, after getting an imperfect acquaintance with Latin and Greek, were introduced in the classes of logic, pneumatics, and moral philosophy, to subjects fitted only for men of mature powers and enlarged knowledge. I suspect there was no ruling mind among his teachers to sway him, and he was left to follow the bent of his own mind. Already he has a taste for literature, and a tendency to speculative philosophy. " I was seized very early," be says in " My Own Life," with a passion for literature, which has been the ruling passion of my life, and a great

source of my enjoyments." In writing to a friend, July 4, 1727, he mentions having by him written papers which he will not make known till he has polished them, and these evidently contain the germs of a system of mental philosophy. " All the progress I have made is but drawing the outlines on loose bits of paper: here a hint of a passion; there a phenomenon in the mind accounted for; in another an alteration of these accounts." Mr. Burton publishes part of a paper of his early years, being " An Historical Essay on Chivalry and Modern Honor." In it we have no appreciation of chivalry, but we have the germs of the historical, political, and ethical speculations which he afterwards developed. He inquires why courage is the principal virtue of barbarous nations, and why chastity is the point of honor with women (always a favorite topic with him), and is evidently in the direction of his utilitarian theory of virtue. About his seventeenth year he began, but speedily relinquished, the study of the law. " My studious disposition, my sobriety, and my industry, gave my family a notion that the law was a proper profession for me; but I found an unsurmountable aversion {115} to every thing but the pursuits of philosophy and general learning; and while they fancied I was poring upon Voet and Vinnius, Cicero and Virgil were the authors I was secretly devouring."

We have two admirable accounts of Hume's life: the one, " My Own Life," calm as philosophy itself; the other by Mr. Hill Burton, who had access to the papers collected by Baron Hume, and deposited with the Royal Society of Edinburgh; and who has collected all other available information, and put it together in a clear and systematic manner. But there is much that we should like to know not communicated. The autobiography, though honest enough, is not open or communicative. We may rest assured that in that great lake which spreads itself so calmly before us, there were depths, and movements in these depths, which have been kept from our view. Though so skilled in psychological analysis, he gives no account of the steps by which he was led to that deadly scepticism in philosophy and theology which be held by so firmly, and propounded so perseveringly. Mr. Burton has, however, published a remarkable document, which lets us see what we should never have learned from " My Own Life," that there had been an awful struggle and a crisis.

It is a letter written to a physician with great care, but possibly never sent. He begins with stating that he " had always a strong inclination to books and letters," and that, after fifteen years, he had been left to his own choice in reading: " I found it to incline almost equally to books of reasoning and philosophy, and to poetry and the polite authors. Every one who is acquainted either with the philosophers or critics, knows that there is nothing yet established in either of these sciences, and that they contain little more than endless disputes, even in the most fundamental articles. Upon examination of these, I found a certain boldness of temper growing in me, which was not inclined to submit to any authority on these subjects, but led me to seek out some new medium by which truth might be established. After much study and reflection on this, at last, when I was about eighteen years of age, there seemed to be opened up to me a new source of thought, which transported me beyond measure, and made me, with an ardor natural to young men, throw up every other pleasure or {116} business to apply actively to it. The law, which was the business I designed to follow, appeared nauseous to me; and I could think of no other way of pushing my fortune in the world but that of scholar and philosopher. I was infinitely happy in this course of life for some months, till at last, about the be ginning of September, 1729, all my ardor seemed in a moment to be extinguished, and I could no longer raise my mind to that pitch which formerly gave me such excessive pleasure. I felt no uneasiness or want of spirits when I laid aside my book; and therefore never imagined there was any bodily distemper in the case, but that my coldness

proceeded from a laziness of temper which must be overcome by redoubling my application. In this condition I remained for nine months, very uneasy to myself, but without growing any worse, which was a miracle. There was another particular which contributed more than any thing to waste my spirits, and bring on me this distemper, which was, that, having read many books of morality,-- such as Cicero, Seneca, and Plutarch, - and being smit with their beautiful representations of virtue and philosophy, I undertook the improvement of my temper and will, along with my reason and understanding. I was continually fortifying myself with reflections against death and poverty and shame and pain, and all the other calamities of life. These no doubt are exceeding useful when joined with an active life, because the occasion being presented, along with the reflection, works it into the soul, and makes it take a deep impression; but in solitude they serve to little other purpose than to waste the spirits, the force of the mind meeting with no resistance, but wasting itself in the air, like our arm when it misses the aim. This, however, I did not learn but by experience, and till I had already ruined my health, though I was not sensible of it." He then describes the symptoms: scurvy spots breaking out on his fingers the first winter, then a wateriness in the mouth. Next year, about May, 173 1, there grew upon him a ravenous appetite, and a palpitation of heart. In six weeks, from " being tall, lean, and rawboned, he became on a sudden the most sturdy robust, healthful-like fellow you have seen, with a ruddy complexion and a cheerful countenance." He goes on to say, that " having now time and leisure to cool my inflamed imagination, I began to consider seriously how I should proceed with my philosophical {117} studies. I found that the moral philosophy transmitted to us by antiquity labored under the same inconvenience that has been found in their natural philosophy, of being entirely hypothetical, and depending more upon invention than experience every one consulted his fancy in erecting schemes of virtue and happiness, without regarding human nature, upon which every moral conclusion must depend. This, therefore, I resolved to male my principal study, and the source from which I would derive every truth in criticism as well as morality." He tells how he had read most of the celebrated books in Latin, French, and English; how "within these three years I find I have scribbled many a quire of paper, in which there is nothing contained but my own inventions;" how he " had collected the rude materials for many volumes but he adds, " I had no hopes of delivering my opinions with such elegance and neatness as to draw to me the attention of the world, and I would rather live and die in obscurity than produce them maimed and imperfect." "It. is a weakness rather than lowness of spirits which troubles me;" and he traces an analogy between what he had passed through and recorded religious experiences. " I have noticed in the writings of the French mystics, and in those of our fanatics here, that when they give a history of the situation of their souls, they mention a coldness and desertion of the spirit, which frequently returns." But, " however this may be, I have not come out of the cloud so well as they commonly tell us they have done, or rather began to despair of ever recovering. To keep myself from being melancholy on so dismal a prospect, my only security was in peevish reflections on the vanity of the world, and of all human glory, which, however just sentiments they may be esteemed, I have found can never be sincere, except in those who are possessed of them. Being sensible that all my philosophy would never make me contented in my present situation, I began to rouse up myself." He found these two things very bad for this distemper, study and idleness, and so he wishes to betake himself to active life. His choice was confined to two kinds of life, that of a travelling governor, and that of a merchant. The first not being fit for him he says he is now on his way to Bristol, to engage in business till he is able to "leave this distemper behind me." He says, that " all the physicians {118} I have consulted, though very able, could never enter into my distemper," and so he now applies to this eminent doctor.

In this remarkable document Hume unbosoms himself for the first time, and, I may add, for the last time. He had endeavored to act the self-righteous and self-sufficient stoic. We have other evidence of this. In the letter already extracted from, written when he was sixteen, he says. "I hate task-reading, and I diversify them at pleasure; sometimes a philosopher, sometimes a poet." "The philosopher's wise man and the poet's husbandman agree in peace of mind in a liberty and independence on fortune, and contempt of riches, power, and glory. Every thing is placid and quiet in both, nothing perturbed or in disorder." " A perfectly wise man that outbraves fortune is surely greater than the husbandman who slips by her; and indeed this pastoral and Saturnian happiness I have in a great measure come at just now. I live a king, pretty much by myself, neither full of action nor perturbation, -- ***molles somnos*****. This state, however, I can foresee, is not to be relied on. My peace of mind is not sufficiently confirmed by philosophy to withstand the blows of fortune. This greatness and elevation of soul is to be found only in study and contemplation; this can alone teach us to look down on human accidents. You must allow me to talk thus like a philosopher; 'tis a subject I think much on, and could talk all day long of." But the attempt had turned out a miserable failure, as he acknowledges in his letter to the physician. Doubts had crept in, and the stoic was tempted to turn sceptic. Writing long after to Sir Gilbert Elliott in regard to his " Dialogues on Natural Religion," which sap all religion, be mentions a manuscript, afterwards destroyed, which he had written before twenty. "It began with an anxious search after arguments to confirm the common opinion, doubts stole in, dissipated, returned, were again dissipated, returned again; and it was a perpetual struggle of a restless imagination against inclination, perhaps against reason."**

The letter is supposed by Mr. Burton, on good grounds, to have been written to the celebrated Dr. Cheyne, author of the Philosophical Principles of Natural Religion" (1705), and The English Malady; or a Treatise of Nervous Diseases of all kinds, Spleens, Vapours, Lowness of Spirits, Hypochondriacal {119} Distempers," &c. It is doubtful whether the letter ever reached Dr. Cheyne, and it may be doubted whether that eminent physician had in all his pharmacopoea a medicine to cure the malady of this remarkable youth. Dr. Cheyne defends with the common arguments the "great fundamental principles of all virtue and all morality: viz., the existence of a supreme and infinitely perfect Being; the freedom of the will, the immortality of the spirits of all intellectual beings, and the certainty of future rewards or punishments." But the youth who proposed to address him had already a system evolved which undermined all these. One could have wished that there had been a friend at hand to direct him away from Cicero, Seneca, and Plutarch, to a better teacher who is never mentioned. Not that we should have expected him in his then state to be drawn to the character of Jesus, but he might have found something in His work fitted to give peace and satisfaction to his distracted soul. But it is useless to speculate on these possibilities. All he says himself is: " In 1734 I went to Bristol with some recommendations to eminent merchants, but in a few months found that scene totally unsuitable to me. I went over to France, with a view of prosecuting my studies in a country retreat, and I there laid that plan of life which I have steadily and successfully pursued."[34]

We can easily picture the youth of twenty-three as he set out for France. By nature he is one of a class of persons to be found in all countries, but quite as frequently in Scotland as anywhere else, who are endowed with a powerful intellect, conjoined with a heavy animal temperament, and who, with no high aspirations, ideal, ethereal, or spiritual, have a tendency {120} to look with suspicion on all kinds of enthusiasm and highflown zeal. With an understanding keen and searching, he could not be contented with the appearances of things, and was ever bent on penetrating beneath

the surface; and his native shrewdness, his hereditary predilections, and the reaction against the heats of the previous century, all combined to lead him to question common impressions and popular opinions. He saw the difficulties which beset philosophical and theological investigations, and was unable to deliver himself from them, being without the high sentiments which might have lifted him above the low philosophy of his own day in England and France, and the sophistries suggested by a restless intellect. He knew only the ancient Stoic philosophy in the pages of Roman authors, and the modern philosophy of Locke, as modified by such men as Shaftesbury and Hutcheson, and driven to its logical consequences by Berkeley: he bad tried the one in his practical conduct, and the other by his sifting intellect, and having found both wanting, he is prepared to abandon himself to scepticism, which is the miserable desert resorted to by those who despair of truth. Meanwhile his great intellectual powers find employment in constructing theories of the mind, in which he himself perhaps had no great faith, but which seemed the logical conclusion of the acknowledged philosophical principles of his time, and quite as plausible as any that had been devised by others, and brought such fame to their authors.

With these predilections, France was the country which had most attractions to him, but was at the same time the most unfortunate country he could have gone to, and the middle of the eighteenth century the most unfortunate period for visiting it. In philosophy, the age had outgrown Descartes and Malebranche, Arnauld and Pascal, and the grave and earnest thinkers of the previous century, and was embracing the most superficial parts of Locke's philosophy, which had been introduced by Voltaire to the knowledge of Frenchmen, who turned it to a wretched sensationalism. In religion he saw around him, among the great mass of the people, a very corrupted and degenerate form of Christianity, while, among the educated classes, infidelity was privately cherished, and was ready to burst out. Voltaire had issued his first attack on Christianity, {121} in his " Epitre a Uranie," published in 1728, and the fire spread with a rapidity which showed that there were materials ready to catch it and propagate it. Sixty years later, one so fond of order and peace would have been scared by the effects produced by scepticism, so powerful in overthrowing old abuses, and so weak in constructing any thing new or better but at this time infidelity was full of hope, and promising an era of liberty and peace. The very section of the Catholic Church which retained the highest faith and the purest morality, had unfortunately been involved in a transaction which favored the sceptical tendency among shrewd minds. Only a few years before, the people believed that the sick were healed, and the blind made to see at the tomb of the famous Jansenist, the Abbe Paris; the noise made by the occurrences, and the discussions created by them, had not passed away when Hume arrived in Paris; and the youth pondered the event, to bring it out years after in his " Essay on Miracles." While he lived at La Fleche, a Jesuit plied him with some "nonsensical miracle," performed lately in their convent, and then and there occurred to him the famous argument which he afterwards published against miracles. " As my head was full of the topics of the `Treatise of Human Nature,' which I was at that time composing, the argument immediately occurred to me, and I thought it very much gravelled my companion; but at last he observed to me that it was impossible for that argument to have any validity, because it operated equally against the gospel as the Catholic miracles, which observation I thought fit to admit as a sufficient answer."

After living a short time in Paris, he retired to Rheims, and afterwards went to La Fleche, where he passed two of the three years he spent in France. We know nothing of his employments these years, except that he devoted himself most earnestly to the composition of his " Treatise on Human Nature." In 1737 he brought it over with him to London, where he published the two first books

the end of the following year.

This treatise is by far the most important of all. his philosophical works. If we except certain speculations in history and political economy, it contains nearly all his favorite ideas. He devoted to it all the resources of his mighty intellect. He {122} had read extensively, pondered deeply, and taken immense pains in polishing his style. He could scarcely, indeed, be called a learned man, in the technical sense of the term, but he was well informed. We could have wished that he had possessed wider sympathies with earnest seekers after truth in all ages, but this was not in the nature of the man. His knowledge of Greek was very imperfect at this time (he afterwards renewed his acquaintance with that language); what he knew of Greek philosophy was chiefly through Cicero (his very pictures of the Stoics and Epicureans are Roman rather than Grecian), and he never entered into the spirit of such deep and earnest thinkers as Socrates, Plato, and Aristotle, -- he tells us somewhere that the fame of Aristotle is utterly decayed. In respect even of modern writers, he never comprehended the profundity of such men as Cudworth and Descartes in the previous century; and he had no appreciation of the speculations of Clarke and Leibnitz, who lived in the age immediately preceding his own. He belongs to the cold, elegant, doubting, and secular eighteenth century; and, setting little value on antiquity, he builds for the present and the future on the philosophy of his own time.

As to style, which he greatly cultivated, the models which he set before him were the Roman prose writers, the French authors of his own day, and the Englishmen who were introducing the French clearness and point, such as Shaftesbury, Bolingbroke, and Pope, -- he says: " The first polite prose we have was written by Swift." Though he took great pains, he never altogether succeeded in weeding out his Scotticisms, nor in acquiring a genuine English idiom; but his style is always clear, manly, and elegant, and worthy of his weighty thoughts. When he broke down his elaborate treatise into smaller ones, he endeavored to catch the ease and freedom of the lighter French literature; but neither the subjects discussed nor the ideas of the author admit of such treatment; and though the essays are more ornate, and have more attempts at smartness and repartee, the student will ever betake himself to the treatise, as containing the only systematic, and by far the most satisfactory statement of his views.

He is now publicly committed to a theory, and he adheres to it resolutely and doggedly. In after years he said: " So {123} great an undertaking, planned before I was one-and-twenty, and composed before twenty-five, must necessarily be very defective. I have repented my haste a hundred and a hundred times." But this refers to the form and style, not the matter. He never abandoned nor modified the scepticism advanced in the early work. When he failed in obtaining a hearing for his views in the more elaborate treatise, he set them forth in " Essays," which might be more attractive to the general reader. He had instituted an inquiry, and satisfied himself that speculative truth was unattainable, either in philosophy or theology , owing to the weakness of the human intellect, and he did not wish to be disturbed with questionings. He seems to have studiously abstained from speaking on such subjects in social intercourse, except at times, in a tone of playful humor, not meant to be offensive; and on becoming an author he formed the resolution " never to reply to anybody." He rather delighted to associate with ministers of religion, such as Robertson, Blair, and Carlyle, whom he reckoned moderate and tolerant, and helpful in producing a religious indifference; but he never allowed them to try to convert him to the truths of natural and revealed religion which they held by; and when Dr. Blair ventured on one occasion to make the attempt, he received such a reply as prevented the repetition of it on any future occasion. There are traditions of him and Adam Smith conversing familiarly on such subjects on the sands of Kirkcaldy, and of

Hume succeeding in bringing his friend over to infidelity; but we have no authenticated record of Hume ever opening to any human being the religious or irreligious convictions of his soul. A good-natured and sociable man, kind and indulgent to those with whom he came in contact, he passed through life a solitary being, certainly with no God, and apparently with no human being to whom to unbosom himself.

Having set the matured and confirmed man before our readers, we have no intention of detailing minutely the events of his future life. Having published his work, he retired to Ninewells to wait the result. "Never literary attempt was more unfortunate than my `Treatise of Human Nature.' It fell deadborn from the press without reaching such distinction as even to create a murmur among the zealots." He evidently felt the {124} disappointment. "I am out of humor with myself." He was amazed that the liberty he had taken with all established truth had not created a sensation. But he was conscious of intellectual power: he had laid his plan for life; and he indomitably persevered in his literary career. Next year he published the third volume of his treatise, that on ethics, with no better success. In 1741 he printed at Edinburgh the first, and in 1742 the second, of his " Essays Moral and Political." The work was favorably received and he was encouraged. In 1744 he was anxious to be appointed Professor of Moral Philosophy in the University of Edinburgh, but public sentiment could not bear the idea of one so sceptical being appointed a teacher of youth. He was a younger brother without a profession, and he wished to have a competency; and so in 1745, the year of the rebellion of Prince Charles, he became the companion and guide of the weak-minded Marquis of Annandale. The engagement brought him some accession of fortune, but terminated abruptly from the caprice of the Marquis. In 1747 he attended General St. Clair in his military embassy to the Courts of Vienna and Turin. There he saw a variety of life; and he congratulates himself that when the engagement closed, he was " master of near a thousand pounds." In 1748 he cast the first part of his unfortunate treatise in a new form, in the "Inquiry concerning Human Understanding," but the work failed to excite any interest. His brother at Ninewells having married in 1751, his place of residence was now Edinburgh, where he was appointed to, and held for five years, the office of librarian to the advocates' library, a situation which brought him little or no emolument. In 1752 he published in Edinburgh the second part of his essays, being his " Political Discourses." This work was immediately received with acclamation; and, being translated into French, it procured him a high reputation, and in fact awakened those discussions which issued in making political economy a science in the " Wealth of Nations." Whatever merit Hume may have in demolishing error, he has, I believe, established very little positive truth: what he effected in this way was done in political economy. The same year he published his " Inquiry concerning the Principles of Morals," being an improved version of the third part of his treatise. " Meanwhile my bookseller, A. Millar, informed me that my {125} former publications (all but the unfortunate treatise) were beginning to be the subject of conversation, that the sale of them was gradually increasing, and that new editions were demanded. Answers by reverends and right reverends came out two or three in a year; and I found, by Dr. Warburton's railing, that the books were beginning to be esteemed in good company." He had long had the idea of writing some historical work, and from the time of his being appointed librarian to the well-stored advocates' collection of books, he formed the plan of writing the " History of England." The first volume commenced with the accession of the house of Stuart, but was received so coldly that in a twelvemonth the publisher sold only forty-five copies. Nevertheless he persevered, bringing out volume after volume, till at last the great merits of the work were acknowledged. This perseverance in his life plan, in spite of discouragements, I reckon as the noblest feature in Hume's

character. It does not concern us here to speak of the excellencies and defects of the history. It could be shown that the prejudices running throughout it were his constitutional and hereditary ones, and that the work, as a whole, is an illustration of his metaphysical and ethical theory.

In 1763 he received from the Earl of Hertford an invitation to attend him on his embassy to Paris. His visit to the capital of France on this occasion deserves a special notice. It may be doubted whether there ever were such compliments paid to any literary man. Dukes, mareschals, foreign ambassadors, vied with each other in honoring him. The famous men, whose persons and conversations he liked best, were D'Alembert, Marmontel, Diderot, Duclos, Helvetius, and old President Henault; and he writes to Dr. Blair, and bids him tell Dr. Robertson that there was not a single deist among them, meaning that there was none of them but went farther. He met also with Buffon, Malesherbes, Crebillon, Holbach, Renauld, Suard, and Turgot.

But he was the special favorite of the ladies, who at that time ruled the fashion in Paris. In particular, he was flattered and adored by the Countess de Boufflers. His correspondence with that lady had commenced in 1761. She addressed him first, declaring the admiration which, your sublime work (the `History of England') has awakened in me." "I know no terms {126} capable of expressing what I felt in reading the work. I was moved, transported; and the emotion which it caused me, is in some measure painful by its continuance. It elevates the soul it fills the heart with sentiments of humanity and benevolence it enlightens the intellect, by showing that true happiness is closely connected with virtue; and discovers, by the same light, what is the end, the sole end, of every reasonable being"! In truth, I believed I had before my eyes the work of some celestial being, free from the passions of humanity, who, for the benefit of the human race, has designed to write the events of these latter times"! The philosopher is evidently gratified. " What new wonder is this which your letter presents to me? I not only find a lady, who, in the bloom of beauty and height of reputation, can withdraw herself from the pleasures of a gay court, and find leisure to cultivate the sciences, but deigns to support a correspondence with a man of letters, in a remote country, and to reward his labors by a suffrage the most agree able of all others to a man who has any spark of generous sentiment or taste for true glory." This lady, it is proper to say in plain terms, was the wife of the Comte de Boufflers, still alive, but the mistress of the Prince of Conti, who superintended for the king that mean diplomatic correspondence which he carried on unknown to his ministers. Hume might also be seen attending the evening *salons* of Madame Geoffrin, who had been the daughter of a *valet de chambre*, and was now the centre of a circle of artists and men of letters. He also waited on the entertainments of the famous Mademoiselle de l'Espinasse, who, originally an illegitimate child, had raised herself by being, first, the humble companion, and then the rival of Madame Du Deffaud, and was well known to have been the mistress of a number of successive or contemporaneous lovers. There must have been something in the philosophy of Hume which recommended him to so many ladies of this description. We believe they were glad to find so eminent a philosopher, with a system which did not seem to bear bard upon them. The courtiers told him that Madame de Pompadour " was never heard to say so much to any man."

He says of himself: " I eat nothing but ambrosia, drink nothing but nectar, breathe nothing but incense, and tread on nothing but flowers. Every man I meet, and still more every lady, {127} would think they were wanting in the most indispensable duty if they did not make a long and elaborate harangue in my praise." Lord Charlemont has given us a picture, or rather a caricature, of his person as he met him at Turin some years before this. " His face was broad and flat, his mouth wide, and without any other expression than that of imbecility. His eyes vacant and spiritless, and the corpulence of his whole person was far better fitted to communicate the idea of a

turtle-eating alderman than of a refined philosopher. His speech in English was tendered ridiculous by the broadest Scotch accent, and his French was, if possible, still more laughable." This was the man who was made by the Parisian ladies to take the part, in an acted tableau, of a sultan assailed by two female slaves: " On le place sur un sopha entre les deux plus jolies femmes de Paris, il les regarde attentivement, il se frappe le ventre et les genoux A plusieurs reprises, et ne trouve jamais autre chose a leur dire que, -- `Eh bien! mes demoiselles. . . . Eh bien! nous voila donc. . . . Eh bien ! vous voila. . . . vous voila ici.'" His good sense led him to see the vanity of all this: but he was pleased with it; and he often expresses a wish to settle in Paris, or somewhere in France.

When he was introduced to the Dauphin, his son, afterwards the unfortunate Louis XVI., but then a boy of nine, stepped forth, evidently by instruction, and told him how many friends and admirers he had in the country, and that he reckoned himself among the number from the reading of many passages in his works. The Comte de Provence (who, after his long exile, became Louis XVIII.),a year or so younger, now approached Hume, and told him he had been long and impatiently expected in France, and that he anticipated great pleasure from reading his fine history. Even the Comte d'Artois, afterwards Charles X., but then a boy of six, had to mumble a panegyric. A wise man learned in providence might have seen that awful miseries must issue from a state of things in which, as Horace Walpole pointedly expresses it, " There is a God and the king to be pulled down first, and men and women are devoutly employed in the demolition," while princes were taught to cherish the viper that was to sting them. It would have been an appropriate punishment to have got Hume placed, half a century later, in the scenes of the French Revolution, to let him eat the fruit of the seed he had helped to sow. {128}

But what, it may be asked, did be think of the state of society in which he had to mingle? It is evident that he was horrified at times with the proclaimed atheism of men and women. But what did he think of the morality of the circles in which he moved, more especially of the loose relationship of the marriage tie? Did his utilitarian theory of morals, of which he surely knew the bearing and tendency, allow of such a state of things? It is certain that Hume uttered no protest at the time, and he has left behind no condemnation of the morality of France, while he was fond of making sly and contemptuous allusions to the manifestations of religious zeal in his own country. The tone of morality in France could never have been amended by him, nor, we venture to say, by any utilitarian. When the husband of Madame Boufflers dies, he writes to her as a person now within reach of honor and felicity; that is, as likely to be married to the Prince de Conti. However, the prince declines, and Hume gives her wise enough counsel: gradually to diminish her connection with the prince, and at last to separate from him; and, he says: " If I could dispose of my fate, nothing would be so much my choice as to live where I might cultivate your friendship. Your taste for travelling might also afford you a plausible pretence for putting this plan in execution; a journey to Italy would loosen your connections here; and, if it were delayed, I would, with some probability, expect to have the felicity of attending you thither." One can picture the scene; the countess travelling with Hume attending her. But the prospect had not such attractions as to induce her to leave the prince. Hume continued his correspondence with her; and, on hearing of the death of the Prince of Conti, wrote her within a few days of his own death, knowing he was dying, and expresses no condemnation of her past conduct. The question arises whether this would be the moral tone allowed in a community in which the word of God is discarded, and utilitarian principles are adopted?

We do not mean to discuss the miserable quarrel between him and Rousseau. His attention was

called to the alleged ill usage of Rousseau by Madame de Boufflers, who described him as a noble and disinterested soul, " flying from intercourse with the world," and " feeling pleasure only in solitude." Hume, believing him to be persecuted, exerted himself to help him. {129} But his morbid vanity and intolerable habits (he insisted in taking his disgusting governante with him when he visited a family) rendered it impossible to befriend him. Unwilling to allow himself to think, or let others conclude, that he was indebted to any one, he repaid Hume's manly and delicate kindness with suspicion; and Hume, who began by describing him as a man whose modesty proceeded from ignorance of his own excellence," ended by declaring him to be " the blackest and most atrocious villain beyond comparison that now exists in the world." It is justice to Hume to say that he was always kind to persons of literary ability. Thus, he interested himself much in Thomas Blacklock, a blind man, of some poetical talent, when the people of Kirkcudbright declined to accept him as their minister. He also did all in his power to bring into notice the publications of Robertson, Adam Smith, and Ferguson.

By his connection with the embassy and the sale of his works, which had become great, he now attained a competency which made him feel independent. He had many temptations to settle in France, but old associations drew him back to Scotland. It was proposed by Lord Hertford to send him to Ireland as Secretary; but the Irish would not receive him, because he was a Scotchman. It was on this occasion that the Princess Amelia said that she thought the affair might be easily accommodated. "Why may not Lord Hertford give a bishopric to Mr. Hume?" In 1767-68 he was appointed by Lord Conway Under-Secretary of State, and had charge of Scottish affairs, including the patronage of churches But his residence was now mainly in Edinburgh, first in the old town, afterwards in a house which he built in the new town, in St. David Street, so called as the name had been chalked on the wall by a witty young lady as she passed. Here he was the acknowledged chief of a literary circle, embracing men of considerable eminence, such as Robertson, Blair, Lord Kames, Adam Ferguson, and Adam Smith at Kirkcaldy, who all looked up to him with respect. He rather enjoyed being an object of wonder to the multitude beyond the favored circle in which he mingled, and made many jocular remarks about the unpopularity of his opinions. Good-natured, sociable, and avoiding controversy, he suffered few annoyances {130} because of his scepticism -- certainly none that deserved to be called persecution. For we suppose it will be scarcely reckoned as such, that, on one occasion, in picking his steps from his lodging in the old town to the house he was building in the new, he fell into a swamp, and, observing some Newhaven fishwives passing, he called to them for help, but on learning that it was Hume the unbeliever who was in such a plight, they refused to aid him till he said the Lord's prayer. He carried on a pleasant correspondence with Sir Gilbert Elliott of Minto, with Mure of Caldwell, and others of a literary or philosophic taste. He lived on familiar terms with several of the moderate clergy, such as Robertson and Blair, and at times mingled in their ecclesiastical counsels. Many of the younger ministers reckoned it an honor to be admitted to his society, and he encouraged them to associate with him. These circumstances have led some to think that the leading moderate ministers of that period must have been infidels in secret, and acting hypocritically in professing Christianity; but there is no ground for such a charge: they believed sincerely in the doctrines of natural religion, and in the Word of God as inspired to teach a pure morality and the immortality of the soul. But it is equally clear, that they had no faith in the peculiar Bible doctrines of grace; and Hume was delighted to find them frowning on all religious earnestness, and advancing so rapidly on the road to deism and philosophic indifference.

By April, 1776, Hume knew that he would not recover from the disease with which he had been

afflicted for two years, being a disorder in the bowels. He bought a piece of ground in the new church-yard in the Calton Hill as a burying-place, and left money for the erection of a small monument, with the simple inscription, " David Hume." lie wrote " My Own Life," giving an account of his literary career. In his will Adam Smith had been appointed his literary executor, and two hundred pounds had been bequeathed to him for the pains he might take in correcting and publishing his " Dialogues on Natural Religion," a work written before 1751, but not yet given to the world. But he had ground for fearing that Smith might be unwilling to take the odium of editing such a work, and so he took effectual steps to guard against its suppression. He came to {131} an understanding with Smith on the subject, and in a codicil to his will, dated August 7, he left the manuscripts to Strahan the publisher, ordaining " that if my `Dialogues' from whatever cause be not published within two years and a half after my death, as also the account of my life, the property shall return to my nephew David, whose duty in publishing them, as the last request of his uncle, must be approved of by all the world." Strahan was as indisposed as Smith to undertake the responsibility of publishing so offensive a work. The truth is, Hume's Scottish friends, though they had abandoned Christianity, were most anxious to have left to them a natural religion, in which they might find a refuge and some comfort; and in the "Dialogues" Hume had undermined this last support. The " Dialogues " were published in 1779 by the author's nephew.

In April he took a journey to Bath for the benefit of his health, but with no hope of ultimate recovery. John Home, the author of " Douglas, a Tragedy," travelled with him, and has preserved a diary. He talked cheerfully of the topics of the day, and of his favorite subjects, lamenting over the state of the nation, and predicting that the national debt must be the ruin of Britain. He returned to Edinburgh about the beginning of July. Dr. Cullen reports: " He passed most part of the day in his drawing-room: admitted the visits of his friends, and with his usual spirits conversed with them upon literature, politics, or whatever was accidentally started." Colonel Edmonstoune had come to take leave of him Hume said he had been reading a few days before, Lucian's Dialogues of the Dead," and, among all the reasons for not entering readily into Charon's boat, he could not find one that fitted him, and he invented several peculiar ones to give the boatman. " I might urge, I Have a little patience, good Charon: I have been endeavoring to open the eyes of the public. If I live a few years longer, I may have the satisfaction of seeing the downfall of some of the prevailing systems of superstition.' But Charon would then lose all temper and decency: `You loitering rogue, that will not happen these many hundred years. Do you fancy I will grant you a lease for so long a term ? Get into the boat this instant, you lazy, loitering rogue.'" All this is evidently very gratifying to the colonel. Dr. Black reports that he " passes his time very well with the assistance of amusing books." {132} Dr. Cullen continues: "For a few days before his death, he became more averse to receive visits; speaking, became more and more difficult to him; and for twelve hours before his death his speech failed him altogether. His senses and judgment did not fail till the last hour of his life. He constantly discovered a strong sensibility to the attention and care of his friends, and, amidst great uneasiness and languor, never betrayed any peevishness or impatience."

This was the account left by his literary friends, and it was matter of triumph to them that he betrayed no signs of fear in his hour of weakness. Are we to allow, that, as in the early ages of the world's history, those who did not like to retain God in their knowledge continued all their lives in the most abject superstition , so in these last days, under other influences, there may be persons so bewildered that they die as they live, without any fixed religious belief? The fact, if it be a fact, is not flattering to the race; nor is the prospect encouraging. Good Christians had hoped, that ere he

left the world there might be a change of sentiment, and an acknowledgment of the existence of God, and the need of a Saviour. Many of them maintained that it was impossible for an infidel to die in peace, and it was reported among religious circles, that, though he was cheerful when his unbelieving friends visited him, he had terrible uneasiness when left alone. Some of these rumors utterly break down when we try to trace them to their original sources. The statement, however, of Mr. Robert Haldane of Airthrey, as to what he learned from his neighbor, Mr. Abercromby of Tullibody, must contain some truth. Mr. Abercromby was travelling to Haddington in a lumbering stage-coach. " The conversation during the tedious journey turned on the death-bed of the great philosopher, and as Mr. Abercromby's son-in-law, Colonel Edmonstoune of Newton, was one of Hume's intimate friends, he had heard from him much of the buoyant cheerfulness which had enlivened the sick room of the dying man. Whilst the conversation was running on in this strain, a respectable-looking female, dressed in black, who made a fourth in the coach, begged permission to offer a remark: `Gentlemen,' she said, `I attended Mr. Hume on his death-bed, but, I can assure you, I hope never again to attend the death-bed of a philosopher.' {133} They then cross-examined her as to her meaning; and she told them that, when his friends were with him, Mr. Hume was cheerful even to frivolity, but that when alone be was often overwhelmed with unutterable gloom, and had in his hours of depression declared that he had been in search of light all his life, but was now in greater darkness than ever." This is Mr. Haldane's statement, as taken from Mr. Abercromby.[35] We confess we should like to know more of this woman in black, and to have taken part in the cross-questioning. The question is left in that region of doubt where Hume himself left all religion. He died on Monday, August 26, 1776, at four o'clock in the afternoon.

Everybody knows that Hume was a sceptic. It is not so generally known that he has developed a full system of the human mind. Students of philosophy should make themselves acquainted with it. It has in fact been the stimulating cause of all later European philosophy: of that of Reid and his school of that of Kant, and the powerful thinkers influenced by him and of that of M. Cousin, and his numerous followers in France, in their attempt to combine Reid and Kant. Nor is it to be omitted that Mr. J. S. Mill, in his " Examination of Hamilton," has reproduced to a large extent the theory of Hume, but without so clearly seeing or candidly avowing the consequences. I rather think that Mr. Mill himself is scarcely aware of the extent of the resemblance between his doctrines and those of the Scottish sceptic; as he seems to have wrought out his conclusions from data supplied him by his own father, Mr. James Mill, who, however, has evidently drawn much from Hume. The circumstance that Mr. Mill's work was welcomed by such declamations by the chief literary organs in London is a proof, either that the would-be leaders of opinion are so ignorant of philosophy that they do not see the consequences; or that the writers, being chiefly young men bred at Oxford or Cambridge, are fully prepared to accept them in the reaction against the revived mediaevalism which was sought to be imposed upon them. In no history of philosophy that we are acquainted with is there a good account of the system of Hume. As few persons now read, or in fact ever did read, through his weighty {134} volumes, we are in hopes that some may feel grateful to us, if in short space we give them an expository and critical account of his philosophy, with a special facing towards the philosophy which has been introduced among us by the British section of the nescient school of Comte.

Hume begins thus his famous "Treatise of Human Nature:" "All the perceptions of the human mind resolve themselves into two distinct kinds, which I call *impressions* and *ideas*. The difference betwixt them consists in the degrees of force and liveliness with which they strike upon the mind, and make their way into our thought or consciousness. Those perceptions which enter with most

force and violence, we may name *impressions,* and under this name I comprehend all our sensations, passions, and emotions, as they make their first appearance in the soul. By *ideas,* I mean the faint images of these in thinking and reasoning; such, for instance, are all the perceptions excited by the present discourse, excepting only those which arise from the sight and touch, and excepting the immediate pleasure or uneasiness it may occasion." He tells us, that, in the use of terms, " I rather restore the word *idea* to its original sense, from which Mr. Locke had perverted it, in making it stand for all our perceptions." This theory is certainly very simple, but surely it is lamentably scanty. It will not do to place under the same bead, and call by the one name of *impressions,* two such things as the affections of the senses on the one hand, and the mental emotions of hope, fear, joy, and sorrow, on the other. Nor can we allow him to describe all our sense-perceptions by the vague name of impressions. What is meant by impressions? If the word bas any proper meaning, it must signify that there is something impressing, without which there would be no impression, and also something impressed. If Hume admits all this to be in the impression we ask him to go on with us to inquire what is in the thing impressed and in the thing that impresses, and we are at once in the region of existences, internal and external. " I never," he says, " catch myself at any time without a perception, and never can observe any thing but the perception." His very language contradicts itself. He talks of catching *himself*. What is this *self* that he catches? But he may say it is only a perception. I reply that there is more. We never observe {135} a perception alone. We always observe self as perceiving. It is true that I never can catch myself at any time without a perception; but it is quite as certain, and we have the same evidence for it, that we never observe a perception except when we observe self perceiving. Let us unfold what is in this self, and we shall find that it no way resembles an impression, like that left by a seal upon wax.[36] In regard to certain of our perceptions, those through the senses, we observe not only the self perceiving, but an object perceived.

He now explains the way in which *ideas* appear. By memory the impressions come forth in their original order and position as ideas. This is a defective account of memory, consciousness being the witness. In memory, we have not only a reproduction of a sensation, or, it may be, a mental affection, we recognize it as *having been before us in time past.* Of all this we have as clear evidence as we have of the presence of the idea.[37] In imagination the ideas are more strong and lively, and are transposed and changed. This, he says, is effected by an associating quality; and he here develops his account of the laws of association, which has been so commended. But the truth is, his views on this subject, so far from being an advance on those of Hutcheson, are rather a retrogression: they are certainly far behind those of his contemporary Turnbull. He seems to confine the operation of association to the exercise of imagination: he does not see that our very memories are regulated by the same principle; nay, he allows that the imagination can join two ideas without it. The associating qualities are said by him to be three in number: resemblance, contiguity in time or place, and cause or effect. "I do not find," he says, "that {136} any philosopher has attempted to enumerate all the principles of association." But the classification propounded by him bears so close a resemblance to that of Aristotle, that we must believe that the one given by the Stagyrite had, in the course of his reading, fallen under his notice, though he had forgotten the circumstance. The difference between the two lies in Hume giving us cause and effect, instead of contrast as proposed by the Greek philosopher. It has often been remarked that Hume's arrangement is redundant, inasmuch as cause and effect, according to him, are nothing but contiguity in time and place.

He now shows how our complex ideas are formed. Following Locke, he represents these as

consisting of substances, modes, and relations. He dismisses substance very summarily. He proceeds on the view of substance given by Locke, one of the most defective and unsatisfactory parts of his philosophy. Locke stood tip for some unknown thing, called substance, behind the qualities. Berkeley had shown that there is no evidence of the existence of such a substratum. Hume assumes that we have no idea of external substance different from the qualities, and he proceeds to show that we have no notion of the substance mind distinct from particular perceptions. " I believe none will assert that substance is either a color, or a sound, or a taste. The idea of substance must therefore be derived from an impression of reflection, if it really exist. But the impressions of reflection resolve themselves into our passions and emotions, none of which can possibly represent a substance." A substance is thus nothing else than a collection of particular qualities united by the imagination. He thus suits the idea to his preconceived theory, instead of looking at the peculiar idea, and suiting his theory to the facts. I give up the idea of an unknown substratum behind the qualities. I stand up only for what we know. In consciousness, we know self, and in sense-perception we know the external objects as *existing things exercising qualities*. In this is involved what I reckon the true idea of substance. We can as little know the qualities apart from an object exercising them, as we can an object apart from qualities. We know both in one concrete act, and we have the same evidence of the one as the other.

When he comes to modes, he examines them by the doctrine {137} of abstract or general ideas propounded by Berkeley, which he characterizes "as one of the greatest and most valuable discoveries that has been made of late years in the republic of letters." According to this very defective theory (as it appears to us), all abstract or general ideas are nothing but particular ones annexed to a certain term. Like Locke, Hume confounds abstract and general ideas, which should be carefully distinguished: the former meaning the notion of the part of an object as a part, more particularly an attribute; the other, the notion of objects possessing common attributes, the notion being such that it embraces all the objects possessing the common attributes. Abstraction and generalization are most important intellectual operations, the one bringing specially to view what is involved in the concrete knowledge (not impression) of the individual, and the other exhibiting the qualities in respect of which objects agree. Without such elaborative processes, we should never know all that is involved in our original perceptions by sense and consciousness. Nor is it to be forgotten, that when the concrete is a real object, the abstract is a real quality existing in the object; and that when the singulars are real, the universal is also real, that is, a class all the objects in which possess common qualities. Here again we find Hume overlooking one of the most essential of our mental attributes, and thus degrading human intelligence. In relation to the particular end for which he introduces his doctrine, I hold that substance and mode are known in one concrete act and that we can separate them by abstraction for more particular consideration; the one having quite as real an existence as the other, and both having their reality in the singular object known by sense and consciousness.

He goes on to a very subtle discussion as to our ideas of space and time. He says, that "it is from the disposition of visible and tangible objects we receive the idea of space, and from the succession of ideas and impressions we form the idea of time." The statement requires to be amended. It is not from the disposition of separate objects we have the idea of space, but in the very perception of material objects we know them as extended, that is, occupying space; and in the very remembrance of events we have time in the concrete, that is, events happening in time past. He is therefore wrong in the {138} sceptical conclusion which he draws, that the ideas of space and time are no distinct ideas; for they are ideas formed by a high intellectual process from things immediately known.

Taking a defective view of the nature and function of abstraction, he denies that we can form any idea of a vacuum or extension without matter. He maintains that the idea we form of any finite quality is not infinitely divisible. The dispute, he says, should not be about the nature of mathematical points, but about our ideas of them; and that, in the division of our ideas, we come to a minimum, to an indivisible idea. This whole controversy seems to me to arise from a misapprehension. Our idea of space, it is evident, is neither divisible nor indivisible and as to space, it is not divisible either finitely or infinitely for while we can divide matter, that is, have a space between, we cannot separate any portion of space from all other space: space is and must be continuous. He is evidently jealous of the alleged certainty of mathematics, which seemed to be opposed to his universal scepticism. He maintains that the objects of geometry are mere ideas in the mind. I admit that surfaces, lines, points, have no independent existence, but they have all an existence in solid bodies. By an excess of ingenuities and subtleties, he would drive us to the conclusion that space and time are mere ideas, for which we need not seek a corresponding reality; a conclusion unfortunately accepted by Kant, who thus opened the way to the empty idealism which so long reigned in the German philosophy.[38] {139}

The result reached is summed up in the statement: "As long as we confine our speculations to the *appearances* of objects to our senses, without entering into disquisitions concerning their real nature and operations, we are safe from all difficulties, and can never be embarrassed by any question; " but, " if we carry our inquiry beyond the appearances of objects to the senses, I am afraid that most of our conclusions will be full of scepticism and uncertainty." The intelligent reader will here perceive the source whence Kant derived his doctrine that the senses give us, not things, but *phenomena*, that is appearances, and that we are involved in contradiction when we suppose that they furnish more. However great the logical power of the German metaphysician, it is clear that he did not possess the shrewdness of the common-sense philosopher of Scotland, when he adopted the conclusion of the sceptic as his starting-point.

He has now to face the important subjects of existence and knowledge. Proceeding on his assumption that nothing is present to the mind but perceptions, he argues, I think logically (if the premises be allowed), that we can never advance a step beyond ourselves, and that it is " impossible for us so much as to conceive or form an idea of any thing specifically different from ideas or impressions." As knowledge had been represented by Locke as consisting in comparison (I reckon this a false and dangerous doctrine), Hume has to consider the relations which the mind of man can discover.

These he represents as being seven: those of resemblance, identity, space and time, quantity, degree, contrariety, cause and effect. This is a very good enumeration of the relations perceivable by man: it is certainly very much superior to that of many later metaphysicians, British and Continental. " These relations may be divided into two classes, into such as depend entirely on the ideas which we compare together, and such as may be changed without any change in the ideas." In the first class he places resemblance, contrariety, degree, proportion. These depend solely on our ideas. These only can be the objects of knowledge and certainty, but they can never go beyond our ideas, which can never go beyond our impressions. The other four do not depend on our ideas, and might seem to carry us beyond them; but this he shows {140} is an illusion. In identity, and time and space, we can never „go beyond what is immediately present to the senses," and thus can never discover the real existence or the relations of objects. And so "`tis only causation which produces such a connection as to give us assurance, from the existence or action of one object, that 'twas followed or preceded by any other existence or action." He devotes the whole energy of his

intellect to the task of showing that we know nothing of the nature of the relation between cause and effect; that we know their conjunction within our experience, but not their connection.

In discussing this question, and kindred ones, he finds it necessary to explain the nature of belief. " The belief of the existence of an object joins no new ideas to those which compose the idea of the object." What then is the difference between belief and incredulity? It consists solely in the liveliness of the former. " We must not be contented with saying that the vividness of the idea produces the belief, we must maintain that they are individually the same." " The belief or assent which always attends the memory and senses is nothing but the vivacity of those perceptions they represent, and this alone distinguishes them from imagination." The theory is surely palpably false here, for our imaginations, in which there is no faith, are often livelier than our memories, in which there is belief. But, by this theory, he would account for all our beliefs. He would establish it as a general maxim in the science of human nature, that when any impression becomes present to us, it not only transports the mind to such ideas as are related to it, but likewise communicates to them a share of its force and vivacity. " A present impression being vivid, conveys its vividness to all the ideas which are associated with it by such general laws as those of resemblance, contiguity, and causation." " A person that has lost a leg or an arm by amputation, endeavors, for a long time afterwards, to serve himself with them. After the death of any one, 'tis a common remark of the whole family, but especially the servants, that they can scarce believe him to be dead, but still imagine him to be in his chamber, or in any other place where they were accustomed to find him." The explanation may seem a very ingenious, but it is a very feeble one. We may {141} believe that we saw a particular person yesterday, though we have no lively impression or idea retarding him; and we do not believe in the existence of Achilles, though the reading of Homer has given us a vivid conception of him.[39]

But this theory is employed to give an explanation of our {142} belief in the relation of cause and effect. The one having always been with the other in our experience, we are led by habit, and proceeding on the principle of association, when we find the one to look for the other, and thus, too, the effect being present, that is an impression, gives its vividness to the cause as an associating idea. "The idea of cause and effect is derived from experience, which, presenting us with certain objects constantly conjoined with each other, produces such a habit of surveying them in that relation, that we cannot, with out a sensible violence, survey them in any other." This is his explanation of what is implied in efficacy, agency, power, force, energy, connection, productive quality. The essence of necessity is " the propensity which custom produces to pass from an object to the idea of its usual attendant." " When any object is presented to it, it immediately conveys to the mind a lively idea of that object which is usually found to attend it, and this determination forms the necessary connection of these objects." His definition of cause is "an object precedent and contiguous to another, and so united with it that the idea of the one determines the mind to form the idea of the other, and the impression of the one to form a more lively idea of the other."

Hume's doctrine is founded on his favorite principle, " that all our ideas are copied from our impressions but the necessary connection of cause and effect cannot be in the impression, for " when I cast my eye on the known qualities of objects, I immediately discover that the relation of cause and effect depends not the least on them." Not being in the impression, it cannot be found in the idea. Now it is here, I apprehend, that Hume is to be met. I have disputed his theory that the mind begins with mere impressions; it commences with the perception or knowledge of objects within itself, and without itself. Now, in its primitive perception of objects, it knows them as having power; it knows self as a power, and it knows the not-self as a power, -- as a power in resisting and

impressing the self. Here is the *impression,* if any one will call it so (I call it knowledge), that gives rise to the idea which may be separated in thought by abstraction, and put in the form of-- a maxim by generalization.

Unfortunately, as I think, the opponents of Hume have {143} not always met him at the proper point. They have allowed him that we have no original knowledge of power in the objects, and having given this entrance to the sceptic, they find great difficulty in resisting his farther ravages. Sometimes they have endeavored to discover a *nexus* of some kind *between* the cause and its effect, but have always failed to tell what the bond is. Causation is not to be regarded as a *connection between* cause and effect, but a power in the object, that is, substance (or objects and substances), acting as the cause to produce the effect. Kant labored to oppose the scepticism of the Scotchman by supposing that the mind, by its own forms, bound together events in its contemplation of them. But when he allowed that the power was not in the objects, he introduced a more subtle and perilous scepticism than that which he sought to overthrow. We avoid this subjective idealism by insisting that it is on the bare contemplation of a thing becoming, and not by the mere association of ideas and custom (which may aid), that we declare that it must have had a cause.

He is now prepared to discuss two questions: "Why we attribute a continued existence to objects even when they are not present to the senses, and why we suppose them to have an existence distinct from the mind and perception?" He shows, as to the first, the senses give us nothing but a present perception; and, as to the second, that our perceptions being of ourselves, can never give us the least intimation of any thing beyond. He dwells in the usual manner on the acknowledged unreality of what have been called the secondary qualities of matter, and as we naturally look upon the primary qualities, such as motion and solidity, and the secondary qualities, such as colors, sound, heat and cold, as alike real, so we must philosophically consider them as alike unreal. After the manner of the times, he rejects the notion that we can immediately perceive our bodily frame, and not mere impressions, and that we can know both the" objects and ourselves." But whence, it is asked, the coherence and constancy of certain impressions? He accounts for it on the principle that the thought, according to the laws of association, slides from one impression to others with which it has been joined, and reckons them the same, and mistakes the succession of images for an identity of objects. {144}

The result reached by him is," All our distinct perceptions are distinct existences," and ,the mind never perceives any real connection among distinct existences." "What we call mind is nothing but a heap or collection of different impressions united together by certain relations, and supposed, though falsely, to be endowed with a perfect simplicity and identity." He gives the same account of what we call matter. He shows that having nothing but impressions, we can never, on the mere ground of a conjunction which we have never witnessed, argue from our perceptions to the existence of external continued objects; and he proves (very conclusively, I think, on his assumption), that we could never have any reason to infer that the supposed objects resemble our sensations.[40] He now draws his sceptical conclusion: " There is a direct and total opposition betwixt our reason and our senses, or, more properly speaking, betwixt those conclusions which we form from cause and effect, and those that persuade us of the continued and independent existence of body. When we reason from cause and effect, we conclude that neither color, sound, taste, nor smell have a continued and independent existence. When we exclude these sensible qualities, there remains nothing in the universe which has such an existence."

The question is: How is such a scepticism to be met? Reid opposed it by showing that the sensation

leads us intuitively to believe in the existence of the external thing, and that the states of self, known by consciousness, imply a thinking substance. {145} The more correct statement seems to me to be, that we know at once the external objects; that intuitively we know our own frame and objects affecting it; that we are conscious, not of states arguing a self, but of self in a certain state; and that, on comparing a former self recalled by memory and a present self known by consciousness, we declare them to be the same. Kant certainly did not meet the scepticism of Hume in a wise or in an effective manner, when he supposed that the unity was given to the scattered phenomena by forms in the mind.

It is clear that all the usual psychological arguments for the immateriality and immortality of the soul are cut up and destroyed by this theory. We cannot speak of the soul as either material or spiritual, for we know nothing either of matter or spirit except as momentary impressions. The identity which we ascribe to the mind of man is only a fictitious one." Identity is nothing really belonging to these different perceptions, but is merely a quality which we attribute to them because of the union of their ideas in the imagination, when we reflect upon them.

His theory of causation undermines the argument for the divine existence. He carefully abstains from dwelling on this in his great philosophic work, but he expounds it at great length, and with all his intellectual power, in his " Dialogues on Natural Religion." We know nothing of cause, except that it has been observed to be the antecedent of its effect; when we have noticed an occurrence usually preceded by another occurrence, we may on discovering the one look for the other. But when we have never seen the events together, we have really nothing to guide us in arguing from the one to the other. We can argue that a watch implies a watchmaker, for we have observed them together; but never having had any experience of the making of a world, we cannot argue that the existence of a world implies the existence of a world maker. There is no effective way of answering this objection, but by maintaining that an effect necessarily implies a cause. It was on this ground that he was met by Reid, who argues that traces of design in God's works argue an intelligent cause. Kant deprived himself of the right to argue in this way, by making the mind itself impose the relation of causation on events, {146} so that we cannot argue that there is a corresponding law in the things themselves. Hume urges with great force and ingenuity, as Kant did after him, that if we are compelled to seek for a cause of every object, we must also seek for a cause of the Divine Being. This is to be met by showing that our intuitive conviction simply requires us to seek for a cause of a new occurrence. He argues, as Kant also did after him, that the existence of order in the universe could at best prove merely a finite and not an infinite cause. The reply is, that we must seek for the evidence of the infinity of God in the peculiar conviction of the mind in regard to the infinite and the perfect.[41]

This may be the most expedient place for stating and examining his famous argument against miracles, as advanced in his essay on the subject. It is clear that he could not argue, as some have done, that a miracle is an impossibility, or that it is contrary to the nature of things. He assails not the possibility of the occurrence of a miraculous event, but the proof of it. Experience being with him the only criterion of truth, it is to experience he appeals. He maintains that there has been an invariable experience in favor of the uniformity of nature, and that a miracle being a violation of a law of nature, can never be established by as strong proof as what can be urged against it. He then exerts his ingenuity in disparaging the evidence usually urged in behalf of miraculous occurrences, by showing how apt mankind are to be swayed on these subjects by such principles as fear, wonder, and fancy. We are not {147} sure whether Hume has always been opposed in a wise or judicious manner by his opponents on this subject. It is of little use showing that there is some sort

of original instinct leading us to believe in testimony; for this instinct, if it exists, often leads us astray, and we must still go to experience to indicate what we are to trust in and what we are to discard. But the opponents of Hume were perfectly right when they showed, that in maintaining that nature always acted according to certain mundane laws, he was assuming the point in dispute. Let us admit that the whole question is to be decided by experiential evidence. Let us concede that in the present advanced state of science there is ample evidence that there is a uniformity in nature; but then let us place alongside of this a counterpart fact, that there is a sufficient body of evidence in favor of there being a supernatural system. For this purpose let the cumulative proofs in behalf of Christianity, external and internal, be adduced; those derived from testimony and from prophecy, and those drawn from the unity of design in the revelation of doctrine and morality, and from the character of Jesus; and we shall find that in their consistency and congruity they are not unlike those which can be advanced in behalf of the existence of a natural system.

In Book Second of his Treatise, Hume treats of the passions. It is the most uninteresting part of his writings. The reading of it is like travelling over an immense plain, which looks inviting at the distance, but in which we find no spots of fertility or of historical interest. It looks as if the good-humored but phlegmatic man were incapable of discussing the nature of the passions. The composition, though clear and sustained, is never elevated by bursts of feeling or irradiated by gleams of genius. He has a theory to support, and he defends it by wiredrawn ingenuity. When he treats of the understanding, if be does not establish much truth, he at least overthrows venerable error, and we are constrained to admire his intellectual energy and courage; but, in dealing with the feelings of our nature, he wastes his strength in rearing a baseless fabric, which, so far as I know, no one has ever adopted, and no one has been at the trouble to assail. He has no proper analysis of man's original springs of action. He says only in a general way, that "the chief spring or actuating {148} principle of the human mind is pleasure and pain." He gives no psychological account of the place which the idea or apprehension of an object as good or evil, or rather as appetible or inappetible, has in all feeling. Of course, all passions are according to him impressions, only he calls them reflective impressions, to distinguish them from sensations. The reflective impressions are of two kinds, the calm and the violent; the first including beauty and deformity, and the latter such passions as love and hatred, grief and joy, pride and humility. He connects his theory of the passions throughout with his theory of the understanding. There are associations among the passions, as there are associations among ideas; only he says, that while ideas are associated by resemblance, contiguity, and causation, impressions are associated only by resemblance. There has as yet been no thorough examination, so it appears to me, of the laws of succession of feeling, as distinguished from that of ideas; I am not convinced that the theory of Hume, that feelings are associated only by resemblance, is the correct one. He draws a distinction between the cause and the object of passion. Thus if a man has made a beautiful house, the object of the passion is himself, and the cause is the beautiful house. The idea of ourselves is always present with, and conveys a' sensible degree of vivacity to the idea of any other object to which we are related; in short, turns the idea into an impression. Some other person is the object of love, but the cause of that passion is the relation of that person to self. Out of this may proceed the desire of happiness or misery of others, which he describes "*as an arbitrary and original instinct implanted in our nature*," -- I put the language in italics, as I may have occasion again to refer to it. In this way he constructs an elaborate, but by no means clear, theory of the passions. He divides them into direct and indirect. By direct, he understands such as arise immediately from good or evil, that is, from pain or pleasure. He says of them: " The direct passions frequently arise from a natural

***impulse or instinct, which is perfectly unaccountable*. Of this kind is the desire of punishment to our enemies and of happiness to our friends, hunger, lust, and a few other bodily appetites." Under the direct, he includes desire, aversion, grief, joy, hope, fear, despair, and security. The indirect proceed {149} from the same principles, but by conjunction with other qualities; and he comprehends under them pride, humility, ambition, vanity, love, hatred, envy, pity, malice, generosity, with their dependents. It may be said of his exposition of the passions generally, that he has often seized on important circumstances which modify their action, but has altogether failed in his explanation of their nature. Thus he has some just remarks upon the transition of one idea to another, upon the effects thus produced, and upon the predominant passion swallowing up the inferior; but after all we have no proper evolution of the psychological process.**

He occasionally refers to beauty, but the account he gives of it is very inadequate. "Beauty is such an order and construction of parts, as either by the primary constitution of our nature, or by custom, or by caprice, is fitted to give a pleasure and satisfaction to our souls." "The conveniency of a house, the fertility of a field, the strength of a horse, the capacity, security, and swift-sailing of a vessel, form the principal beauty of these several objects." It is clear that the aesthetic tastes of one satisfied with such a theory could not have been keen, and we do not wonder to find that in the letters written during his travels, he never makes a single allusion to a fine statue or painting.

The account which he gives of the will is still more defective. "The will is the internal impression we feel and are conscious of, when we knowingly give rise to any new motion of our body." Surely we may have will in regard to our mental operations as well as in regard to our bodily motions. The will, he says, is an impression, but surely it is an impression of a very peculiar kind; and he should have inquired, which he has not done, into its nature, when he would have seen that it possesses an essential freedom. As not perceiving this, he has left nothing to save man from being driven on by an iron necessity.

In Book Third, he treats of morals, and starts his utilitarian theory, which, however, he develops more fully, and in a livelier, more pointed, and ornate manner, in his essay, ,An Inquiry concerning the Principles of Morals." He says of this work, that it is " of all my writings, historical, philosophical, or literary, incomparably the best." In respect of practical influence, {150} it has certainly been the most important. By his speculative doubts in regard to the operations of the under standing he has furnished a gymnastic to metaphysicians ever since his time; but by his theory of virtue he has swayed belief and practice.

He shows that we cannot distinguish between good and evil by reason alone, defining reason as the discovery of truth or false hood, and truth and falsehood as consisting in the agreement or disagreement, either to the real relation of ideas, or to real existence and matter of fact. Taking reason in this sense, it certainly cannot be said to discern the morally good. But then it may be maintained that the mind has a power of discerning moral good and evil analogous to the reason which distinguishes truth and falsehood, and all that he could urge in opposition would be, that such a view is inconsistent with his theory of impressions and ideas. It is by no means clear what is the faculty or feeling to which he allots the function of perceiving and approving the morally good. Sometimes he seems to make man a selfish being, swayed only by motives of pleasure or pain; and in this view virtue is to be regarded as good, because associated directly or indirectly with the pleasure it would bring to ourselves. But in other places he calls in a " benevolent sentiment, leading us to approve what is useful." Hume's general theory might certainly seem op posed to every thing *innate*, and yet, in criticising Locke, he is obliged to say: " I should desire to know what can be meant by asserting that self-love or resentment of injuries, or passion between the sexes, is

not innate." We have already quoted passages in which he appeals to instincts. He says elsewhere, "The mind, by an *original* instinct, tends to unite itself with the good, and avoid the evil." At times he seems to adhere to the theory of Shaftesbury and Hutcheson, as to the existence of a moral sense. "The mind of man is so formed by nature, that upon the appearance of certain characters, dispositions, and actions, it immediately feels the sentiment of approbation or blame." He tells us expressly that he is inclined to think it probable that the final sentence in regard to moral excellence "depends on some internal sense or feeling which nature has made universal in the whole species." I believe that we cannot account for the ideas in the mind except by calling in {151} such a faculty or feeling; and it was his business, as an experimental inquirer, to ascertain all that is in this power, and to determine its mode of operation and its laws. But such an investigation would have overthrown his whole theory, metaphysical as well as ethical.

According to Hume, virtue consists in the agreeable and useful. "Vice and virtue may be compared to sounds, colors, heat and cold, which, according to modern philosophy, are not qualities in objects, but perceptions in the mind." " Virtue is distinguished by the pleasure, and vice by the pain, that any action, sentiment, or character gives us by the mere view and contemplation." This theory goes a step farther than that of Hutcheson in the same direction. Hutcheson placed virtue in benevolence, thereby making the intention of the agent necessary to virtue; whereas Hume does not regard it as necessary that it should be voluntary, and requires us to look merely to the act and its tendency. His definition might lead one to think that an easy road or a pleasant carriage should be regarded as virtuous. But he will not admit that because an inanimate object may be useful as well as a man, that therefore it ought also to merit the appellation of virtuous; for he says: ,The sentiments excited by utility are in the two cases very different, and the one is mixed with affection, esteem, approbation, and not the other." This language, more particularly the phrases "esteem" and "approbation," might leave led him to discover that there is a peculiar judgment or sentiment attached to virtuous action not produced by mere utility.

He easily satisfies himself that he can show that benevolence is a virtue because it is so agreeable and useful; but he never faces the real difficulty, which is to account for the sense of obligation which we feel, and the obligation actually lying upon us, to do good to others.[42] He strives to show that justice is commended by us because of its beneficial tendency. justice can have a meaning, he maintains, only in regard to society and arrangements made with others. True, the giving to every one his due, implies beings to whom the due is to be {152} given; but the due arises from the relation in which we stand to these beings. Thus the first man and woman having children, had duties to discharge towards them as soon as they were born, and independent of any promise. He labors to prove that our obligation to keep a promise arises from utility. " Fidelity is no natural virtue, and promises have no force antecedent to human conventions." True, a promise implies a person to whom it is made, but, once made, the obligation is complete.

This leads us at once to the fundamental objections which may be taken to the utilitarian theory. Whence the obligation lying on us to promote the happiness of others? to give others their due? to keep our promises? From their utility, it is answered. But why are we bound to attend to what is useful? is the question that immediately occurs; why the reproach that follows, and which justifies itself when we have failed to keep our word? These questionings bring us to a justice which guards conventions, to a law which enjoins love.

The practical morality sanctioned by the system, and actually recommended by Hume, excludes all the higher virtues and loftier graces. The adoration of a Supreme Being, and love to him, are

represented as superstition. He has no God to sanction the moral law, and no judgment day at which men have to give in an account. Repentance has and can have no place in a system which has no fixed law and no conscience. Humility, of which he treats at great length, is disparaged. The stern virtues of justice, of self-sacrifice, of zeal in a good cause, of faithfulness in denouncing evil, and of courage in stemming the tide of error and corruption, these are often so immediately disagreeable, that their ultimate utility will never be perceived except by those who are swayed by a higher principle. It is certain that they were not valued by Hume, who speaks of them as superstition and bigotry, and characterizes those who practise them as zealots and fanatics. His view of the marriage relation was of a loose and flexible character, and did not profess to discountenance the evil practices of his time. "A man in conjoining himself to a woman is bound to her ac cording to the terms of his engagement: in begetting children, he is bound by all the ties of nature and humanity to provide for their sustenance and education. When he has performed {153} these two parts of duty, no one can reproach him with injustice or injury." Not acknowledging a God bestowing the gift of life, and requiring us to give an account of the use we make of it, and setting no value on courage in difficulties, he argues that a man may take away his life when it is no longer useful.

The state of society which he aimed at producing is thus described: " But what philosophical truths can be more advantageous .to society than those here delivered, which represent virtue in all her genuine and most engaging charms, and make us approach her with ease, familiarity, and affection? The dismal dress falls off with which many divines, and some philosophers, have covered her, and nothing appears but gentleness, humanity, beneficence, affability; nay, even at proper intervals play, frolic, and gayety. She talks not of useless austerities and rigors, suffering and self-denial." People have often speculated as to what Hume would have taught had he been elected professor of moral philosophy in Edinburgh. I believe he would have expounded a utilitarian theory, ending in the recommendation of the pleasant social virtues; speaking always respectfully of the Divine Being, but leaving his existence an unsettled question.

And what, it may be asked, is the conclusion to which he wishes to bring us by his whole philosophy? I am not sure that he has confessed this to himself. Sometimes it looks as if his sublime aim was to expose the unsatisfactory condition of philosophy, in order to impel thinkers to conduct their researches in a new and more satisfactory manner. " If, in order to answer the doubts started, new principles of philosophy must be laid, are not these doubts themselves very useful? Are they not preferable to blind and ignorant assent? I hope I can answer my own doubts; but, if I could not, is it to be wondered at? " I verily believe that this was one of the alternatives he loved to place before him to justify his scepticism. " I am apt," he says, in writing to Hutcheson, " to suspect in general that most of my reasonings will be more useful in furnishing hints, and exciting people's curiosity, than as containing any principles that will augment the stock of knowledge that must pass to future ages." But I suspect that the settled conviction reached by him was that no certainty could be attained in speculative philosophy; he was sure {154} that it had not been attained in time past. The tone of the introduction to his great work is: " There is nothing which is not the subject of debate, and in which men of learning are not of contrary opinions. If truth be at all within the reach of human capacity, it is certain it must be very deep and abstruse; and to hope we shall arrive at it without pains, while the greatest geniuses have failed with the utmost pains, must certainly be esteemed sufficiently vain and presumptuous." As being thus deep, he feels as if the great body of mankind need not trouble themselves much about it. He seems at times complacently to contemplate this as the issue to which he would drive mankind for he sees at once

that if men become convinced that they cannot reach certainty in such speculations, they will give up inquiry. " For nothing is more certain than that despair has almost the same effect upon us as enjoyment, and that we are no sooner acquainted with the impossibility of satisfying any desire than the desire itself vanishes and he thinks it a satisfactory condition of things when men discover the impossibility of making any farther progress, and make a free confession of their ignorance. Considered in this light, Hume's philosophy, in its results, may be considered as an anticipation of the positive school of M. Comte, which in the British section of it approaches much nearer the position of Hume than most people are aware of.

He allows that man should, as indeed he must, follow his natural impulses, and the lessons of experience, as far as this world is concerned. But he will grant nothing more. He thus closes his inquiry into the understanding: "When we trace up the human understanding to its first principles, we find it to lead us into such sentiments as seem to turn into ridicule all our past pains and industry, and to discourage us from future inquiries." "The understanding, when it acts alone, and according to its general principles, entirely subverts itself, and leaves not the lowest degree of confidence in any proposition, either in philosophy or common life." In common life this scepticism meets with insuperable barriers, which we should not try to overcome. But it is different with philosophical, and, we may add, theological truths, which are supported solely by speculative considerations. In these departments {155} we may discuss and doubt as we please, without doing any injury. " What injury can ever come from ingenious reasoning and inquiry? The worst speculative sceptic I ever knew was a much better man than the best superstitious devotee." Those who think they can reach truth in these matters are at liberty to cherish their conviction, provided always that they do not thereby disturb their neighbors. But the time is coming, and already wise men see that it is coming, when mankind will not concern themselves with such speculative questions, or will engage in them only as a gymnastic to the intellect, or as a means of showing that ultimate truth is unattainable by man.

It was, I believe, on such grounds as these that Hume justified himself in his sceptical doubts, and his sceptical solution of these doubts. He thought they might stir up inquiry on subjects on which no truth had been reached; and tend to confound the dogmatism and restrain the disputations in philosophy, and the fanaticism and superstition in religion, which had wrought such mischief; and prepare the way for a reign of universal toleration. As to religious belief, it could be supported only by speculative arguments, derived from an absolute causation, or from miracles which cannot stand a searching investigation. So far as men follow a moderate and tolerant religion, Hume was rather pleased with them, and he evidently shrank from the fanatical atheism avowed by some of the more advanced followers of the system in France. If there be a world to come, it will clear up itself when it comes; and, meanwhile, there are duties which we must perform, from a regard to ourselves and our relation to others. There had hitherto been no science of metaphysics; but there could be a science of ethics (and also of politics) founded on the circumstance, that certain acts are found to be agreeable and useful to ourselves and others.

It is in this way we are to reconcile certain seeming inconsistencies in his character. He had no settled faith in any religion, yet he went to church, at least at times; he wished his servant to go to church, and he mingled in the counsels of the Church of Scotland. He never committed himself to deism or atheism. He wrapped up his thoughts on these subjects in his bosom, perhaps with some feeble hope that he {156} might get light; but the cloud seems only to have settled more deeply upon him. When the pert Mrs. Mallet met him one night at an assembly, and boldly accosted him, " Mr. Hume, give me leave to introduce myself to you: we deists ought to know each other," "

Madam," replied he, " I am no deist: I do not style myself so, neither do I desire to be known by that appellation." He did not avow himself an atheist in Paris. Sir Samuel Romilly has detailed a characteristic anecdote told of him by Diderot. He dined with a large company at the house of Baron D'Holbach. "As for atheists," said Hume, " I do not believe one exists: I have never seen one." " You have been a little unfortunate," said the baron: " here you are with seventeen of them at the table for the first time." We may suppose there was some sincerity in the statement he made: " I have surely endeavored to refute the sceptic with all the force of which I am master, and my refutation must be allowed to be sincere because drawn from the capital principles of my system," only he was not prepared to review his system. In writing to Elliott, he says he wishes to make Cleanthes, the theist, the hero of the dialogue. Adam Ferguson told his son, who reports the incident, that one clear and beautiful night, when they were walking home together, Hume suddenly stopped, looked up to the starry sky, and said, " O Adam, can any one contemplate the wonders of that firmament, and not believe there is a God! " Dr. Carlyle tells us, that when his mother died he was found in deepest affliction and a flood of tears, upon which Mr. Boyle said to him that his uncommon grief arose from his having thrown off the principles of religion; to which he replied: " Though I throw out my speculations to entertain the learned and metaphysical world, yet in other things I do not think so differently from the rest of the world as you imagine." In whatever way we may account for it, there was evidently a consistency in the character of Hume which made him respected by his worldly friends, who thought a man might be good, though he had no godliness.

The all-important question is, How is this spirit to be corrected, this error to be met?

***First.* It must be firmly maintained that an honest mind can spontaneously attain such truth, secular, moral, and religious, {157} as is needful to its peace and progress. This truth does not lie deep down in some pit, which can be reached only by deep down, or whence it can be drawn only by the cords of lengthened ratiocination; it lies on the surface, and may be seen by immediate perception, or picked up by brief discursive processes. By this spontaneous exercise of our faculties and common observation, we reach the existence of God, the accountability of man, and a day of judgment. By such an easy method we rise to a belief in the Word of God, and in the spiritual verities there set forth. We should hold that man reaches all this by as natural a procedure as that by which he comes to know what path he should take in the common affairs of this life. No doubt be will at times meet with difficulties, but this only as he may be beset by perplexities in the affairs of this world; and in the one case, as in the other, the sincere mind has commonly enough of light to guide it.**

Secondly. It should be held that he who undermines the fundamental truth spontaneously discovered, is doing an injury to humanity. Scepticism, as Hume delights to show, can produce no mischief in the common secular affairs of life, because there are circumstances which keep men right in spite of their principles, or want of principles. But it is very different in respect of those questions which fall to be discussed in higher ethics and theology. A man will not be tempted by any sophistry to doubt the connection of cause and effect when he is thirsty and sees a cup of water before him; in such a case he will put forth his hand and take it, knowing that the beverage will refresh him. But he may be led by a wretched sophistry to deny the necessary relation of cause and effect when it would lead him upward from God's works to God himself, or induce him to seek peace in Him. Hence the importance of not allowing fundamental truth to be assailed; not because the attack will have any influence on the practical affairs of this life, but because it may hold back and damp our higher aspirations, moral and religious. Hume hoped that his scepticism might

soften asperities, but he did not wish to think that any bad influences could follow from it. On one occasion he was told of a banker's clerk in Edinburgh, of good reputation, who had eloped with a sum of money; and the philosopher wondered greatly what could {158} induce such a man thus to incur, for an inconsiderable sum, such an amount of guilt and infamy. "I can easily account for it," said John Home, "from the nature of his studies, and the kind of books he was in the habit of reading." "What were they," said the philosopher. He was greatly annoyed when told, Boston's "Fourfold State," and Hume's "Essays." Certainly the youth must have been in a perplexed state who had been converted from a belief in the " Fourfold State" by Hume's " Essays," or who was hesitating between them. Thirdly. The philosopher must undertake a more important work. He must inquire into the nature of fundamental truth; he must endeavor to unfold the mental powers that discover it, and to expound their mode of operation, and their laws. He cannot indeed prove first truths by mediate evidence, for if they were capable of probation they could not be first truths; but he can show that they are first truths perceived by immediate cognition of the objects, and in no need of external support. He must as far as possible clear tip the difficulties and perplexities in which the discussions in regard to them have become involved. In particular, he must show that while the reflex consideration of the ultimate principles of knowledge often lands us in difficulties, the principles them selves never lead us into positive contradictions; and that, therefore, while we allow that the human faculties are limited, we cannot admit that they are deceptive. This is what has been attempted by one philosopher after another since the days of Hume.

In fact, all later philosophy springs directly or indirectly from the thorough-going examination to which the Scotch sceptic had subjected received truths. It has been the aim of the Scottish school, as modified and developed by Reid, to throw back the scepticism of Hume. Reid tells us that he once believed the received doctrine of ideas so firmly as to embrace the whole of Berkeley's system along with it, till, on discovering the consequences to which it had been driven by Hume, he was led to review the whole theory and abandon it. Kant declares that he was roused from his dogmatic slumbers by the assaults of the Scottish sceptic, and was thus impelled to the task of repelling the attack. It is scarcely necessary to say that all other philosophies, deserving the name, which have {159} originated within the last hundred years, have ramified directly or indirectly from the Scottish and the German schools; one school, the French school of M. Cousin, seeking to combine the two.

It is interesting to observe the respective ways in which the Scottish and the German metaphysician sought to meet the great sceptic. It is evident that his assaults might be repelled at one or other of two places: either where the foe has entered, or after he has made certain advances. That the mind begins with impressions and goes on to ideas, which are mere reproductions of impressions,-this is the fundamental principle of Hume. Now this may be denied, I think should be denied. On what ground, we ask, does he allow the existence of impressions and ideas? When he answers, we can show him that on the same ground he must admit more; that he must allow that the mind has convictions in regard to its own existence, and the existence of external objects, and perceptions of moral goodness. But again, he may be met at the farther stages of his progress. He asserts that the mind can reach no truth except such as it gets from experience. It may be shown in opposition that it has an original furniture in the shape of tendencies and laws which lead to and guarantee necessary and eternal truth. It is interesting to observe that Reid met him at both these points. Reid made a very careful inquiry into the nature of the senses as inlets of knowledge; and showed that accompanying the sensation there is always an intuitive perception of an external

world. He showed too, though he did not make so much of it as he might, that consciousness is a mental faculty and a source of knowledge. He farther met the sceptic at the more advanced point, and proved that the mind has a primitive reason or common-sense which decides at once that things are so and so; that every effect, for instance, must have a cause. I am not of opinion that Reid has thoroughly cleared up these subjects, that he has detected all that is in the senses, that he has unfolded fully the laws of intuition and its mode of operation; but he has established enough to repel the assaults of the sceptic.

Reid possessed many of the best qualities of his countrymen; in particular, he was shrewd and independent: but he was not {160} endowed with great powers of logical analysis. On the other hand, Kant was strong where Reid was weak; that is, in power of dissection and construction: but was deficient where Reid excelled, in patient observation. He neglected, as I think most unfortunately, to oppose the fundamental principle of Hume. He allows that the mind begins with *phenomena* in the sense of appearances, and these phenomena are just the *impressions* of Hume. But if it be allowed that in the original inlet we have only impressions or phenomena, it never can be satisfactorily shown how we can reach reality by any composition or decomposition of these. Kant exercised his vast powers in meeting Hume at the other point; that is, in showing that there is an priori furniture in the mind, independent of all experience. But what he built with the one hand he took down with the other. For these *a priori* forms could not, in his theory, guarantee any objective reality. He accepts the conclusion of Hume, and allows that the speculative reason could not guide to truth; he goes so far as to maintain that it lands us in contradictions. This philosophy, intended to overthrow the scepticism of Hume, has thus led to a scepticism which has had a more extensive sway than that of the cold Scotchman ever had. He endeavored to save himself from such an issue by calling in a practical reason, which guaranteed as its corollaries the freedom and immortality of the soul, and the Divine existence. But it was immediately asked how it could be shown that the practical reason does not deceive, after it has been conceded that the speculative reason leads to illusion? Thus the insecure mound, raised with such labor to stem the flood, only aggravated the outburst and overflow as it gave way.

Sir W. Hamilton sought to unite Reid and Kant, but was never able to weld thoroughly together the principles which he took from two such different sources. His doctrines of the relativity of knowledge, and of causation as a mere impotency of the mind, have prepared the way for a doctrine of nescience now largely espoused. Some of his pupils have betaken themselves to a sort of confused Berkeleyanism mingled with Kantism, which will furnish an easy passage to the nescient theory in so shrewd a nation as Scotland, and among so practical a people as the English. Mr. Mill, in his examination {161} of Hamilton's Philosophy, has brought us to a *Humism* joined to Comtism. This is the dismal creed provided for those who choose to follow the negative criticisms. of the day in philosophy and theology. What we need in these circumstances is a new Thomas Reid, not to do over again the work which the common-sense philosopher did, but a corresponding service in this age to what he did in his time.

"David Hume"

An Historical and Critical Account of the Living Authors of Great-Britain

William Rider

1762

Editor's note: William Rider (1723-1785) was a chaplain, lecturer, and author of *A New Universal Dictionary*, *A New History of England*, and *The Christian Family's Bible*. Rider's brief *Historical and Critical Account*, only 34 pages, is distinguished as one of the first compilations of biographies of living British authors. The pamphlet was published by Rider himself, anonymously, with the closing initials "W.R." hinting at its authorship; its full title is *An Historical and Critical Account of the Lives and Writings of the Living Authors of Great-Britain. Wherein their respective Merits are discussed with the utmost Candour and Impartiality*. The complete list of authors covered, famous and obscure, are Young, Johnson, Lockman, Smollet, Hume, Goldsmith, Hawkensworth, Coleman, Bickerstaff, Cleland, Thornton, Foote, Sheridan, Havard, Garrick, Murphy, Sterne, Churchill, Lloyd, Derrick, Glover, Akenside, Armstrong, Whitehead, Franklin, Mason, Newton, Chandler, Barron, Borke, Earl of Cork, Littleton, Dodsley, Newbury, Lenix, Pilkington, Rolt, Rider, Millar, Nugent, Floyd, Hiffernan, Hill, Grey, Bower, Warburton, Hurd, Spence, Barrow, and Lardner. Rider's sketch of himself is as follows:

> **THE Rev. Mr. *William Rider* is Assistant Master to St. *Paul*'s-School. He wrote an *English* Dictionary, dedicated to Mr. *W. Pitt,* which would, doubtless, have been much better received by the Public, if the great Mr. *Johnson* had not been beforehand with him in that Task. His *History of England* has been very well received by the Public, and is indeed wrote with a great Accuracy and Erudition. Mr. *Rider*, as he understands the *Saxon, Teutonic, Welsh, &c.* has given in his History many Particulars which have escaped Authors unacquainted with those Languages.**

The *Critical Review* comments on this work that "This is such a contemptible catchpenny, that the publisher has been ashamed to set his name to the production." They also attack Rider for being

unqualified, leaving out key writers, and for factual errors (1762, Vol. 13, pp. 441-442). A largely negative review also appeared in the *Monthly Review* (1762, Vol. 26, pp. 391-392). Negative comments aside, Rider's sketch of Hume is important for being the first known printed biography of Hume. The following is from the 1762 and only edition of Rider's pamphlet.

Mr. HUME

{12}

IT must be acknowledged, for the Honour of *Scotland*, that it has in the present Age produced more Men eminent for having cultivated Literature {13} with Success, than either *Great-Britain* or *Ireland*. *David Hume*, Esq. who reflects so high an Honour upon that Country of which he is a Native, was formerly Secretary to Lord *Albemarle*, when Ambassador at the Court of *France*. As an Author, he must be allowed to possess a considerable Share of Merit. His *Essays* are equally elegant and profound; but they have been greatly censured on Account of the Vein of Scepticism, which runs through them. Those, however, who consider them as Works of Genius, cannot deny them Praise, tho' they are certainly rather superficial in some Places. In History this Author comes the nearest to Dr. *Smollet*; in one Respect he even deserves to be preferred to him; his Observations are much more sagacious and profound; but his Manner is not equally picturesque nor his Style equally pleasing.

Notes

EDITORIAL CONVENTIONS: letters between slashes (e.g., HUME) designate small capitalization. Letters within angled brackets (e.g., *Hume*) designate italics. Note references are contained within square brackets (e.g., [1]). Original pagination is contained within curly brackets (e.g., {1}). Spelling and punctuation have not been modernized. Printer's errors have been corrected without note. Bracketed comments within the end notes are the editor's. This is a working draft. Please report errors to James Fieser (jfieser@utm.edu).]

"An Account of the Life and Writings of the Late David Hume, Esq."

1776

Editor's note: This anonymous account of Hume's life first appeared in a British periodical publication in 1776 (yet to be discovered) and was reprinted later in both *The Annual Register... for the year 1776*, and *The Weekly Magazine, or Edinburgh Amusement*, November 27, 1777, Vol. 38 pp. 193-197. The flattering biography was written sometime after Hume's death, but before the close of the year 1776. The essay is the most detailed account of Hume to appear prior to the publication of Hume's *Life*. It begins with a discussion of the socio-economic conditions under which Hume was raised and how these impacted his choice of an occupation. The author defends both the style and content of the *Treatise* and discusses Hume's account of female chastity as an illustration. He describes Hume's *History* as "certainly the greatest historical work of modern times." The author makes several mistakes of fact and chronology, such as stating Hume's birth year as 1712, and suggesting that Hume's library position commenced around 1742. Shortly after the appearance of the "Account" in *The Weekly Magazine*, an anonymous author, under the pseudonym "Tobias Simple" attacked the "Account" in "Strictures on the Account of the Life and Writings of David Hume, Esq.", *The Weekly Magazine*, December 25, 1777, Vol. 38, pp. 289-293 (see Hume Archives edition of the "Strictures"). The following is from the *The Annual Register* reprint of the "Account".

An Account of the Life and Writings of the late David Hume, *Esq. as given to the World in one of the periodical publications.*

THE lives of literary men seldom abound with incidents. That leisure, which is necessary for the acquisition of knowledge, excludes them in some measure from the busy world, and intense study

seems generally to subdue in them the spirit of enterprize. Few men, even among the learned, had ever less of that spirit than the honest, easy, indolent,but philosophic Hume. His life, consequently, affords few of those occurrences which are commonly supposed to give interest to a biographical narration. But there is a pleasure in tracing the progress of genius, and observing its various obstructions and encouragements, in the road to fame, which has made the lives of authors, though less deversified by circumstances, more universally acceptable than those perhaps of any other class of men. No apology need therefore be made for an attempt to trace the progress of a writer unequalled in his age, or in his province, one of the most eminent and extensive in the empire of science.

David Hume, so well known to the world of late, both as a philosopher and historian, was born about the year 1712, in that part of Scotland which lies between Edinburgh and Berwick. His father was a country gentleman, or laird, of good family, but small fortune, and David was unfortunately a younger son. In his early years, he was by no means distinguished as a scholar, or by any of those accomplishments which are supposed to qualify youth for the liberal professions; but as the pride of the Scottish gentry then prevented them from breeding any of their children to mechanical or mercantile employments; and as the church, in that country, can only be the object of the lower class of people, the best kirks affording no more than a decent maintenance, there was a necessity for every younger son of a genteel family being bred either a soldier, a lawyer, or a physician. -- David was destined for the bar; not so much as being adapted to his genius, as the line in which his relations could most effectually serve him. After passing through his academical courses at the university of Edinburgh, he therefore devoted himself to the study of the Scotch laws, in which he mad considerable progress; but whether from that natural modesty almost inseparably connected with great merit, a consciousness of his deficiency in elocution, the happy indolence of his temper, little fitted for the contentious bar, or any other secret cause, he never put on the gown, not even took the introductory steps necessary for that purpose. Other studies attracted him.

The metaphysical writings of Locke and Berkeley had turned all inquisitive men towards intellectual objects. The human mind spent its force in contemplating itself; as if man had been born for thinking, not acting; as if ideas had, in fact, only been *real*; and that material world, as conjectured by the Bishop of Cloyne, but *as a vision*. Mr. Hume had early applied himself to metaphysical inquiries: he saw, or seemed to see, the defects of the former systems, and published, in 1739, the two first volumes of his *Treatise of Human Nature*, and the third the following year.

This work, though no inferior to any thing of the moral or metaphysical kind in any language, was entirely overlooked, or decried at the time of its publication, except by a few liberal-minded men, who had courage to throw aside their popular and literary prejudices, and to follow sound reasoning without being afraid of any dangerous conclusion, or fatal discovery; of seeing errors unveiled, however sanctified by years, or supported by authorities: and the author made sensible, to the severe disappointment of his youthful hopes, that the taste for systematical writing was on the decline, divided his treatise into separate essays, and dissertations, which he published, with improvements, alterations, and additions, at different periods of his life. His enemies, however, or men desirous of raising a reputation by exposing the mistakes of a great genius, have levelled all their arguments against this juvenile production, though never dignified with the author's name; and Dr. Beattie, in particular, more than thirty years after the publication of that sceptical system, has been so successful as to obtain a pension by his *Essay on the Immutability of Truth*; in which he discovers all the violence of a a sectary, and all he illiberality of a pedant, and rather abuses than

confutes Mr. Hume.[2]

As the *Treatise of Human Nature* is now very scarce, some account of it may be agreeable to many readers. The author's purpose in that work, as he himself informs us, was "to introduce the experimental method of reasoning into moral subjects." The ability with which he has executed his design, can only be fully discovered by an examination of the treatise itself; which, as a composition, is admirable. The first volume treats of the understanding, the second of the passions, the third of morals. Criticism and politics were still necessary to complete his plan, and would have been added systematically, if the success had, in any degree, been answerable to the merit of the work. He thus speaks of the sciences that he meant to examine: "The sole end of logic is to explain the principles and operations of our reasoning faculty, and the nature of our ideas: morals and criticism regard our tastes and sentiments; and politics consider men as united in society, and dependent on each other. In these four sciences, logic, morals, criticism, and politics, is comprehended almost every thing, which it can any way import us to be acquainted with, or which can tend either to the improvement or ornament of the human mind." So early, and when he was thought little able to give a new direction to science, had this great man digested that ingenious system of philosophy, which had changed metaphysics from a frivolous t an useful study; and give a stability to morals, criticism, and politics, unknown in former ages! -- But what is still more extraordinary, the stile and method of this first production are not less correct and happy, than those of his most admired performances, written after his taste and judgment were matured by years and experience. A single quotation will be sufficient to support this assertion, and also to exemplify his method of reasoning *experimentally* on moral subjects.

Speaking of that modesty and chastity which belongs to women, "there are some philosophers," he observes, who attack the female virtues with great vehemence, and fancy they have gone very far in detecting popular errors, when they can shew, hat there is no foundation in nature for all that exterior modesty which we require in the expressions, dress, and behaviour of the fair sex." And he proceeds to examine the origin of such notions, and their connection with the interests of society.

"Whoever considers," says he, "the length and feebleness of human infancy, with the concerns which both sexes naturally have for their offspring, will easily perceive that there must be an union of male and female for the education of the young, and that this union must be of considerable duration. But in order to induce the men to impose on themselves this restraint, and undergo cheerfully all the fatigues and expences to which it subjects them, they must believe that the children are their own, that their *natural instinct* is not directed to a wrong object when they give a loose to love and tenderness.

"Now," adds he, with equal justice and ingenuity, "if we examine the structures of the human body, we shall find that this security is very difficult to be attained on our part; and that since in the copulation of the sexes, he principle of generation goes from the man to the woman, an error may take place on the side of the former, though it be utterly impossible on the side of the latter. In order therefore to impose a due restraint on the female sex, we must attach a peculiar degree of shame to their infidelity, above what arises merely from its injustice, and must bestow proportionable praises on their chastity. But as human creatures, especially of the female kind, are apt to overlook remote consequences, while under the influence of any present temptation, it is necessary, besides the infamy attending such licences, that there should be some preceding backwardness or dread, which may prevent their first approaches, and give the female sex a repugnance to all expressions, and postures, and liberties, that have an immediate relation to that enjoyment.." So much *good sense* and *sound reasoning* was never perhaps delivered in so few

words, on the subject of the female virtue, by any writer ancient or modern; yet this is an extract from the treatise, whose confutation has been impudently attempted, more than once, by mere *common sense and childish declamation*!

In the year 1742, Mr. Hume published two small volumes, consisting of essays, moral, political, and literary. These were better received than his former publication, but contributed little to his general reputation as an author, and still less to his profit; and his small patrimony being now almost spent, he was glad to accept of office of library keeper to the faculty of advocates. The salary annexed to this place is only fifty pounds per annum; but the opportunity which it afforded him of consulting, at his leisure, all he choice authors and valuable papers in one of the best libraries in Europe, may be considered as o inconsiderable circumstance in favour of Mr. Hume's literary character.

In 1746, he stood candidate for the chair of moral philosophy in the university of Edinburgh, then vacant by the resignation of the present Sir John Pringle, appointed physician to the army. Every one was convinced of Mr. Hume;s abilities, and his interest was warmly supported by the nobility and gentry; but the Presbytery of Edinburgh, having a right to object to one out of three candidates named by the town council, they put their negative upon honest David, whose sentiments were too liberal for their narrow minds.

Thus baffled in his attempt to obtain an office for which he was eminently qualified, and in which perhaps he could have been of more service to his country than in any other, Mr. Hume devoted himself entirely to study, and rested all his hopes of fame and fortune on his merit as an author. -- He published in the year 1748 and 49 his Metaphysical Essays nearly as they now stand; a Dissertation on the Passions, also extracted from his Treatise of Human Nature; his System of Morals, much altered and improved: and along with these several new moral, critical, and political essays.

From politics, in which he had now made considerable progress, mr. Hume turned his inquiries towards history, and completed in 1752, the history of Britain under the house of Stuart. The first volume of this work had been published two years before, but was little noticed, and the success of the second was by no means considerable; yet these two volumes are allowed to be equal to any part of his now justly admired History of England, or rather of Britain; for he all along connects the story of the two kingdoms.

So singular an instance of pubic neglect cannot be well accounted for; especially as the style is remarkably elegant, the period interesting, and the work full of new and important matter, anecdotes, and observations. The public, however, has since amply repaid Mr. Hume for its ingratitude. His History of the House of Stuart requires only to be read to be admired; and it no sooner fell into the hands of Mr. Millar, then at the head of the London booksellers, than it became a favourite performance among the higher class of people.

But Mr Hume's reputation as an historian was not complete, till the publication of his History of the House of Tudor, in 175. About the same time was published Dr. Robertson's History of the Reign of Mary, Queen of Scots, and her Son James, till his Accession to the Throne of England; a work which was admired, even to enthusiasm, by persons of all ranks. Many of the same subjects are treated by both writers, and at equal length. A comparison necessarily followed; and all intelligent men became sensible, after the most critical examination, that the philosophic dignity, the logical disposition, the force of diction, the just concatenation of circumstances, the lively pictures of manners, the comprehensive, yet distinct views of the interests of nations, and the

intrigues of courts, independent of the many valuable disquisitions, which so eminently distinguished Mr. Hume's work, were, at least a balance for the classical purity of style, the happy selection of incidents, the keen discernment of motives, and the fine delineation of character no less conspicuous in the other, which render the History of Mary one of the most captivating in our language.

Thus encouraged by the public approbation, Mr Hume prepared for press, with all expedition, the more early part of his History of England, from the invasion of Julius Caesar to the accession of the House of Tudor; which, with the volumes formerly published, bring down the progress of the English constitution, and the civil and military transactions of Britain, to the Revolution in 1688, an aera when the government of this country was fixed on the basis, where it continues to rest. yet it is to be lamented that Mr. Hume did not bring down his history to the death of Q. Anne, when the manners, the literature, and the military reputation of England, and of Europe, were at an height, and when the accession of a new family gave a new direction to British policy. But such as it is, taken as a whole, it may be considered as one of the most excellent productions of the human genius, and is certainly the greatest historical work of modern times.

Mr. Hume's reputation was now complete. He was considered as the greatest writer of the age: his most snsignificant performances were sought after with avidity; and Lord Bute, who, whatever errors he may have been guilty of as a politician, will ever be honoured as a patron of letters, procured for Mr. Hume a considerable pension. -- But it was not enough that the philosophic David should be enabled, in his latter years, to eat the bread of idleness, as the reward of his many laborious researches; his political writings affording reason to believe, that he might be of use to the state, he was appointed secretary to Lord Hertford, ambassador at the court of France, and afterwards resident in the absence of that nobleman.

In France, Mr. Hume's writings had long book known and admired; so that he there found himself of still more consequence by his character than his office. He was universally caressed. Even the ladies are said to have loaded him with their favours. But of all Mr. Hume's adventures, during his residence in France, or in his own country, there is none so remarkable as that which took its rise from his acquaintance with the celebrated John James Rousseau, whom he brought over to England with him in 1766, and for whom he procured the offer of a pension from his Majesty.

The particulars of that affair have been already published, and are too numerous and complicated to enter into such a sketch as the present: it will therefore be sufficient here to observe, that Mr. Hume, understanding that M. Rousseau, persecuted every where on the continent, meant to take refuge in England, generously conducted him over, procured him a commodious retreat, and afterwards the offer of a pension; but that the jealous and peevish temper of Rousseau, led him to reject the last, abandon the first, and abuse Mr. Hume as a person who had conspired the ruin of his character, under an appearance of serving him; though every precaution, which the most refined delicacy could suggest, had been taken in order to spare the pride of that singular man, by the manner of conferring those obligations.

An anecdote or two will sufficiently shew the jealous and even suspicious temper of M. Rousseau, and the generosity and candour of Mr. Hume. On their journey to England, they happened one night to lie in the same chamber; and during the season devoted to sleep, M. Rousseau heard, or imagined he heard, Mr. Hume cry several times, with great vehemence -- "Rousseau, I have you?" these words, though in themselves equivocal, and tho' M. Rousseau owns he does not know whether Mr. Hume uttered them when asleep or awake, roused his suspicions, which it appears

were never afterwards entirely laid. The question which honest David asks on this occasion is equally pertinent and candid. "As M. Rousseau is not certain whether Mr. Hume was asleep or awake, is he sure that he was awake himself?"

M. Rousseau's suspicion of Mr. Hume's treachery rose in proportion to the benefits conferred upon him, and at last broke out in perfect peevishness on the slightest occasion imaginable. Mr. Davenport, a gentleman distinguished by his birth, his fortune, and his merit, had granted to M. Rousseau and his governante, the use of his house called Wooton, in Derbyshire, (where he seldom resided) with all other things necessary for a livelihood; but in order to prevent Rousseau's pride from being hurt by such a benefit, he agreed to receive, in return a trifling sum annually. He also generously pretended, as he had reason to think M. Rousseau's finances were not very high, that he had found a post-chaise, on his return to Wooton, which would carry the philosopher safely, and at small expence, to his retreat. Rousseau suspected the benevolent artifice, and accused Mr. Hume of being an accomplice in it. Mr. Hume protested his innocence, and endeavoured to shift the subject. After a sarcastical reply, Rousseau sat for some time in seeming melancholy, then sprung up, walked two or three times across the room, and at last threw his arms out the neck of his brother philosopher, bathing the astonished David's face with tears, and crying like a child. "My dear friend, said he, as soon as he was able to speak, "will you ever forgive me this extravagance? After all the pains which you have taken to serve me, after the numberless proofs of your friendship, is it possible that I can thus repay your kindness with spleen and abuse! But in pardoning me you will give me a new mark of your regard, and I hope when you know me better, you will find that I am not unworthy of it."

This reconciliation, however, was but of short duration. Still a prey to his former suspicions, his delicacies, and his scruples, Rousseau soon broke out entirely with his benefactor, and left England.

Mr. Hume, who after his return from France, had ben appointed under secretary of state, retired to Scotland on the resignation of Gen. Conway, and spent the remainder of his years at Edinburgh, among the companions of his youth, equally admired and respected; beloved as a friend, and honoured over Europe as a scholar, a gentleman, and a man of genius. He died, after a lingering illness, on the 25th of August, 1776.

"Strictures on the 'Account of The Life and Writings of the Late David Hume, Esq.'"

Weekly Magazine, or Edinburgh Amusement

"Tobias Simple"

1777

Editor's note: This pseudonymous essay is a critique of a 1776 essay titled "An Account of the Life and Writings of the late David Hume, Esq." (see Hume Archives edition of the latter). The critique appeared in *The Weekly Magazine*, December 25, 1777, Vol. 38, pp. 289-292. The author opens attacking Pratt's *Apology* (1777), and Hume's facetious dialogue with Charon reported by Smith in his *Letter to William Strahan*. The author erroneously notes that the "Account" is based on Hume's *My Own Life*, and then focuses his attack on the discussion of chastity from the *Treatise* (as appears on the "Account"). He lists eight skeptical "dogmas" found in Hume's writings, and concludes with a fictitious lecture Hume might have given his students if he obtained the chair of moral philosophy at the University of Edinburgh. The copy text upon which the text below is based is illegible at places; asterisks are inserted where letters or words cannot be deciphered.

{289}

STRICTURES *on the Account of the Life and Writings of* DAVID HUME, *Esq.*

DAVID HUME *is dead!* "Never were the pillars of orthodoxy so desperately shaken,as they are now by that event;" cries, with exultation and triumph, one of his disciples[2] -- "He has proved himself, in opposition to a contrary opinion, one of these rare characters -- an uniform philosopher.["]

Pray Sir, let me ask this gentleman, What has orthodoxy, the *Christian religion* (no doubt you mean?)*, or the religion of nature,* if you please, suffered by that event? Every good man, affected with religious principles, and from a humane concern for a fellow creature, and must have wished, that that philosopher had, in his last moments, expressed some concern for his future existence! he did it not: that he died firm to his own tenets, they are truly sorry for: but how the *pillars of religion can be shaken* by that event, more than by the death of many a *daring atheist* that hath lived and died so, in every age, they don't see. Your philosopher, if it will please you, shall rank in the first class of that sect.

The famous *Vanini,* crying out at *the stake* the name of *God,* was careful to let it be know, that it was an involuntary exclamation.

***Spinoza* shut himself up with his old woman, in his last moments, giving orders, that no divine should be admitted to disturb him.**

The gay *Petronius,* whose exit our hero seems to have had in his eye, having cut his veins, and bound them up again, called his friends about him -- "*Audiebatque*, says the historian*, referentes, nihil de immortalitate anime, et sapientium placitis, sed levia carmina, et faciles versus*."

Our philosopher, as firm as any of them, in his last moments, chearfully entertained his friends with a dialogue between himself and Charon, played a game at Whist, and read Tom Jones.

NO Sir, all this is very well, and stands recorded on good evidence; and no one, I'm persuaded, will pretend to say, that our philosopher, before he made his exit, either called for the *New Testament*, was {290} heard to invoke the Deity, or to utter the shortest ejaculation for his soul. And pray what has orthodoxy, or the Christian religion suffered from all this? have you any grounds for *insulting* the *religion of your country* upon that event?

It was the complaint of the *Free-thinkers* of the last age, that men of genius were not at liberty to canvass with freedom points of religion: that they were obliged to write in fetters, and met with great discouragement in their attempts to investigate, with freedom, these points. How far they had reason for their complaints, may be judged from the writings of *Tindal, Collins, Toland*, and the noble author of the *Characteristics*. It must be owned, indeed, that although these essays are neither remarkable for the spirit of moderation, nor for modesty, yet, simple as the appearance was, they thought themselves obliged, when writing against the religion of their country, to put on a lair out-side. Thus, although they soon unmasked themselves, they carried on the show, by affecting, on every occasion, the specious words of *our holy religion, its divine Founder, the holy gospel, we Christians*, and such like th** in their mouths. This thin ****, it is true, imposed upon nobody, but in some readers, it was an acknowledgement from these gentlemen, that they thought themselves, at least, under an obligation to treat with decency and respect the established religion of their country; and they were sensible too, that it would very ill have become them, while they were declaiming against the intemperate zeal of the early professors of Christianity, for insulting the religion of Paganism, then the established religion, and in extolling the mild forbearance of the *Emperor Julian*, their great hero, if they themselves had incurred the same censure. But times, it seems, are altered: the Free-thinkers of the present age seem to be insensible of the unbounded toleration, the perfect freedom which they now enjoy.**

This leads me to take notice of another abuse of this liberty, in a paper which, Mr. Printer, you have lately given to the public; to wit, "An account of the life and writings of the late David Hume, Esq;" than which, a more gross insult has not been offered, I wont say to religion ** (for, with the *Humean school*, religion, in every sense, is out of the question, but to the *moral sense* and**

common understanding of mankind.

This piece, as it hath appeared first in the Annual Register, and lately in your Weekly Magazine, I mean to examine, and make some observes upon.

It is proper to premise, that the writer of this paper, with respect to the life and writings of the philosopher, notwithstanding his inviting title, has given us only a bald repetition of a few of the anecdotes from Mr Hume's life, written by himself. Of the observations he makes on our author's metaphysical works, I mean only to take notice.

This writer introduces his account with a high swoln panegyric on our author's first metaphysical production, *The Treatise on Human Nature* -- "A work (says *this judge*) not inferior to any thing of the moral, or metaphysical kind in any language." And to justify this very decisive opinion, he is pleased to give us an abstract from our author, with respect to the *principles* of *modesty*, and *chastity of women*, and the necessary restraint they are laid under, in order to preserve their fidelity to their husbands, and to the marriage-bed. Mr Hume says, with truth, that "considering the length and feebleness of infancy, both parents must unite their care in the education of their young; therefore, *a priori*, they must believe that the children are their own." He then proceeds to tell us what is equally true and well known, that

> **"if we examine the structure of the human body, we shall find that this security is very difficult to be attained on our part; and that since, in the copulation of the sexes, the principles of generation goes from the man to the woman, an error may take place on the side of the former, though it be utterly impossible on the side of the latter. In order therefore, to impose a due restraint on the female sex, we must attach a peculiar degree of shame to their infidelity above what arises merely from its injustice, and must bestow proportionable praise on their chastity: But, as human creatures, especially of the female kind are apt to overlook remote consequences while under the influence of any present temptation, it is necessary, besides the infamy attending such licences, that there should be some preceding backwardness or dread, which may prevent their first approaches, and give the female sex a repugnance to all expressions, and postures, and liberties, that have immediate relation to that enjoyment." --**

"So much {291} good sense and sound reasoning (says our observator) was never delivered in so few words on the subject of *female virtue* by any writer ancient or modern." Indeed! "Yet, (proceeds he) this is an extract from the *treatise*," (Reader mark his modestly,) "whose confutation has been *impudently* attempted, more than once, by mere *common sense*," (really!) "and childish declamation."

Equally sensible and modest is this remark! It is scarce possible, indeed, to cram more *conceit* and *nonsense* into fewer words. As for the sense and reasoning contained in the above extract from Mr Hume, it would have been truly absurd in any body to have pretended either to confute, or even to dispute; and I wish this writer had told us who had attempted to do it. As for ingenuity in the extract, or novelty, there is none. Is there an old woman that, without much knowledge of the *human structure*, does not know, that although we can, with no certainty, determine the father, yet there can be no doubt as to the mother of the child? or is it a new discovery of Mr Hume, that in order to impose due restraint on the wise, to preserve inviolate the marriage-bed, it was necessary that, besides the shame, infamy, and even punishment annexed to her breach of fidelity, the utmost caution should be exerted to inculcate the seeds of modesty into the sex from the earliest infancy? Did Dr. Beattie get a pension for impudently attempting to confute this doctrine, not of Mr Hume,

but established in every civilized nation so early as man could have any notion of society? No. But shall I tell this writer what detestable principles of Mr Hume, even subversive of his above doctrine, Dr. Beattie, and several others, have ,with mere common sense, taken upon them to dispute, and, strange as it is, even to confute.

Mr Hume has told us, that *chastity*, considered abstractly from its *utility*, is no virtue: That the principles of chastity respect generation only; it follows, then, that, in women past child-bearing, it is no virtue at all:[3] That adultery ,if frequently practised, would cease to be scandalous; and that, if secretly practised, would be thought no crime.[4] Blessed doctrine this, and tending much to reform the manners of the age! The consequences that may be drawn from these principles shall not be here stated. -- Was our philosopher a a man of gallantry? It is said that he affected the company of women, and the ladies, it is said, loaded him with their favours: For the honour of the *sex*, it is to be hoped that he had few pupils. To every virtuous woman such principles must have appeared shocking and detestable.

This writer tells us,

> **"That, in 1746, Mr Hume stood candidate for the chair of moral philosophy in the university of Edinburgh, then vacant; every one, says he, was convinced of Mr Hume's abilities; but the *presbytery of Edinburgh*, having a right to object to one of the three candidates, they put their negative upon *honest David*, whose sentiments were *too liberal* for their *narrow minds*. As he was eminently qualified for this office, he could have been of more service to his country than in any other."**

Ye illiberal and narrow-minded men of the presbytery of Edinburgh, what hurt did you not do to your country, in depriving it of David Hume for professor of morality! what a blessed system of ethicks would he have instilled into our youth!

> **To laugh were want of goodness, and of grace; And to be grave, exceeds all power of face.**

But let us collect some of the dogmas of our philosopher.

1. "The efficacy of causes (says he) is neither placed in causes themselves, nor in the Deity, but belongs entirely to the soul."[5] The obvious conclusion is, that there is *no first cause*.

2. That we have no good reason to think that the universe proceeds from a cause.[6]

3. That matter and motion may be the cause of thought.[7]

4. That the material world does not exist. -- Allow this to be called in question. What arguments have we to prove the being of God?[8]

5. That neither matter nor spirit exists -- Let us attend to our philosopher's principles of morality. {292}

6. That justice is not a natural virtue, but artificial and arbitrary.[9]

7.That all moral virtues ore of the same nature, i.e. arbitrary, and depending on the custom and institutions of men.[10]

8.That every action of man is necessary.[11]

These are some of the principles, which Dr Beattie has most impudently taken upon him to censure; and, strange to tell, has, with mere common sense, brought the whole *metaphysical system* of our philosopher in ruins about his ears.

Let us suppose, however, that our author had obtained the philosophic chair, he might, no doubt, from the above principles, ** [teach the following]:**

"Now, my students, having inculcated these principles, shake off the fetters of superstition, that is, religion, being convinced there is no first cause: *futurity* is a mere bugbear, as I have demonstrated in a work which I mean at my death to bequeath to you.[12] If notwithstanding the liberal principles I have given you; if, in the practice of the many advantages my tenets must give you over the wives, the daughters, and fortunes of your weak fellow mortals; any of you, from the want of firmness of nerves, weakness of constitution, or from the troublesome intrusion of a certain faculty in the machine, not altogether subdued by my physics, called *conscience*, shall find yourselves disturbed and haunted, there is an easy remedy; suicide is a cure for every disease: For be assured,

> **The worst that can befal you, measur'd right, is a sound slumber and a long good night."**

Can it be said that this speech is not a fair induction from the above principles? I think it cannot. But it will be said, no doubt, that our philosopher was a man of virtue, and a very good member of society: abstracting from the immorality of writing and publishing such principles, I shall allow he was so: What follows? Only this, that his passions for inordinate pleasures luckily were none of the strongest; and that his constitution led him to study, entertaining his friends and the pleasures of the table. But with all that, can any excuse be made for his attempts to take from man, (that wild beast hurried away by passions) the curbs of *justice, chastity, virtue*, and *religion*? What apology can his warmest admirers make for this?

Let me oppose to the above dogmas, only one of the precepts of another *philosopher*, I mean, the divine Instituter of our religion; for, reader, I am not ashamed to own myself one of the people called Christians. This blessed person, whose wisdom came from heaven, knew how prone poor weak mortals were to be led astray by unguarded passions; and that the first inlet to carnal desires ought to be guarded against. Let not even your eye, says he, fix upon such objects as may, by degrees, hurry you on *to vice and criminality*; rather pull it out: For remember that God dwells not with impurity. *Blessed*, therefore, are the *pure in heart*, for they *shall see God*.

Before I conclude, I shall make one observation, which, I dare say, daily occurs to the experience of many others, that is, That the philosophy of our author seems to be very agreeable, and often in the mouths of many of the men of fashion of the age: That he was a very subtile and acute metaphysician, his works shew; yet, amidst all his pretended admirers, it is a certain fact, that no one of a hundred of these fine gentlemen understand him, of which the writer of the account of his life, &c. stands a lamentable proof.

To conclude; may the *Freethinkers* of the present age ever rejoice in their liberty and freedom which they now enjoy; may they always thankfully cry out in the words of the historian; *Rara temporium felicitas, ubi sentire quae velis, et quae stias dicere, ac scribere dicet!*[13] At the same time, let these gentlemen learn to make a better use of that liberty, than *insulting common sense and the religion of their country*.**

Letter from Adam Smith, LL.D. to William Strahan, Esq.

Adam Smith

1777

Editor's note: Adam Smith's *Letter* appeared along with the 1777 publication of Hume's *My Own Life*. Smith's account covers the last four months of Hume's life, relating the progress of Hume's illness, and his cheerful state of mind. In a letter of August 22, 1776 to Hume, Smith suggests the possibility of writing the *Letter* as a supplement to Hume's *Life*:

> **If you will give me leave I will add a few lines to yr. account of your own life, giving some account in my own name of your behaviour in this illness, if, contrary to my own hopes, it should prove your last. Some conversations we had lately together, particularly that concerning your want of an excuse to make to Charon, the excuse you at last thought of, and the very bad reception wh. Charon was likely to give it, would, I imagine, make no disagreeable part of the history. You have in a declining state of health, under an exhausting disease, for more than two years together now looked at the approach of death with a steady cheerfulness such as very few men have been able to maintain for a few hours, tho' otherwise in the most perfect Health. [*Life of Adam Smith*, John Rea, pp. 300-301.]**

To this Hume replied, "You are too good in thinking any trifles that concern me are so much worth you attention, but I give you entire liberty to make what Additions you please to the account of my Life" (*Letters*, Greig, Vol. 2, p. 336). Two days later, on August 25, 1776, Hume died. In October Smith sent a draft of his *Letter* to Hume's brother, John Home, to advise whether "anything either added to it or taken from it." He adds that there "is a propriety in addressing it as a letter to Mr. Strahan, to whom he has left the care of his works" (Rae, p. 304). Home replied generally approving of Smith's *Letter*, but suggested a minor change which Smith made. Shortly after, the manuscript was sent to Hume's publisher, William Strahan. In November, Strahan wrote Smith proposing that Hume's *Life* and Smith's *Letter* be published along with a series of letters with Hume wrote to Strahan over the years. At least part of Strahan's concern was to increase the

size of Hume's *Life* for publication purposes. To this Smith replied that "many of Mr. Hume's letters would do him great honour... " but that Hume's dying wishes should be honored, in particular "to burn all his Papers except the *Dialogues* and the account of his own life." Smith recommended publishing Hume's *Life* as a pamphlet, rather than a volume. A preprint of Hume's *Life* and Smith's *Letter* appeared in the January 1777 edition of *The Scots Magazine*, and the printed pamphlet itself was distributed later in March under the title *The Life of David Hume, Esq. written by himself*. Smith's *Letter* was sharply attacked in newspapers and pamphlets for seemingly glorifying skepticism and infidelity. Such criticism is seen in the following anonymous letter to the *Weekly Magazine, or Edinburgh Amusement*:

> Doubtless the doctor intends a panegyric upon his friend; but in truth the publication of his frolicsome behavior in dying, is a satire which must expose Mr. H---'s memory to the pity, if not to the contempt, of the truly wise.... From the doctor's narrative of Mr H---'s dying behavior, a Christian cannot easily allow that the concluding eulogy of his character fairly follows.... Can anything be more frivolous, more childish, more indecently wanton and presumptuous in a dying man, perceiving himself on the verge of time, than Mr. H---'s sportful dialogue with Charon?... We are told that Mr H--- was quite resigned. Resigned! to what? Not to the will of God.... How miserable the comforter, who could minister no other consolation to his dying friend, than 'that he was to leave his friends in great prosperity!'... Compare together a sceptical philosopher and a scripture saint in dying, and see the abject meanness into which the one sinks -- the grandeur, in hope of everlasting glory, to which the other rises. [Vol. 36, pp. 139-141]

Smith's *Letter* prompted a similar attack by George Horne in his anonymously published *Letter to Adam Smith, LL.D. on the life, Death, and Philosophy of his friend David Hume, Esq.* Ten years after the appearance of Smith's *Letter* he commented that "A single, and as I thought, a very harmless Sheet of paper which I happened to write concerning the death of our late friend, Mr. Hume, brought upon me ten times more abuse than the very violent attack I had made upon the whole commercial system of Great Britain" (William Scott, *Adam Smith as Student and Professor* p. 283). Smith's letter was published with Hume's *Letter* again in 1777, 1778, and in several 19th century editions of Hume's collected Works. The following is from the first 1777 edition of Hume's *Life*.

LETTER FROM ADAM SMITH, LL.D. TO WILLIAM STRAHAN, ESQ. Kirkaldy, Fifeshire, Nov. 9. 1776

Dear Sir,

It is with a real, though a very melancholy pleasure, that l sit down to give you some account of the behaviour of our late excellent friend, Mr. Hume, during his last illness.

Though, in his own judgment, his disease was mortal and incurable, yet he allowed himself to be prevailed upon, by the entreaty of his friends, to try what might be the effects of a long journey. A few days before he set out, he wrote that account of his own life, which, together with his other

papers, he has left to your care. My account, therefore, shall begin where his ends.

He set out for London towards the end of April, and at Morpeth met with Mr. John Home and myself, who had both come down from London on purpose to see him, expecting to have found him at Edinburgh. Mr. Home returned with him, and attended him during the whole of his stay in England, with that care and attention which might be expected from a temper so perfectly friendly and affectionate. As I had written to my mother that she might expect me in Scotland, I was under the necessity of continuing my journey. His disease seemed to yield to exercise and change of air, and when he arrived in London, he was apparently in much better health than when he left Edinburgh. He was advised to go to Bath to drink the waters, which appeared for some time to have so good an effect upon him, that even he himself began to entertain, what he was not apt to do, a better opinion of his own health. His symptoms, However, soon returned with their usual violence, and from that moment he gave up all thoughts of recovery, but submitted with the utmost cheerfulness, and the most perfect complacency and resignation. Upon his return to Edinburgh, though he found himself much weaker, yet his cheerfulness never abated and he continued to divert himself, as usual, with correcting his own works for a new edition, with reading books of amusement, with the conversation of his friends; and, sometimes in the evening, with a party at his favourite game of whist. His cheerfulness was so great, and his conversation and amusements run so much in their usual strain, that, notwithstanding all bad symptoms, many people could not believe he was dying. "I shall tell your friend, Colonel Edmondstone," said Doctor Dundas to him one day, "that I left you much better, and in a fair way of recovery." " Doctor," said he," as I believe you would not chuse to tell any thing but the truth, you had better tell him, that I am dying as fast as my enemies, if I have any, could wish, and as easily and cheerfully as my best friends could desire." Colonel Edmondstone soon afterwards came to see him, and take leave of him; and on his way home, he could not forbear writing him a letter bidding him once more an eternal adieu, and applying to him, as to a dying man, the beautiful French verses in which the Abbe Chaulieu, in expectation of his own death, laments his approaching separation from his friend, the Marquis de la Fare. Mr. Hume's magnanimity and firmness were such, that his most affectionate friends knew, that they hazarded nothing in talking or writing to him as to a dying man, and that so far from being hurt by this frankness, he was rather pleased and flattered by it. l happened to come into his room while he was reading this letter, which he had just received, and which he immediately showed me. I told him, that though I was sensible how very much he was weakened, and that appearances were in many respects very bad, yet his cheerfulness was still so great, the spirit of life seemed still to be so very strong in him, that I could not help entertaining some faint hopes. He answered, "Your hopes are groundless. An habitual diarrhoea of more than a year's standing, would be a very bad disease at any age: at my age it is a mortal one. When I lie down in the evening, l feel myself weaker than when I rose in the morning; and when I rise in the morning, weaker than when I lay down in the evening. I am sensible, besides, that some of my vital parts are affected, so that I must soon die." "Well," said I, "if it must be so you have at least the satisfaction of leaving all your friends, your brother's family in particular, in great prosperity." He said that he felt that satisfaction so sensibly, that when he was reading a few days before, Lucian's Dialogues of the Dead, among all the excuses which are alleged to Charon for not entering readily into his boat he could not find one that fitted him; he had no house to finish, he had no daughter to provide for, he had no enemies upon whom he wished to revenge himself. "I could not well imagine," said he, "what excuse I could make to Charon in order to obtain a little delay. I have done every thing of consequence which I ever meant to do, and I could at no time expect to leave my relations and

friends in a better situation than that in which I am now likely to leave them; I, therefore, have all reason to die contented." He then diverted himself with inventing several jocular excuses, which he supposed he might make to Charon, and with imagining the very surly answers which it might suit the character of Charon to return to them. "Upon further consideration" said he, "I thought I might say to him, 'Good Charon, I have been correcting my works for a new edition. Allow me a little time, that I may see how the Public receives the alterations.' But Charon would answer, 'When you have seen the effect af these, you will be for making other alterations. There will be no end of such excuses; so, honest friend, please step into the boat.' But I might still urge, 'Have a little patience, good Charon, I have been endeavouring to open the eyes of the public. If I live a few years longer, I may have the satisfaction of seeing the downfal of some of the prevailing systems of superstition.' But Charon would then lose all temper and decency. 'You loitering rogue, that will not happen these many hundred years. Do you fancy I will grant you a lease for so long a term? Get into the boat this instant, you lazy loitering rogue.'"

But, though Mr. Hume always talked Of his approaching dissolution with great cheerfulness, he never affected to make any parade of his magnanimity. He never mentioned the subject but when the conversation naturally led to it, and never dwelt longer upon it than the course of the conversation happened to require: it was a subject indeed which occurred pretty frequently, in consequence of the inquiries which his friends, who came to see him, naturally made concerning the state of his health. The conversation which I mentioned above, and which passed on Thursday the 8th of August, was the last, except one, that I ever had with him. He had now become so very weak, that the company of his most intimate friends fatigued him; for his cheerfulness was still so great, his complaisance and social disposition were still so entire, that when any friend was with him, he could not help talking more, and with greater exertion, than suited the weakness of his body. At his own desire, therefore, I agreed to leave Edinburgh, where I was staying partly upon his account, and returned to my mother's house here, at Kirkaldy, upon condition that he would send for me whenever he wished to see me; the physician who saw him most frequently, Doctor Black, undertaking, in the mean time, to write me occasionally an account of the state of his health.

On the 22nd of August, the Doctor wrote me the following letter:

"Since my last, Mr. Hume has passed his time pretty easily, but is much weaker. He sits up, goes down stairs once a day, and amuses himself with reading, but seldom sees any body. He finds that even the conversation of his most intimate friends fatigues and oppresses him; and it is happy that he does not need it, for he is quite free from anxiety, impatience, or low spirits, and passes his time very well with the assistance of amusing books."

I received the day after a letter from Mr. Hume himself, of which the following is an extract.

Edinburgh, 23rd august, 1776.

"My Dearest Friend,

"I am obliged to make use of my nephew's hand in writing to you, as I do not rise to-day....

"I go very fast to decline, and last night had a small fever, which I hoped might put a quicker period to this tedious illness, but unluckily it has, in a great measure, gone off. I cannot submit to your coming over here on my account, as it is possible for me to see you so small a part of the day, but Doctor Black can better inform you concerning the degree of strength which may from time to time remain with me.

Adieu, &c."

Three days after I received the following letter from Doctor Black.

Edinburgh, Monday, 26th August, 1776.

"Dear Sir,

"Yesterday about four o'clock afternoon, Mr. Hume expired. The near approach of his death became evident in the night between Thursday and Friday, when his disease became excessive, and soon weakened him so much, that he could no longer rise out of his bed. He continued to the last perfectly sensible, and free from much pain or feelings of distress. He never dropped the smallest expression of impatience; but when he had occasion to speak to the people about him, always did it with affection and tenderness. I thought it improper to write to bring you over, especially as I heard that he had dictated a letter to you desiring you not to come. When he became very weak, it cost him an effort to speak, and he died in such a happy composure of mind, that nothing could exceed it."

Thus died our most excellent, and never to be forgotten friend; concerning whose philosophical opinions men will, no doubt, judge variously, every one approving, or condemning them, according as they happen to coincide or disagree with his own; but concerning whose character and conduct there can scarce be a difference of opinion. His temper, indeed, seemed to be more happily balanced, if I may be allowed such an expression, than that perhaps of any other man I have ever known. Even in the lowest state of his fortune, his great and necessary frugality never hindered him from exercising, upon proper occasions, acts both of charity and generosity. It was a frugality founded, not upon avarice, but upon the love of independency. The extreme gentleness of his nature never weakened either the firmness of his mind, or the steadiness of his resolutions. His constant pleasantry was the genuine effusion of good-nature and good humour, tempered with delicacy and modesty, and without even the slightest tincture of malignity, so frequently the disagreeable source of what is called wit in other men. It never was the meaning of his raillery to mortify; and therefore, far from offending, it seldom failed to please and delight, even those who were the objects of it. To his friends, who were frequently the objects of it, there was not perhaps any one of all his great and amiable qualities, which contributed more to endear his conversation. And that gaiety of temper, so agreeable in society, but which is so often accompanied with frivolous and superficial qualities, was in him certainly attended with the most severe application, the most extensive learning, the greatest depth of thought, and a capacity in every respect the most comprehensive. Upon the whole, I have always considered him, both in his lifetime and since his death, as approaching as nearly to the idea of a perfectly wise and virtuous man, as perhaps the nature of human frailty will permit.

I ever am, dear Sir,

Most affectionately your's,

ADAM SMITH.

EDITORIAL CONVENTIONS: letters between slashes (e.g., HUME) designate small capitalization. Letters within angled brackets (e.g., *Hume*) designate italics. Note references are contained within square brackets (e.g., [1]). Original pagination is contained within curly brackets (e.g., {1}). Spelling and punctuation have not been modernized. Printer's errors have been corrected without note. Bracketed comments within the end notes are the editor's. This is a working draft. Please report errors to James Fieser (jfieser@utm.edu).]

Supplement To The Life Of David Hume, Esq.

S.J. Pratt

1777

Editor's note: S.J. Pratt (1749-1814) wrote three works pertaining to the life of Hume: the *Supplement* (1777), *An apology for the life and writings of David Hume* (1777), and *Curious particulars and genuine anecdotes respecting the late Lord Chesterfield and David Hume, esq* (1788). Review journals did not enthusiastically receive the *Supplement* because of its lack of new information. *The Gentleman's Magazine* notes that "little new is to be found in these meagre pages" except for a three anecdotes (1777, Vol. 57, p. 338). *The Monthly Review*'s complete review is that "We observe nothing very material in this publication" (1777, Vol. 57, p. 482), and the complete review in *The London Review* is "Containing a copy of Mr. Hume's will, with a few anecdotes of no material consequence" (1777, Vol. 5, p. 529). Nevertheless, for the modern reader, the *Supplement* is of interest, especially for its graphic account of the events surrounding Hume's funeral. Pratt's *Supplement* was reprinted in 1789; the following is from the 1777 edition.

SUPPLEMENT

TO THE

LIFE

OF

DAVID HUME, ESQ.

CONTAINING

GENUINE ANECDOTES,

AND A CIRCUMSTANTIAL ACCOUNT
OF HIS

DEATH AND FUNERAL.

TO WHICH IS ADDED,

A CERTIFIED COPY OF HIS LAST WILL AND TESTAMENT.

{4}

It is requested of Printers of News-Papers, to be cautious of injuring the Proprietor of this little Performance.

{5}

THERE can be no stronger proof of the high estimation in which Mr. Hume was held, and of his being considered {6} as an extraordinary character, than the eager, yet perhaps, idle curiosity, which the public entertained to learn the most minute circumstances respecting his exit.

As sincere admirers of Mr. Hume, in the Historian, the Philosopher, and the Man; we felt much regret in hearing announced to the public, "The Life of David Hume Esq; written by Himself." It is {7} an undertaking which we hesitate not to pronounce impossible to be executed with propriety: egotism is disgusting; vanity intolerable; and a just estimation of one's self, the most difficult thing in life.

Upon reading this performance, however, which has been dished out into a pamphlet, we find that it only incurs a general charge of insipidity, perhaps in some articles of injustice. Mr. Hume's natural temper {8} disposed him to feel, with exquisite sensibility, every thing which affected his literary fame; and, notwithstanding his boasted equanimity, philosophy did not shield him from the excessive chagrin which he felt from those arrows, which envy and Prejudice darted at his reputation. Anxiety about his difference with the whimsical Rousseau extracted from him a personal, but complete justification. The illiberal criticisms {9} which Mr. Gray[2] threw out against him, in his Epistolary {10} Correspondence, gave him much concern. He saw, with mortification, {11} the laurel wreath which Oxford weaved to cover the bald reputation of Beattie, *his antagonist, not his rival*. And such was the antipathy that subsisted between him and Mr. Tyler, the author of the Vindication of Mary Queen of Scots; that not satisfied with a most acrimonious note,[3] which {12} he has published in the last edition of his History, he would {13} not even sit in company with him, and the appearance of the one effected the instantaneous withdrawing of the other.{14}

Mr. Hume, in the History of his Life, has not informed us of his having stood candidate for the Professorship of Moral Philosophy, in the University of Edinburgh; of the opposition which the

Scots clergy excited to his pretensions; nor of the enquiry which was moved for in the venerable assembly of the Church of Scotland, respecting the principles inculcated in his Writings; and of the censures proposed {15} to be inflicted on him as the author of Heretical Doctrines.

He has observed in the nineteenth page of his Life, that his History of Great Britain met at first with an indifferent reception. But with respect to this, Mr. Hume himself was mistaken. The first edition of the History of Great Britain, for the reigns of James the First and Charles the First, was printed at Edinburgh, A.D. {16} 1754, for *Hamilton, Balfour and Neil*. Hamilton, upon his expectations from this book, took a shop, and settled in London. He applied to the London booksellers to take copies of the History from him, but none of them would deal with an *interloper*. Hamilton, sadly distressed, has recourse to *his friend*, Mr. Millar; Millar *obliges him* by taking fifty copies: but when gentlemen, in his well-frequented shop, asked for the book, "Pho (says Millar {17} generously) "it is incomplete, another volume is coming out soon. You are welcome to the use of this in the mean time." Thus did Millar circulate the fifty copies among some hundred readers, without selling one, And by this ingenious device attained his favourite purpose, of getting Hamilton to sell him his right in the copy for a trifle, as being an insignificant performance. {18}

Mr. Hume, and the late Reverend Dr. Jardine, one of the ministers of Edinburgh, lived in habits of much intimacy. Religion, *natural* and *revealed*, was frequently the subject of their conversation. It happened one night, after they had entertained themselves with theological controversy, that Mr. Hume's politeness, when bidding adieu, would not permit Dr. Jardine (whose oeconomy was not incumbered with many domestics) to light him {19} down stairs. Mr. Hume stumbled in the dark, and the Doctor hearing it, ran to his assistance with a candle, and when he had recovered his guest said to him "David, I have often told you not to rely too much upon yourself, and that *natural light* is not *sufficient*." This pleasantry Mr. Hume never relished.

As a proof of the steadiness of Mr. Hume's sceptical tenets it may be observed, that when he {20} published the first volume of his History of Great Britain, he was advised, that the opinions he had delivered concerning matters of religion, would hurt the sale of his work; and that some apology would be proper. He accordingly in his second volume, P. 449, when speaking of the religious parties, subjoins the following note, which when his fame was established beyond the reach of party, he cancelled as unworthy of admission. {21}

This sophism, of arguing from the abuse of any thing against the use of it, is one of the grossest, and at the same time, the most common, to which men are subject. The history of all ages, and none more than that of the period, which is our subject, offers us examples of the abuse of religion; and we have not been sparing, in this volume more than in the former, to remark them: But whoever would thence draw {22} an inference to the disadvantage of religion in general, would argue very rashly and erroneously. The proper office of religion is to reform mens lives, to purify their hearts, to inforce all moral duties, and to secure obedience to the laws and civil magistrate. While it pursues these salutary purposes, its operations, tho' infinitely valuable, are secret and silent, and seldom come under the cognizance of history. That {23} adulterate species of it alone, which inflames faction, animates sedition, and prompts rebellion, distinguishes itself on the open theatre of the world, and is the great source of revolutions and public convulsions. The historian, therefore, has scarce occasion to mention any other kind of religion; and he may retain the highest regard for true piety, even while he exposes all the abuses of the false. He may even think, that he {24} cannot better show his attachment to the former than by detecting the latter, and laying open its absurdities and pernicious tendency.

It is no proof of irreligion in an historian, that he remarks some fault or imperfection in each sect of religion, which he has occasion to mention. Every institution, however divine, which is adopted by men, must partake of the weakness and infirmities {25} of our nature; and will be apt, unless carefully guarded, to degenerate into one extreme or the other. What species of devotion so pure, noble, and worthy the Supreme Being, as that which is most spiritual, simple, unadorned, and which partakes nothing either of the senses or imagination? Yet is it found by experience, that this mode of worship does very naturally, among the vulgar, mount up into {26} extravagance and fanaticism. Even many of the first reformers are exposed to this reproach; and their zeal, though in the event, it proved extremely useful, partook strongly of the enthusiastic genius: Two of the judges in the reign of Charles the Second, scrupled not to advance this opinion even from the bench. Some mixture of ceremony, pomp, and ornament may seem to correct the abuse; yet will it be {27} found very difficult to prevent such a form of religion from sinking sometimes into superstition. The church of England itself, which is perhaps the best medium among these extremes, will be allowed, at least during the age of archbishop Laud, to have been somewhat infected with a superstition, resembling the Popish; and to have payed a higher regard to some positive institutions, than the nature of the things, strictly {28} speaking, would permit. It is the business of an historian to remark these abuses of all kinds; but it belongs also to a prudent reader to confine the representations, which he meets with, to that age alone of which the author treats. What absurdity, for instance, to suppose, that the Presbyterians, Independants, Anabaptists, and other sectaries of the present age partake of all the extravagancies, which we remark in those, who bore {29} these appellations in the last century? The inference indeed seems juster; where sects have been noted for fanaticism during one period, to conclude, that they will be very moderate and reasonable in the subsequent. For as it is the nature of fanaticism to abolish all slavish submission to priestly power, it follows, that as soon as the first ferment is abated, men are naturally in such sects left to the free use of their reason, {30} and shake off the fetters of custom and authority.

To say barely, that Mr. Hume in his moral character was unexceptionable, would be doing him injustice; he was truly amiable, gentle, hospitable, humane. His temper was cast in the happiest mold, if we may not except to his anxious and extreme sensibility, in every thing which affected his literary reputation. It is told, that an elderly woman in the suburbs of Edinburgh, {31} whose excess of zeal was proportionable to her want of sense and discretion, called on Mr. Hume; declaimed violently against his sceptical principles, as she had learned them by report; represented, that he was nodding on the brink of everlasting destruction; and delivered an earnest prayer, that it would please divine grace to give him to *see* the error of his ways. Mr. Hume listened to her with attention and good humour, thanked the lady {32} for her concern about his future welfare, and expressed a desire to know what was her line in life. She informed him, that she was a married woman, and that her husband was a tallow-chandler in the neighbourhood; upon which Mr. Hume replied, "Good woman, since you have expressed so earnest a desire that I should be inspired with *inward light*, I beg you will supply me with *outward light* also." The matron retired, not a little satisfied with the commission {33} which he gave her, and her husband thenceforwards supplied Mr. Hume's family with candles.

Notwithstanding the ideas which zealots may have formed of Mr. Hume's principles, as latitudanarian, as atheistical, as damnable: his brother's notions of them were very different. For, speaking of the Historian one day, he expressed himself in this manner, "My brother Davie is {34} a good enough sort of a man, *but rather narrow minded*.

As to Mr. Hume's abilities as a Philosopher, and an Historian, his Works are the basis on which

posterity will rear his everlasting fame.

A few months before his death, Mr. Hume was persuaded by his friends to try the effects of a long journey, and the Bath waters: but finding his malady to increase, he resigned all hopes of life. He {35} maintained, however, his usual chearfulness; and being resolved to make the most of the short remained of his lease, he wrote to his friends in Edinburgh, informing them of his resolution to be in that city by a certain day, which he named; and separately requested their company to dinner on the day following. Accordingly, Lord Elibank, Professor Ferguson, Mr. Home the Dramatic Poet, Dr. Smith, Dr. Blair, Dr. Black, and others of his literary {36} friends obeyed the summons, and took a sort of farewel dinner with their dying friend. His *flowery* rival in historic fame was also invited. But, alas! the Lord Advocate of Scotland invites this *Reverend Doctor* on that very day to a turtle feast. What was to be done? both invitations could not be embraced; -- the contest was short: For as it would seem, this Historian's taste is almost as elegant in eating, as in writing, he judiciously preferred {37} the *turtle* of my Lord Advocate to the *mutton* of David Hume.

Never did death make more regular and visible approaches than to Mr. Hume. He met these with a chearfulness and resignation, which could only be the result of a vigorous understanding, and a well-spent life. He still went abroad, called upon his friends, but as the fatigue of a chaise was now become intolerable, he went in {38} a sedan chair, and his ghastly looks bore the most striking appearances of speedy death. His situation was the more uncomfortable, that in his weak emaciated state, the physicians prescribed to him instead of a down bed, to lie on a rugged pallet.[4] {39}

He had already settled his affairs, and his facetiousness still suggested to him to make some verbal legacies, which would not have been so suitable to the gravity of a solemn deed. His friend Mr. Home the Poet, affected a delicacy which abhorred even the taste of Port wine; this whimsical nicety had often been the subject of Mr. Hume's raillery, and he left verbally to his friend the poet, *one bottle* of Port, and ten dozen of Claret, but on this condition, that the {40} poet should drink the Port at two sittings, before he tasted the Claret.

Such was the estimation in which Mr. Hume was held, from his amiable qualities as a citizen, as well as from his literary fame, that for some weeks before his death, his situation become the universal topick of conversation and enquiry; each individual expression an anxious solicitude about his health, as {41} if he had been his intimate and particular friend.

On the twenty-fifth of August, Mr. Hume's character was put beyond the reach of being sullied by human frailty.5 As soon as he conceived himself to be in a dying way, he purchased a spot for the depositing of his {42} ashes; the south-west corner of the Calton burying ground at Edinburgh, *a rock wherein never man had been laid*. And from the particular charge he gave about his corpse, it would seem he was not altogether devoid of apprehensions of its being treated with insult.

The anxious attention with which the public viewed every circumstance respecting Mr. Hume's illness was not terminated even by his death. From the {43} busy curiosity of the mob, one would have presumed them to entertain notions that the ashes of Mr. Hume were to have been the cause or the object of miraculous exertion. As the physicians of London and Edinburgh were divided about the seat of his disorder, those of the city where he died, proposed that his body should be opened: but this, his brother who was also his executor, agreeably to the orders of the deceased, would not permit. {44}

It is hardly to be credited, that the grave-diggers, digging with pick-axes Mr. Hume's grave, should have attracted the gaping curiosity of the multitude. That, notwithstanding a heavy rain, which fell

during the interment, multitudes of all ranks gazed at the funeral procession,[6] as if they {45} had expected the hearse to have been consumed in livid flames, or encircled with a ray of glory; that people in a sphere much above the rabble would have sent to the sexton for the keys of the burying-ground, and paid him to have access to visit the grave. And that on a Sunday evening (the gates of the burying-ground being opened for another funeral) the company, from a public walk in the neighbourhood, flocked in such crouds to Mr. Hume's {46} grave, that his brother actually became apprehensive upon the unusual concourse, and ordered the grave to be railed in with all expedition.

After his interment, two trusty persons, watched the grave for about eight nights. The watch was set by eight at night; at which time a pistol was fired, and so continued to be every hour till day-light. Candles in a lanthorn were placed upon the grave, where they burned all {47} night; and the grease which dropped in renewing or snuffing the candles was to be seen upon the grave afterwards.

We cannot conclude this Supplement to the Life of Mr. Hume more properly than by applying to him and to his Works, those nervous lines, which Ovid has applied to himself.

> **Quod nec Jovis ira, nec ignis,**
> **Nec poterit ferrum, nec edax abolere vetustas.**
> **Cum volet illa dies, quae nil nisi corporis hujus {48}**
> **Jus habet, incerti spatium mihi finiat aevi:**
> **Parte tamen meliore mei super alta perennis**
> **Astra ferar: NOMENQUE ERIT INDELEBILE NOSTRUM.**
> **Quaque patet domitis; Romana potentia terris;**
> **Ore lega populi: PERQUE OMNIA SECULA FAMA**
> **(SI QUID HABENT VERI VATUM PREAESAGIA) VIVAM.**

OVID {49}

CERTIFIED COPY
OF THE
LAST WILL AND TESTAMENT OF
DAVID HUME, ESQ.

{50}{51}

COPY

> **I DAVID HUME, second lawful son of Joseph Home, of Ninewells, Advocate, for the love and affection I bear to John Home, of Ninewells, my brother, and for other causes, Do, by these presents, under the reservations and burthens after mentioned, Give and Dispone to the said John Home, or, if he die before me, to {52} David Home, his second son, his heirs and assignies whatsomever, all lands, heritages, debts and sums of money, as well heritable as moveable, which shall belong to me at the time of my decease, as also my whole effects in general, real and personal, with and under the burthen of the following legacies, *viz*. To my sister, Katherine Home, the sum of Twelve hundred pounds sterling, payable the first term of Whitsunday, or Martinmas, after my decease, together {53} with all my English books, and the live-rent of my house in**

St. James's Court, or in case that house be sold at the time of my decease, Twenty pounds a year during the whole course of her life: To my friend, Adam Ferguson, Professor of Moral Philosophy in the College of Edinburgh, Two hundred pounds sterling: to my friend M. Dalembert, Member of the French Academy, and of the Academy of Sciences in Paris, Two hundred pounds: To my friend, Dr. Adam Smith, {54} late Professor of Moral Philosophy in Glasgow, I leave all my manuscripts without exception, desiring him to publish *my Dialogues on Natural Religion*, which are comprehended in this present bequest, but to publish no other papers which he suspects not to have been written within these five years, but to destroy them all at his leisure: And I even leave him full power over all my papers, except the Dialogues above mentioned: And though I can trust to that intimate and sincere {55} friendship, which has ever subsisted between us, for his faithful execution of this part of my Will, yet, as a small recompence of his pains in correcting and publishing this work, I leave him Two hundred pounds, to be paid immediately after the publication of it: I also leave to Mrs. Anne and Mrs. Janet Hepburn, daughters of Mr. James Hepburn, of Keigh, One hundred pounds a piece: To my cousin, David Campbell, son of Mr. Campbell, Minister of Lillysleaf, One hundred {56} pounds: To the Infirmary of Edinburgh, Fifty pounds: To all the servants who shall be in my family at the time of my decease, one year's wages; and to my housekeeper, Margaret Irvine, three years wages: And I also ordain, that my brother, or nephew, or executor, whoever he be, shall not pay up to the said Margaret Irvine, without her own consent, any sum of money which I shall owe her at the time of my decease, whether by bill, bond, or for wages, but shall retain it in his hand, {57} and pay her the legal interest upon it, till she demand the principal: And in case my brother above mentioned shall survive me, I leave to his son, David, the sum of a Thousand pounds to assist him in his education: But in case that by my brother's death before me, the succession of my estate and effects shall devolve to the aforesaid David, I hereby burthen him, over and above the payment of the aforesaid legacies, with the payment of the sums following: To his brothers, Joseph and {58} John, a Thousand pounds a piece: To his sisters, Catherine and Agnes, Five hundred pounds a piece: All which sums, as well as every sum contained in the present disposition (except that to Dr. Smith) to be payable the first term of Whitsunday, and Martinmas, after my decease; and all of them without exception, in sterling money. And I do hereby nominate and appoint the said John Home, my brother, and failing of him by decease, the said David Home, to be {59} my sole executor and universal legatee, with and under the burthens above mention; Reserving always full power and liberty to me at any time in my life, even in death-bed, to alter and innovate these presents, in whole or in part, and to burthen the same with such other legacies as I shall think fit. And I do hereby declare these presents to be a good, valid, and sufficient evident, albeit found in my custody, or in the custody of any other person, at the time of my death: CONSENTING {60} to the registration hereof in the books of council and session, or other judges books competent therein to remain for preservation, and thereto I constitute Mr. David Rae, Advocate, my procurator.

In witness whereof these presents, consisting of this and the preceding page, are written and subscribed by me on this Fourth of January, One thousand seven hundred and seventy-six at

Edinburgh, before these witnesses, the Right Honourable the Earl of Home, and {61} Mr. John M'Gowan, clerk to the signet.

(Signed) DAVID HUME.

HOME, witness;

JO. M'GOUAN, witness.

Day and date as above.

I also Ordain, That if I shall die any where in Scotland, I shall be buried in a private manner in the Calton church-yard, the south side of it, and a monument be built over my body, at an expence not exceeding a hundred pounds, with an {62} inscription containing only my name, with the year of my birth and death, leaving it to posterity to add the rest.

(Signed), DAVID HUME.

At Edinburgh,

15th April, 1776

I also leave, for rebuilding the bridge of Chirnside, the sum of a hundred pounds; but on condition that the managers of the bridge shall take none of the stones for building the bridge from the quarry of Ninewells, except from that part of the quarry which has {63} been already opened. I leave to my nephew, Joseph, the sum of Fifty pounds to enable him to make a good sufficient drain and sewer round the house of Ninewells, but on condition that if the drain and sewer be not made, from whatever cause, within a year after my death, the said Fifty pounds shall be paid to the poor of the parish of Chirnside: To my sister, instead of all my English books, I leave her a hundred volumes at her choice: To David {64} Waite, servant to my brother, I leave the sum of Ten pounds, payable the first term after my death.

(Signed) DAVID HUME.

In this place of the original Will there are several lines deleted, after which follow these words:

This last clause was erased, and obliterated by myself.

(Signed) DAVID HUME. FINIS

Notes

EDITORIAL CONVENTIONS: letters between slashes (e.g., HUME) designate small capitalization. Letters within angled brackets (e.g., *Hume*) designate italics. Note references are contained within square brackets (e.g., [1]). Original pagination is contained within curly brackets (e.g., {1}). Spelling and punctuation have not been modernized. Printer's errors have been corrected without note. Bracketed comments within the end notes are the editor's. This is a

working draft. Please report errors to James Fieser (jfieser@utm.edu).]

[2]Perhaps the mercenary Mason is more deserving of this censure than Mr. Gray. In order to swell his volume, and to fill his pockets, the former has published a loose and desultory Correspondence, which the latter never dremt would see the light, and would have reprobated could he ever have conceived the idea of his worst papers being put to the ungenerous and ungrateful use. -- Nevertheless, in return to a benefactor, who conferred essential favours upon him, Mr. Mason has, as far as he was able, sacrificed his patron's reputation at the sordid alter of Plutus. The posthumous Poetical Pieces of Mr. Gray, though infinitely valuable, are few in number, and were not likely to answer the interested purposes of the hungry Editor by much emolument. This gentleman, therefore, resolving to establish a literary property or estate, by the name and writings of another, which he honestly acquaints us he was unable to perform by his own, has given to the world, with little labour, a large but meagre Quarto, containing some puerile letters, superior, however, to the Editor's notes, with which they are garnished. And by entitling these "The Poems of Mr. Gray," led the public to buy up a large impression before the deception was discovered. Thus has the ingenuous Mason bartered the high poetical and literary reputation of a worthy man who confided in him, for *money*.

Quid non mortalia pectora coges, Auri facra fames?

[3]This note deserves a place, as it will show that even Mr. Hume himself could occasionally be guilty of, 'the illiberal arrogance, petulance and scurrility which distinguish the Warburtonian School.'

But there is a person, that has writ an 'Enquiry historical and critical into the evidence against Mary Queen of Scots;' and has attempted to refute the forgoing narrative. He quotes a single passage of the narrative in which Mary is said simply to refuse answering; and then a single passage from Goodall, in which she boasts simply that she will answer; and he very civilly and almost directly calls the author a liar, on account of this pretended contradiction. That whole Enquiry, from beginning to end, is composed of such *scandalous artifices* And from this instance, the reader may judge of the *candour, fair dealing, veracity*, and *good manners* of the Enquirer. There are, indeed, three events in our history, which may be regarded as touchstones of partymen. An English Whig, who asserts the reality of the popish Plot, an Irish Catholic, who denies the massacre in 1641, and a Scotch Jacobite, who maintains the innocence of Queen Mary, must be considered as men beyond the reach of argument or reason, and must be left to their prejudices.

[4]His disease was a diarrhoea; the physicians were divided about the seat of the malady. There is a reason however to conjecture, that his disorder originated from a course of eating rather fully, without drinking in proportion.

[5]Mr. Hume, after his circumstances became affluent, lived very hospitably and genteely. Yet he left to his relations upwards of 10,000l. of his own acquiring. He had a pension from the government of 500l. per annum.

[6]When the mob were assembled round Mr. Hume's door to see the corpse taken out to interment, the following short dialogue passed between two of the refuse of the rabble: "Ah, (says one) he was an Atheist." "No matter, (says another) he was an *honest man*.

A Letter to Adam Smith, LL.D. on the Life, Death, and Philosophy of his friend David Hume, Esq.

George Horne

1777

Editor's note: George Horne (1730-1792) was Dean of Canterbury, President of Magdalene College, and Bishop of Norwich. Horne published two anonymous attack on Hume: *A Letter to Adam Smith on the Life, Death, and Philosophy of his friend David Hume* in 1777, and *Letters on Infidelity* in 1784 (see Hume Archives edition). In his *Letter to Adam Smith*, Horne criticizes Smith's glowing portrayal of Hume in the *Letter from Adam Smith to William Strahan*. It is inconsistent, Horne suggests, to praise Hume as a virtuous man in view of Hume's atheistic writings. Horne also takes Smith to task for relaying Hume's unconcern about his approaching death, especially in the playful dialog between Hume and Charon. A postscript to *Letters on Infidelity* contains a summary of Hume's philosophical views taken from James Beattie's *Essay on the Immutability of Truth* (p. 160 ff.). The *Critical Review* comments favorably that the *Letter to Adam Smith* "abounds with strokes of humour, and with the most happy allusions to the peculiar tenets, and circumstances of the philosopher, or to the conduct of his encomiast" (1777 Vol. 43, pp. 306-308). The *London Review* leaves to "the advocates of Mr. Hume and his philosophy to determine whether or not this letter-writer has here stated the case as it really is, in justification of the sarcastical severity which pervades the whole of this little performance" (1777, Vol. 5, pp. 316-317). Because of the ridiculing tone of the *Letter to Adam Smith*, the *Monthly Review* is yet more restrained in its applause:

> **This Author, who is said to be a dignitary of Oxford, labours by alternate and oddly mingled efforts of serious and ludicrous arguments, to convince Dr. Smith, and all the world, that David Hume as, at once, an absurd philosopher, and a pernicious writer. And this being the case, it follows, that the said Dr. Smith, the celebrated author of the *Theory of Moral Sentiments*, and the treatise on *the Wealth of Nations*, -- the friend and panegyrist of the said Hume, -- cannot, himself, be much wiser and**

> better than he should be.... [Hume's and Smith's] Drollery, in such circumstances, is neither more nor less than -- Moody madness, laughing wild, Amid severest woe. -- May not this censure be, in some measure, applied to our Author himself, who affects to *sport*, as he does in some parts of his letter, with a subject the most *serious*! the most *aweful*! -- and of the *last importance* to every rational being! [1777, Vol. 56, p. 403]

Horne's *Letter to Adam Smith* is directly assaulted in a "Reply" by S.J. Pratt, appended to his 1777 *Apology for the Life and Writings of David Hume* (pp. 129-167). Pratt writes "your *leer* is by no means *civil*, and you *do* sneer yourself most horribly, even while you are teaching *others* to sneer.... The questions you address to Dr. Smith, are, most of them, exceedingly superficial.... Your arguments, Sir, are not much happier than your questions; as your remarks are in general, poorer than both." Painting a more memorable image of Horne's pamphlet, in his *Memoirs of the Life of Dr. Horne* (1799) William Jones writes that,

> The Letter to Dr. Adam Smith, like the Essay of Dr. Beattie, has a great deal of truth, recommended by a great deal of wit; and if the reader has not seen it, he has some pleasure in store. We allow to the memory of Dr. Adam Smith, that he was a person of understanding and diligent research, in things relating merely to this world... but when he set up Mr. Hume as a pattern of perfection, and judged of all religion by the principles of that philosopher, he was very much out of his line.

The *Letter to Adam Smith* was published a second time in 1777, and several more times in 1784, 1786 (prefaced to *Letters on Infidelity*), 1799, 1804, 1813, 1820, and 1830 (in *The Works of George Horne*. The following is from the 1779 edition.

A
LETTER
TO
ADAM SMITH. LL.D.
ON THE
LIFE, DEATH, AND PHILOSOPHY
OF HIS FRIEND
DAVID HUME. ESQ.
BY ONE OF THE PEOPLE CALLED CHRISTIANS.

N.B. ***The Author of this Tract was GEORGE HORNE, D.D. Late Lord Bishop of Norwich*.**

{iii}

ADVERTISEMENT.

IT is of no consequence, gentle Reader, to you, any more than it is to Dr. SMITH, that you should know the name of the person, who now addresseth you. Your mind cannot be biassed, either way, by that, of which you remain ignorant. The remarks in the following pages are not therefore true, or false, because I made them; but I made them, because I thought them to be true. Read, consider, and determine for yourself. If you find no satisfaction, throw the book into the fire; regret (but with moderation, as becometh a philosopher) the loss of your sixpence;[2] and take care not to lose another, in the same manner. If, on the contrary, you *should* find satisfaction (and, it is humbly hoped, you will find a great deal) neglect not to communicate to others, what his thus been communicated to you. Speak handsomely of me, wherever you go, and introduce me to your kinsfolk and acquaintance. The enemies of Religion are awake; let not her friends sleep.

I intend a much longer work; but, like the learned editor of Mr. HUME'S Life, am necessitated to "gratify," with all possible expedition, "the impatience of the public curiosity;" so eager is it to hear, what they, who believe in GOD, can possibly have to say for themselves. And if this will do the business, why should you be troubled with more? I am far from agreeing with Mr. VOLTAIRE, in all his observations. But there is one, in which it is impossible to disagree with him. "I have said, and I abide by it," cries the little hero, "that the fault of most books is, their being too large." On reviewing what I have written, I really cannot see there is occasion to add another sentence.

Had I not chosen, for reasons best known to myself, thus to make my appearance *incog*. I would certainly have sate for my picture, and have tried to cast a look at my title page, as lively and good humoured, as that of Mr. Hume himself. My bookseller, indeed, told me, it would have been a much more creditable way of doing the thing; "and then, you know, Sir," said he, "we could have charged the other sixpence."

A

LETTER, &C.

SIR,

YOU have been lately employed in embalming a philosopher; his *body*, I believe I must say; for concerning the other part of him, neither you nor he seem to have entertained an idea, sleeping or waking. Else, it surely might have claimed a little of your care and attention; and one would think, the belief of the soul's existence and immortality could do no harm, if it did no good, in a *Theory of Moral Sentiments*. But every gentleman understands his own business best.

Will you do an unknown correspondent the honour, Sir, to accept a few plain remarks, in a free and easy way, upon the curious letter to Mr. STRAHAN, in which this ever memorable operation of *embalming* is performed? Our Philosopher's account of *his own life* will likewise be considered, as we go along.

Trust me, good Doctor, I am no bigot, enthusiast, or enemy to human learning -- *Et ego in Arcadia*

-- I have made many a hearty meal, in private, upon CICERO and VIRGIL, as well as Mr. HUME.[3] Few persons (though, perhaps, as Mr. HUME says, upon a like occasion, "I ought not to judge on that subject") have a quicker relish for the productions of genius, and the beauties of composition. It is therefore as little in my intention, as it is in my power, to prejudice the literary character of your friend. From some of his writings I have received great pleasure, and have ever esteemed his History of England to have been a noble effort of *matter and motion*. But when a man takes it into his head to do mischief, you must be sensible, Sir, the public has always reason to lament his being a *clever fellow*.

I hope it will not be deemed vanity in me likewise to say, that I have in my composition a large proportion of that, which our inimitable SHAKESPEARE styles, *the mild of human kindness*. I never knew what envy or hatred was; and am ready, at all times, to praise, wherever I can do it, in honour and conscience. DAVID, I doubt not, was, as you affirm, a social agreeable person, of a convivial turn, told a good story, and played well at "his favourite game of whist."[4] I know not that JOHN THE PAINTER did the same. But there is no absurdity in the supposition. If he did not, he might have done it -- Doctor; be not offended -- I mean no harm. I would only infer thus much, that I could not, on that account, bring myself absolutely to approve his odd fancy of firing all the dockyards in the kingdom.

Concerning the *philosophical opinions* of Mr. HUME you observe,[5] that "men will, no doubt, judge variously." They are certainly at liberty so to do, because the author himself did the same. Sometimes, to be sure, he esteemed them ingenious, deep, subtile, elegant, and calculated to diffuse his literary fame to the ends of the world. But, at other times, he judged very differently; very much so, indeed. "I dine," says he, "I play a game at back-gammon, I converse, and am merry with my friends; and when after three or four hours amusement, I would return to these speculations, they appear so *cold*, so *strained*, and so *ridiculous*, that I cannot find in my heart to enter into them any farther."[6] Now, Sir, if you will only give me leave to judge, before dinner, of Mr. HUME'S philosophy, as he judged of it after dinner, we shall have no farther dispute upon that subject. I could indeed wish, if it were possible, to have a scheme of thought, which would bear contemplating, at any time of the day; because, otherwise, a person must be at the expence of maintaining a brace of these metaphysical Hobby-Horses, on to mount in the morning, and the other in the afternoon.

After all, Sir, friend as I am to freedom of opinion (and no one living can be more so) I am rather sorry, methinks, that men should judge so *variously* of Mr. HUME's philosophical speculations. For since the design of them is to banish out of the world every idea of truth and comfort, salvation and immortality, a future state, and the providence, and even existence of GOD, it seems a pity, that we cannot be all of a mid about them, though we might have formerly liked to hear the author crack a joke, over a bottle, in his life time. And I could have been well pleased to have been informed by you, Sir, that, before his death, he had ceased to number among his happy effusions tracts of this kind and tendency.

For -- (let me come a little closer to you, Doctor, if you please, upon this subject -- Don't be under any apprehensions -- my name does not begin with a B___) Are *you* sure, and can you make *us* sure, that there really exist no such things as a GOD, and a future state of rewards and punishments? If so, all is well. Let us *then*, in our last hours, read LUCIAN, and play at WHIST, and droll upon CHARON and his boat;[7] let us die as foolish and insensible, as much like our brother philosophers, the calves of the field, and the asses of the desart, as we can, for the life of us. But -- if such things BE -- as they most certainly ARE -- Is it right in you, Sir, to hold up to our view, as

"perfectly wise and virtuous,"8 the *character* and *conduct* of one who seems to have been possessed with an incurable antipathy to all that is called RELIGION; and who strained every nerve to explode, suppress, and extirpate the spirit of it among men, that it's very name, if he could effect it, might no more be had in remembrance? Are we, do you imagine, to be reconciled to a character of this sort, and fall in live with it, because it's owner was *good company*, and knew how to manage his *cards?* Low as the age is fallen, I will venture to hope, it has grace enough yet left, to resent such usage as this.

You endeavour to entertain us with some *pleasant conceits* that were supposed by Mr. HUME to pass between himself and old CHARON. The philosopher tells the old gentleman, that, "he had been endeavouring to open the eyes of the Public;" that he was "correcting his works for a new edition," from which great things were to be expected; in short, "if he could but live a few years longer (and that was the only reason why he would with to do so), he might have the satisfaction of seeing the downfal of some of the prevailing systems of *superstition*."[9]

We all know, Sir, what the word superstition denotes, in Mr. HUME'S vocabulary, and against what Religion his shafts are levelled, under that name. But, Doctor SMITH, do you believe, or would you have us to believe, that it is CHARON, who calls us out of the world, at the appointed time? Doth not HE call us out of it, who sent us into it? Let me, then, present you with a paraphrase of the Wish, as addressed to HIM, to whom it should, and to whom alone, with any sense and propriety it can be addressed. -- Thus it runs --

"LORD, I have only one reason why I would with to live. Suffer me so to do, I most humbly beseech thee, yet a little while, till mine eyes shall behold the success of my undertaking to overthrow, by my metaphysics, the faith which thy SON descended from heaven to plant, and to root out the knowledge and the love of thee from the earth."

Here are no rhetorical figures, no hyperbole's or exaggerations. The matter is even so. I appeal, in the fact of the world, Sir, to yourself, and to every man, who can read and understand the writings of Mr. HUME, whether this be not, in plain, honest English, the drift of his *philosophy* as it is called; for the propagation of which alone he wished to live; and concerning which you are pleased to say cooly, "men will judge variously, every one approving or condemning these opinions, according as they happen to coincide or disagree with his own."[10] Our thoughts are very naturally carried back, upon this occasion, to the author of the *first philosophy*, who likewise engaged to *open the eyes of the Public* -- He did so; but the only discovery they found themselves able to make, was, -- that they were NAKED.

You talk much, Sir, of our philosopher's *gentleness* of manners, *good nature, compassion, generosity, charity*. Alas, Sir, whither were they all fled, when he so often sate down calmly and deliberately to obliterate from the hearts of the human species every trace of the knowledge of GOD and his dispensations; all faith in his kind providence, and fatherly protection; all hope of enjoying his grace and favour, here, or hereafter; all love of him, and of their brethren for his sake; all the patience under tribulation, all the comforts, in time of sorrow, derived from these fruitful and perennial sources? Did a good man think himself able, by the force of metaphysic incantations, in a moment, to blot the sun out of heaven, and dry up every fountain upon earth, would he attempt to do it? -- TULLY had but a faint glimpse of the country to which we are all travelling; yet, so pleasing was any the most imperfect and shadowy prospect into futurity, that TULLY declared, no man should ravish it from him.[11] And surely, TULLY was a philosopher, as well as HUME. O had he seen the light which shone upon HUME, he would not have closed his eyes

against it; had the same cup been offered to him, he would not have dashed it untasted from him!

"Perhaps our modern sceptics are ignorant, that without the belief of a GOD, and the hope of immortality, the miseries of human life would often be insupportable. But can I suppose them in a state of total and invincible stupidity, utter strangers to the human heart, and to human affairs? Sure, they would not thank me for such a supposition. Yet this I must suppose, or I must believe them to be the most cruel, the most perfidious, and the most profligate of men. Caressed by those who call themselves the great, ingrossed by the formalities of life, intoxicated with vanity, pampered with adulation, dissipated in the tumult of business, or amidst the vicissitudes of folly, they perhaps have little need and little relish for he consolations of religion. But let them know, that in the solitary scenes of life, there is may an honest and tender heart pining with incurable anguish, pierced with the sharpest sting of disappointment, bereft of friends, chilled with poverty, racked with disease, scourged by the oppressor; whom nothing but trust in Providence, and the hope of a future retribution could preserve from the agonies of despair. And do they, with sacrilegious hands, attempt to violate this last refuge of the miserable, and to rob them of the only comfort that had survived the ravages of misfortune, malice, and tyranny? Did it ever happen, that the influence of their execrable tenets disturbed the tranquillity of virtuous retirement, deepened the gloom of human distress, or aggravated the horrors of the grave? Is it possible, that this may have happened in many instances? Is it possible, that this hath happened in one single instance? -- Ye traitors to human kind, ye murderers of the human soul, how can you answer for it to your own hearts! Surely, every spark of your generosity is extinguished for ever, if this consideration do not awaken in you the keenest remorse, and make you with in bitterness of soul -- But I remonstrate in vain. All this must have often occurred to you, and been as often rejected, as utterly frivolous. Could I enforce the present topic by an appeal to your vanity, I might possibly make some impression. But to plead with you on the principles of BENEVOLENCE OR GENEROSITY, is to address you in a language ye do not, or will not understand; and as to the shame of being convicted of absurdity, ignorance, or want of candour, ye have long ago proved yourselves superior to the sense of it. -- But let not the lovers of truth be discouraged. Atheism cannot be of long continuance, nor is there much danger of it's becoming universal. The influence of some conspicuous characters hath brought it too much into fashion; which, in a thoughtless and profligate age, it is no difficult matter to accomplish. But when men have retrieved the powers of serious reflection, they will find it a frightful phantom; and the mind will return gladly and eagerly to it's old endearments. One thing we certainly know; the fashion of sceptical and metaphysical systems passeth away. Those unnatural productions, the vile effusion of a hard and stupid heart, the mistakes it's own restlessness for the activity of genius, and it's own captiousness for sagacity of understanding, may, like other monsters, please awhile by their singularity; but the charm is soon over; and the succeeding age will be astonished to hear, that their fore-fathers were deluded, or amused, with such fooleries."

You, Sir, have read the preceding paragraph before; but this Letter may come into the hands of many, who have not. It is the alarum bell to the admirers of Mr. HUME; and should be rung in their ears, till succeeded by the last trumpet.

And now, Sir, will you give me leave to ask you a few questions? Why all this hurry and bustle, this eagerness to gratify the pretended "impatience of the Public,"[12] and satisfy it, that our philosopher lived and died perfectly composed and easy? Was there, then, any suspicion, in SCOTLAND, that he might not, at times, be quite so composed and easy as he should have been? Was there any particular BOOK ever written against him, that shook his system to pieces about his

ears, and reduced it to a heap of ruins, the success and eclat of which might be supposed to have hurt his ind, and to have affected his health? Was there any AUTHOR, whose *name* his friends never dared to mention before him, and warned all strangers, that were introduced to him, against doing it, because he never failed, when by any accident it was done, to fly out into a transport of passion and swearing?[13] Was it deemed necessary, or expedient, on this account, that he should represent himself, and that you should represent him, to have been perfectly secure of the growth and increase of his philosophic reputation, as if no book had been written, which had impaired it; it having been judged much easier to dissemble the fall of DAGON, than to *set him upon his stumps again?* I am a *South* Briton, and, consequently, not acquainted with what passes so far in the opposite quarter. You, Sir, can inform us how these things are; and likewise, when the great work of *benevolence* and *charity*, of *wisdom* and *virtue*, shall be crowned by the publication of a treatise designed to prove the soul's mortality, and another, to justify and recommend self murder; for which, without doubt, the present and every future age will bless the name of the *gentle* and *amiable* author.

Upon the whole, Doctor, your meaning is good; but I think you will not succeed, this time. You would persuade us, by the example of DAVID HUME, Esp; that atheism is the only cordial for low spirits, and the proper antidote against the fear of death. But, surely, he who can reflect, with complacency, on a friend thus misemploying his talents in his life, and when amusing himself with LUCIAN, WHIST, and CHARON, at his death, may smile over BABYLON in ruins; esteem the earthquake, which destroyed LISBON, an agreeable occurrence; and congratulate the hardened PHARAOH, on his overthrow in the Red sea. Drollery, in such circumstances, is neither more nor less than

Moody Madness, laughing wild,

Amid severest woe. Would we know the baneful and pestilential influences of false philosophy on the human heart? We need only contemplate them in this most deplorable instance of Mr. HUME.

These sayings, Sir, may appear harsh; but they are salutary. And if departed spirits have any knowledge of what is passing upon earth, that person will be regarded by your friend as rendering him the truest services, who, by energy of expression, and warmth of exhortation, shall most contribute to prevent his writings from producing those effects upon mankind, which he no longer wishes they should produce. Let no man deceive himself, or be deceived by others. It is the voice of eternal TRUTH, which crieth aloud, and faith to you, Sir, and to me, and to all the world -- *He that believeth on the Son hath everlasting life; and he that believeth not the Son, shall not see life; but the wrath of God abideth on him*.[14]

By way of contrast to the behaviour of Mr. HUME, at the close of a life, passed *without* GOD *in the world*, permit me, Sir, to lay before yourself, and the Public, the last sentiments of the truly learned, judicious, and admirable HOOKER, who had spent *his* days in the service of his Maker and Redeemer.

After this manner, therefore, spake the author of the *Ecclesiastical Polity*, immediately before he expired --

"I have lived to see, that this world is made up of perturbations; and I have been long preparing to leave it, and gathering comfort for the dreadful hour of making my account with GOD, which I now apprehend to be near. And though I have, by his grace, loved him in my youth, and feared him in mine age, and laboured to have a conscience void of offence, towards him, and towards all men; yet, if thou, Lord shouldest be extreme to mark what I have done amiss, who can abide it?

And therefore, where I have failed, Lord, shew mercy to me; for I plead not my righteousness, but the forgiveness of my unrighteousness, through his merits, who died to purchase pardon for penitent sinners. And since I owe thee a death, Lord, let it not be terrible, and then take thine own time; I submit to it. Let not mine, O Lord, but thy will be done! -- GOD hath heard my daily petitions; for I am at peace with all men, and he is at peace with me. From such blessed assurance I feel that inward joy, which this world can neither give, nor take from me. My conscience beareth me this witness; and this witness makes the thoughts of death joyful. I could wish to live, to do the church more service; but cannot hope it; for my days are past, as a shadow that returns not."

His worthy Biographer adds -- "More he would have spoken, but his spirits failed him; and, after a short conflict between nature and death, a quiet sigh put a period to his last breath, and so, he fell asleep -- And now he seems to rest like Lazarus in Abraham's bosom. Let me here draw his curtain, till, with the most glorious company of the Patriarchs and Apostles, and the most noble army of Marytrs and Confessors, this most learned, most humble, most holy man shall also awake to receive an eternal tranquillity, and with it a greater degree of glory, than common Christians shall be made partakers of."

Doctor SMITH, when the hour of his departure hence shall arrive, will copy the example of the BELIEVER, or the INFIDEL, as it liketh him best. I must freely own, I have no opinion of that reader's *head*, or *heart*, who will not exclaim, as I find myself obliged to do --

> ***Let* ME *die the death of the Righteous, and let* MY *last end be like his!***

POSTSCRIPT.

AS it is possible, Sir, nay probable, that this little tract, because it is a little one, may be perused by many, who have not leisure or inclination to go through large volumes, and yet wish to know what Mr. HUME'S philosophical system is; I shall here subjoin a short, but comprehensive summary of the doctrines which compose it, drawn up, some few years ago, by a learned gentleman, for his amusement, with proper references to those parts of our philosopher's works, where such doctrines were to be found. And though I never heard, the compiler had the thanks of Mr. HUME for doing, yet neither could I ever find, that he or his friends disputed the fidelity and accuracy with which it was done.[15]

A SUMMARY OF MR. HUME'S DOCTRINES, METAPHYSICAL AND MORAL

OF THE SOUL

That the soul of man is not the same this moment, that it was the last; that we know not what it is; that it is not one, but many things; and that it is nothing at all.

That in this soul is the agency of all the causes that operate throughout the sensible creation; and yet that in this soul there is neither power not agency, nor any idea of either.

That matter and motion may often be regarded as the cause of thought.

OF THE UNIVERSE

That the external world does not exist, or at least, that it's existence may reasonably be doubted.

That the universe exists in the mind, and that the mind does not exist.

That the universe is nothing but a heap of perceptions, without a substance.

That though a man could bring himself to believe, yea, and have reason to believe, that every thing in the universe proceeds from some cause; yet it would be unreasonable for him to believe, that the universe itself proceeds from a cause.

OF HUMAN KNOWLEDGE

That the perfection of human knowledge is to doubt.

That we ought to doubt of every thing, yea, of our doubts themselves, and therefore, the utmost that philosophy can do, is to give us a doubtful solution of doubtful doubts.[16]

That the human understanding, acting alone, does entirely subvert itself, and prove by argument, that by argument nothing can be proved.

That man, in all his perceptions, actions, and volitions, is a mere passive machine, and has no separate existence of his own, being entirely mad up of other things, of the existence of which he is by no means certain; and yet, that the nature of all things depends so much upon man, that two and two could not be equal to four, nor fire produce heat nor the sun light, without an act of the human understanding.

OF GOD

That it is unreasonable to believe GOD to be infinitely wise and good, while there is any evil or disorder in the universe.

That we have no good reason to think the universe proceeds from a cause.

That as the existence of the external world is questionable, we are at a loss to find arguments by which we may prove the existence of the Supreme Being, or any of his attributes.

That when we speak of Power, as an attribute of any being, GOD himself not expected, we use words without meaning.

That we can form no idea of power, nor of any being endued with power, *much less* of one endued with infinite power; and that we can never have reason to believe, that any object, or quality of any object exists, of which we can form an idea.[17]

OF THE MORALITY OF HUMAN ACTION

That every human action is necessary, and could not have been different from what it is.

That moral, intellectual, and corporeal virtues are nearly of the same kind -- In other words, that to want honesty, and to want understanding, and to want a leg, are equally the objects of moral disapprobation.

That adultery must be practised, if men would obtain all the advantages of life; that, if generally practised, it would in time cease to be scandalous; and that, if practised secretly and frequently, it would by degrees come to be thought no crime at all.

Lastly, as the soul of man, according to Mr. HUME, becomes every moment a different being, the

consequences must be, that the crimes committed by him at one time, cannot be imputable to him at another.[18]

I believe, Doctor Smith, the reader is now fully prepared to enter into the spirit of your concluding sentence, which therefore shall be mine.

"I have always considered Mr. HUME, both in his life-time, and since his death, as approaching as nearly to the idea of A PERFECTLY WISE AND VIRTUOUS MAN, as perhaps the nature of human frailty will permit."

"David Hume"

Memoirs of the political and private Life of James Caulfield, earl of Charlemont

James Caulfield

a. 1799

Editor's note: James Caulfield, Earl of Charlemont (1728-1799). Caulfield's *Memoirs* are a compilation of letters and notes by Cauflied which are organized and provided with connective narrative by Francis Hardy. The *Quarterly Review* praises this work as a contribution to the history of Ireland: "Not that these 'Memoirs of Lord Charlemont" form a complete history of Ireland during the life of that nobleman... but they afford a very liberal and entertaining contribution towards it; they supply a great deal of important matter which is not to be obtained from any other source...." (1811, Vol. 6, pp. 124-147). The memoirs reproduce two biographical essays written by Caulfield about Hume; they are evidently based on years of qpersonal acquaintance. The original manuscripts currently reside in the Royal Irish Academy (MS 12/R/17, f. 523). The first essay describes Hume's personal appearance, dress, and speech. Hume's philanthropy is praised, and skeptical motives are examined. The second essay relates Rousseau episodes, conversations on immortality, Hume's reception in France, denial of deism, defense of the Stuarts, and inclination to proselytize. The first edition of the *Memoirs* appeared in 1810 with a second (two volume) edition following shortly after in 1812. The following is taken from the 1812 edition (London: T Cadell, Vol. 1, pp. 12-19, 230-239).

The celebrated David Hume, whose character is so deservedly high in the literary world, and whose works, both as a Philosopher and as an Historian, are so wonderfully replete with genius and entertainment, was, when I was at Turin, Secretary to Sir John Sinclair, plenipotentiary from the court of Great Britain to his Sardinian majesty. He had then lately published those philosophical essays which have done so much mischief to mankind, by contributing to loosen the sacred bonds by which alone man can be restrained from rushing to his won destruction, and

which are so intimately necessary to our nature, that a propensity to be bound by them was apparently instilled into the human mind, by the all-wise Creator, as a balance against those passions which, though perhaps necessary as incitements to activity, must, without such controul, inevitably have hurried us to our ruin. The world, however, unconscious of its danger, had greedily swallowed the bait; the essays were received with applause, read with delight, and their admired author was already, by public opinion, placed at the head of the dangerous school of sceptic philosophy.

With this extraordinary man I was intimately acquainted. He had kindly distinguished me from among a number of young men, who where then at the academy, and appeared so warmly attached to me, that it was apparent he not only intended to honour me with his friendship, but to bestow on me what was, in his opinion, the first of all favours and benefits, by making me his convert and disciple.

Nature, I believe, never formed any man more unlike his real character than David Hume. The powers of phisiognomy were baffled by his countenance; neither could the most skilful, in that science, pretend to discover the smallest trace of the faculties of his mind, in the unmeaning features of his visage. His face was broad and fat, his mouth wide, and without any other expression than that of imbecility. His eyes vacant and spiritless, and the corpulence of his whole person was far better fitted to communicate the idea of a turtle-eating Alderman, than of a refined philosopher. His speech, in English, was rendered ridiculous by the broadest Scotch accent, and his French was, if possible, still more laughable; so that wisdom, most certainly, never disguised herself before in so uncouth a garb. Though now near fifty years old, he was healthy and strong; but his health and strength, far from being advantageous to his figure, instead of manly comeliness, had only the appearance of rusticity. His wearing an uniform added greatly to his natural awkwardness, for he wore it like a grocer of the trained bands. Sinclair was a Lieutenant-general, and was sent to the courts of Vienna and Turin, as a military envoy, to see that their quota of troops was furnished by the Austrians and Piedmontese. It was, therefore, thought necessary that his secretary should appear to be an office, and Hume was accordingly disguised in scarlet.

Having thus given an account of his exterior, it is but fair that I should state my good opinion of his character. Of all the philosophers of his sect, none, I believe, ever joined more real benevolence to its mischievous principles than my friend Hume. His lobe of mankind was universal and vehement; and there was no service he would not cheerfully have done to his fellow creatures, excepting only that of suffering them to save their souls in their own way. He was tender-hearted, friendly, and charitable in the extreme, as will appear from a fact, which I have from good authority. When a member of the university of Edinburgh, and in great want of money, having little or no paternal fortune, and the collegiate stipend being very inconsiderable, he had procured, through the interest of some friend, an office in the university, which was worth about forty pounds a year. On the day when he had received this good news, and just when he had got into his possessions the patent, or grant entitling him to his office, he was visited by his friend Blacklock, the poet, who is much better known by his poverty and blindness, than by his genius. This poor man began a long descant on the misery, bewailing his want of sight, his large family of children, and his utter inability to provide for them, or even to procure them the necessaries of life. Hume, unable to bear his complaints, and destitute of money to assist him, ran instantly to his desk, took out the grant, and presented it to his miserable friend, who received it with exultation, and whose name was soon after, by Hume's interest, inserted instead of his own. After such a relation it is needless that I should say any more of his genuine philanthropy, and generous beneficence; but the difficulty will

now occur, how a man, endowed with such qualities could possibly consent to become the agent of so much mischief, as undoubtedly has been done to mankind by his writings; and this difficulty can only be solved by having recourse to that universal passion, which has, I fear, a much more general influence over all our actions than we are willing to confess. Pride, or vanity, joined to a sceptical turn of mind, and to an education which, though learned, rather sipped knowledge than drank it, was, probably, the ultimate cause of this singular phaenomenon; and the desire of being placed at the head of a sect, whose tenets controverted and contradicted all received opinions, was too strong to be resisted by a man, whose genius enabled him to find plausible arguments, sufficient to persuade both himself and many others, that his own opinions were true. A philosophical knight-errant was the dragon he had vowed to vanquish, and he was careless, or thoughtless, of the consequences which might ensue from the achievement of the adventure to which he had pledged himself. -- He once professed himself the admirer of a young, most beautiful, and accomplished lady, at Turin, who only laughed at his passion. One day he addressed her in the usual common-place strain, that he was *abime,* aneanti. -- '*Oh! pour* aneanti,' replied the lady, '*cd n'est en effet qu' une operation tres naturelle de votre Systeme*.'

Nothing ever shewed a mind more truly beneficient than Hume's whole conduct with regard to Rousseau. That story is too well known to be repeated, and exhibits a striking picture of Hume's heart, whilst it displays the strange and unaccountable vanity, and madness, of the French, or rather Swiss moralist. When first they arrived together from France, happening to meet with Hume in the Park, I wished him joy of his pleasing connection, and particularly hinted, that I was convinced he must be perfectly happy in his new friend, as their sentiments were, I believed, nearly similar. 'Why no, man,' said he, 'in that you are mistaken; Rousseau is not what you think him; he has a hankering after the Bible, and, indeed, is little better than a Christian, in a way of his own.' Excess of vanity was the madness of Rousseau. When he first arrived in London, he and his Armenian dress were followed by crowds, and as long as this species of admiration lasted, he was contented and happy. But in London, such sights are only the wonder of the day, and in a very short time he was suffered to walk where he pleased, unattended, unobserved. From that instant, his discontent may be dated. But to dwell no longer on matters of public notoriety, I shall only mention one fact, which I can vouch for truth, and which would. of itself be amply sufficient to convey an adequate idea of the amazing eccentricity of this singular man. When after having quarrelled with Hume, and all his English friends, Rousseau was bent on making his escape, as he termed it, into France, he stopped at a village between London and Dover, and from thence wrote to General Conway, then Secretary of State, informing him, that although he had got so far with safety, he was well apprized, that the remainder of his rout was so beset by his inexorable enemies, that, unprotected, he could not escape. He therefore solemnly claimed the protection of the King, and desired that a party of cavalry might be immediately ordered to escort him to Dover. This letter General Conway shewed to me, together with his answer, in which he assured him that the postillions were, altogether, a very sufficient guard throughout every part of the King's dominions. To return to Hume. In London, where he often did me the honour to communicate the manuscripts of his additional essays, before their publication, I have sometimes, in the course of our intimacy, asked him whether he thought that, if his opinions were universally to take place, mankind would not be rendered more unhappy than they now were; and whether he did not suppose that the curb of religion was necessary to human nature? "The objections,' answered he, "are not without weight; but error never can produce good, and truth ought to take place of all consideration. ' He

never failed, in the midst of any controversy, to give its due praise to every thing tolerable what was either said, or written against him. One day that he visited me in London, he came into my room laughing, and apparently well pleased. 'What has put you into this good humour, Hume?' said I. 'Why, man,' replied he, 'I have just now had the best thing said to me I ever heard. I was complaining in a company, where I spent the morning, that I was very ill treated by the world, and that the censures past upon me were hard and unreasonable. That I had written many volumes, throughout the whole of which there were but few pages that contained any reprehensible matter, and yet, for those few pages, I was abused and torn to pieces.' 'You put me in mind,' said an honest fellow in the company, whose name I did not know, 'of an acquaintance of mine, a notary public, who, having been condemned to be hanged for forgery, lamented the hardship of his case; that after having written many thousand inoffensive sheets, he should be hanged for one line.'

But an unfortunate disposition to doubt of every thing seemed interwoven with the nature of Hume, and never was there, I am convinced, a more thorough and sincere sceptic. He seemed not to be certain even of his own present existence, and could not therefore be expected to entertain any settled opinion respecting his future state. Once I asked him what he thought of the immortality of the soul? 'Why troth, man,' said he, 'it is so pretty and so comfortable a theory, that I wish I could be convinced of its truth, but I canna help doubting.'

Hume's fashion at Paris, when he was there as Sectarary to Lord Hertford, was truly ridiculous; and nothing ever marked, in a more striking manner, the whimsical genius of the French. No man, from his manners, was surely less formed for their society, or less likely to meet with their approbation; but that flimsy philosophy which pervades, and deadens even their most licentious novels, was then the folly of the day. Free thinking and English frocks were the fashion, and the Anglomanie was the *ton du pais*. Lord Holland, though far better calculated than Hume to please in France, was also an instance of this singular predilection. Being about this time on a visit to Paris, the French concluded, that an Englishman of his reputation must be a philosopher, and must be admired. It was customary with him to doze after dinner, and one day, at a great entertainment, he happened to fall asleep; 'Le voila!' says a Marquis, pulling his neighbour by the sleeve; 'Le voila, qui pense!' But the madness for Hume was far more singular and extravagant. From what has been already said of him, it is apparent that his conversation to strangers, and particularly to Frenchmen, could be little delightful, and still more particularly, one would suppose, to French women. And yet no lady's toilette was complete without Hume's attendance. At the opera, his broad, unmeaning face was usually seen *entre deux jolis minois*. The ladies in France give the ton, and the ton was deism; a species of philosophy ill suited to the softer sex, in whose delicate frame weakness is interesting, and timidity a charm. But the women in France were deists, as with us they were charioteers. The tenets of the new philosophy were *a portee de tout, le monde*, and the perusal of a wanton novel, such, for example, as Therese Philosophe, was amply sufficient to render any fine gentleman, or any fine lady, an accomplished, nay, a learned deist. How my friend Hume was able to endure the encounter of these French female Titans I know not. In England, either his philosophic pride, or his conviction that infidelity was ill suited to women, made him perfectly averse from the initiation of ladies into the mysteries of his doctrine. I never saw him so much displeased, or so much disconcerted, as by the petulance of Mrs. Mallet, the conceited wife of Bolingbroke's editor. This lady, who was not acquainted with Hume, meeting him one night at an assembly, boldly accosted him in these words: 'Mr. Hume, give me leave to introduce myself to you; we deists ought to know each other.' -- 'Madame,' replied he, 'I am no deist. I do not style myself so, neither do I desire to be known by that appellation.'

Nothing ever gave Hume more real vexation, than the strictures made upon his history in the House of Lords, buy the great Lord Chatham. Soon after that speech I met Hume, and ironically wished him joy of the high honour that had been done him. 'Zounds, man,' said he, with more peevishness than I had ever seen him express, 'he's a Goth! he's a Vandal!' Indeed, his history is as dangerous in politics, as his essays are in religion; and it is somewhat extraordinary, that the tame man who labours to free the mind from what he supposes religious prejudices, should as zealously endeavour to shackle it with the servile ideas of despotism. But he loved the Stuart family, and his history is, of course, their apology. All his prepossessions, however, could never induce him absolutely to falsify history; and though he endeavours to soften the failings of his favourites, even in their actions, yet it is on the characters which he gives to them, that he principally depends for their vindication; and from hence frequently proceeds, in the course of his history, this singular incongruity, that it is morally impossible that a man, possessed of the character which the historian delineates, should in certain circumstances have acted the part which the same historian narrates and assigns to him. But now to return to his philosophical principles, which certainly constitute the discriminating feature of his character. The practice of combating received opinions, had one unhappy, though not unusual, effect on his mind. He grew fond of paradoxes, which his abilities enabled him successfully to support; and his understanding was so far warped and bent by this unfortunate predilection, that he had well nigh lost that best faculty of the mind, the almost intuitive perception of truth. His sceptical turn made him doubt, and consequently dispute every thing; yet was he a fair and pleasant disputant. He heard with patience, and answered without acrimony. Neither was his conversation at any time offensive, even to his more scrupulous companions: his good sense, and good nature, prevented his saying any thing that was likely to shock, and it was not till he was provoked to argument, that, in mixed companies, he entered into his favourite topics. Where indeed, as was the case with me, his regard for any individual rendered him desirous of making a proselyte, his efforts were great and anxiously incessant.

Respecting this new, or rather revived system of philosophy, *soi disante telle*, it may perhaps be confessed, that it may possibly have done some good; but then it has certainly done much more mischief to mankind. On the one hand, it may perhaps be allowed, that to its prevalence we owe that general system of toleration which seems to prevail, and which is, I fear, the only speck of white that marks the present age. Yet even this solitary virtue, if infidelity be its basis, is founded on a false principle. Christian Charity, which includes the idea of universal philanthropy, and which, when *really Christian*, is the true foundation on which this virtue should be erected, and not the opinion that all religions should be tolerated, because all are alike erroneous. But even allowing this boasted benefit its full weight, to the same cause we are, I doubt, on the other hand, indebted for that profligacy of manners, or, to call it by the most gentle name, that frivolity which every where prevails. To this cause we owe that total disregard, that fastidious dislike to all serious thought; for every man can be a deist without thinking; he is made so at his toilette, and, whilst his hair is dressing, reads himself into an adept; that shameful and degrading apathy to all that is great and noble; in a word, that perfect indifference to right or wrong, which enervates and characterizes this unmeaning and frivolous age. Neither have we reason to hope a favourable change. The present manners are the fashion of the day, and will not last. But infidelity will never subside into true piety. It will produce its contrary. The present is an age of irreligion; the next will, probably, be an age of bigotry.

Anecdotes of David Hume

The Autobiography of Dr. Alexander Carlyle

Alexander Carlyle

a. 1800

Editor's note: Scottish clergyman Alexander Carlyle (1722-1805) began writing his memoirs at the close of his life in 1800. They cover the period from 1722 until 1770, which is as far as Carlyle had reached in the project before his death. Although Carlyle left instructions for the posthumous publication of his memoirs, they first appeared in 1859, edited by John Hill Burton. *The Edinburgh Review* opens its review of the *Autobiography* with the following general appraisal: "This book contains by far the most vivid picture of Scottish life and manners that has been given to the public since the days of Sir Walter Scott... The term autobiography scarcely describes if correctly. A far more accurate notion of its contents would have been conveyed, had the editor adhered to that which Dr. Carlyle himself seems from the opening sentence to have contemplated -- viz., 'Anecdotes and Characters of the Times.'" Regarding Carlyle's account of Hume, the *Edinburgh* notes that "...one of the greater lights of Edinburgh in those days, was unquestionably David Hume. In many respects Carlyle presents Hume in a new and a more pleasing light than that in which the world has hitherto seen him. His sketches of him are of special importance, proceeding, as they do, not only from an intimate friend, but from one whose own sincerity as a Christian believer was never called in question" (1861, Vol. 113). The Burton edition of Carlyle's *Autobiography* was republished in 1860, 1861 and 1910. A new edition of Carlyle's memoirs edited by James Kinsley, appeared in 1972 based on Carlyle's original manuscript. The following is from the 1910 edition (London: T.N. Foulis).

At this time David Hume was living in Edinburgh and composing his *History of Great Britain*. He was a man of great knowledge, and of a social and benevolent temper, and truly the best-natured man in the world. He was branded with the title of Atheist, on account of the many attacks on revealed religion that are to be found in his philosophical works, and in many places of his History

-- the last of which are still more objectionable than the first, which a friendly critic might call only sceptical. Apropos of this, when Mr. Robert Adam, the celebrated architect, and his brother, lived in Edinburgh with their mother, an aunt of Dr. Robertson's, and a very respectable woman, she said to her son, "I shall be glad to see any of your companions to dinner, but I hope you will never bring the Atheist here to disturb my peace." But Robert soon fell on a method to reconcile her to him, for he introduced him under another name, or concealed it carefully from her. When the company parted she said to her son, "I must confess that you bring very agreeable companions about you, but the large jolly man who sat next me is the most agreeable of them all." "This was the very Atheist," said he, "mother, that you was so much afraid of." "Well," says she, "you may bring him here as much as you please, for he's the most innocent, agreeable, facetious man I ever met with." This was truly the case with him; for though he had much learning and a fine taste, and was professedly a sceptic, though by no means an atheist, he had the greatest simplicity of mind and manners with the utmost facility and benevolence of temper of any man I ever knew. His conversation was truly irresistible, for while it was enlightened, it was naive almost to puerility.

I was one of those who never believed that David Hume's sceptical principles had laid fast hold on his mind, but thought that his books proceeded rather from affectation of superiority and pride of understanding and love of vainglory. I was confirmed in this opinion, after his death, by what the Honourable Patrick Boyle, one of his most intimate friends, told me many years ago at my house in Musselburgh, where he used to come and dine the first Sunday of every General Assembly, after his brother, Lord Glasgow, ceased to be Lord High Commissioner. When we were talking of David, Mrs. Carlyle asked Mr. Boyle if he thought David Hume was as great an unbeliever as the world took him to be? He answered, that the world judged from his books, as they had a right to; but he thought otherwise, who had known him all his life, and mentioned the following incident: When David and he were both in London, at the period when David's mother died, Mr. Boyle, hearing of it, soon after went into his apartment -- for they lodged in the same house -- when he found him in the deepest affliction and in a flood of tears. After the usual topics of condolence. Mr. Boyle said to him, "My friend, you owe this uncommon grief to your having thrown off the principles of religion; for if you had not, you would have been consoled by the firm belief that the good lady, who was not only the best of mothers, but the most pious of Christians, was now completely happy in the realms of the just." To which David replied, "Though I threw out my speculations to entertain and employ the learned and metaphysical world, yet in other things I don not think so differently from the rest of mankind as you may imagine." To this my wife was a witness. This conversation took place the year after David died, when Dr. Hill, who was to preach, had gone to a room to look over his notes.

At this period, when he first lived in Edinburgh, and was writing his *History of England*, his circumstances were narrow, and he accepted the office of Librarian to the Faculty of Advocates, worth L40 per annum. But it was not for the salary that he accepted this employment, but that he might have easy access to the books in that celebrated library; for to my certain knowledge, he gave every farthing of the salary to families in distress. Of a piece with this temper was his curiosity and credulity, which were without bounds, a specimen of which shall be afterwards given when I come down to Militia and the Poker. His economy was strict, as he loved independency; and yet he was able at that time to give suppers to his friends in his small lodging in the Canongate. He took much to the company of the younger clergy, not from a wish to bring them over to his opinions, for he never attempted to overturn any man's principles, but they best understood his notions, and could furnish him with literary conversation. Robertson and John Home and

Bannatine and I lived all in the country, and came only periodically to the town. Blair and Jardine both lived in it, and suppers being the only fashionable meal at that time, we dined where we best could, and by cadies assembled our friends to meet us in a tavern by nine o'clock; and a fie time it was when we could collect David Hume, Adam Smith, Adam Ferguson, Lord Elibank, and Drs. Blair and Jardine, on an hour's warning. I remember one night that David Hume, who, having dined abroad, came rather late to us, and directly pulled a large key from his pocket, which he laid on the table. This he said was given him by his maid Peggy (much more like a man than a woman) that she might not sit up for him, for she said when the honest fellows came in from the country, he never returned home till after one o'clock. This intimacy of the young clergy with David Hume enraged the zealots on the opposite side, who little know how impossible it was for him, had he been willing, to shake their principles.

As Mr. Hume's circumstances improved he enlarged his mode of living, and instead of the roasted hen and minced collops, and a bottle of punch, he gave both elegant dinners and suppers, and the best claret, and, which was best of all, he furnished the entertainment with the most instructive and pleasing conversation, for he assembled whosoever were most knowing and agreeable among either the laity or clergy. This he always did, but still more unsparingly when he became what he called rich. For innocent mirth and agreeable raillery I never know his match. Jardine, who sometimes bore hard upon him -- for he had much drollery and wit, though but little learning -- never could overturn his temper. Lord Elibank resembled David in his talent for collecting agreeable companions together, and had a house in town for several winters chiefly for that purpose.

David, who delighted in what the French call *plaisanterie*, with the aid of Miss Nancy Ord, one of the Chief Baron's daughters, contrived and executed one that gave him very great delight. As the New Town was making its progress westward, he built a house in the south-west corner of St. Andrew Square. The street leading south to Princes Street had not yet got its name affixed, but they got a workman early one morning to paint on the corner stone of David's house "St. David's Street," where it remains to this day.

He was at first quite delighted with Ossian's poems, and gloried in them; but on going to London he went over to the other side, and loudly affirmed them to be inventions of Macpherson. I happened to say one day, when he was declaiming against Macpherson, that I had met with nobody of his opinion but William Caddel of Cockenzie, and President Dundas, which he took ill, and was some time of forgetting. This is one instance of what Smellie says of him, that though of the best temper in the world, yet he could be touched by opposition or rudeness. This was the only time I had ever observed David's temper change. I can call to mind an instance or two of his good-natured pleasantry. Being at Gilmerton, where David Hume was on a visit, Sir David Kinloch made him go to Athlestaneford Church, where I preached for John Home. When we met before dinner, "What did you mean," says he to me, "by treating John's congregation to-day with one of Cicero's academics? I did not think that such heathen morality would have passed in East Lothian. On Monday, when we were assembling to breakfast, David retired to the end of the dining-room, when Sir David entered: "What are you doing there, Davy? come to your breakfast." "Take away the enemy first," says David. The baronet, thinking it was the warm fire that kept David in the lower end of the room, rung the bell for a servant to carry some of it off It was not the fire that scared David, but a large Bible that was left on a stand at the upper end of the room, a chapter of which had been read at the family prayers the night before, that good custom not being then out of use when clergymen were in the house. Add to this John Home saying to him at the Poker Club, when everybody wondered what could have made a clerk of Sir William Forbes run away with

L900 -- "I know that very well," says John Home to David; "for when he was taken, there was found in his pocked your *Philosophical Works* and Boston's *Fourfold State of Man*."

David Hume, during all his life, had written the most pleasing and agreeable letters to his friends. I have preserved two of these. But I lately saw tow of more early date in the hands of Mr. Sandiland Dysart, W.S., to his mother, who was a friend of David's and a very accomplished woman, one of them dated in 1751, on occasion of his brother Hume of Ninewell's marriage; and the other in 1754, with a present of the first volume of the History, both of which are written in a vein o pleasantry and playfulness which nothing can exceed, and which makes me think that a collection of his letters would be a valuable present to the world, and present throughout a very pleasing picture of his mind.

I have heard him say that Baron Montesquieu, when he asked him if he did not think that there would soon be a revolution in France favourable to liberty, answered, "No, for their noblesse had all become poltroons." He said that the club in Paris (Baron Holbach's) to which he belonged, were of opinion that Christianity would be abolished in Europe by the end of the eighteenth century; and that they laughed at Andrew Stuart for making a battle in favour of a future state, and called him "L'ame Immortelle."

David Hume, like Smith, had no discernment at all of characters. The only two clergymen whose interests he espoused, and for one of whom he provided, were the two silliest fellows in the Church. With every opportunity, he was ridiculously shy of asking favours, on account of preserving his independence, which always appeared to me to be a very foolish kind of pride. His friend John Home, with not more benevolence, but with no scruples from a wish of independence, for which he was not born, availed himself of his influence and provided for hundreds, and yet he never asked anything for himself.

"The Life of David Hume, Esq."

William Smellie

from

Literary and Characteristical Lives

1800

Editor's Introduction: William Smellie (1740-1795) was a Scottish printer, naturalist and antiquarian. From 1765 until his death, Smellie owned a printing business with various partners and was instrumental in publishing the first edition of the *Encyclopedia Britannica*. From 1773 through 1776 Smellie and Gilbert Stuart edited "The Edinburgh Magazine and Review," a monthly periodical. Near the close of his life, Smellie planned to write a biographical dictionary of famous Scottish authors with whom he was personally acquainted. Unfortunately, he was only able to completed sketches of John Gregory, Henry Home, David Hume, and Adam Smith. These were published posthumously by his son Alexander Smellie in 1800 under the title *Literary and characteristical lives of John Gregory, M.D., Henry Home, lord Kames, David Hume, esq. and Adam Smith, L.L.D. To which are added A dissertation on public spirit; and three essays* (Edinburgh). The lengthy essay on Hume (pp. 149-209) draws heavily from previously published sources, such as from Hume's *Life* and personal letters, Smith's *Letter*, and Smellie's *Encyclopedia Britannica* entry on "abridgement" (which discusses Hume). Flattering personal comments and anecdotes are interspersed. Smellie's biographical essays were not well received by the review journals of the day. The *Monthly Review* criticizes that Smellie's collection of biographies "would have communicated greater interest, had the author imparted particulars calculated to afford a more accurate view of their private conduct, opinions, and tempers, than can be collected from a perusal of their writings, or the public events of their lives, which are already sufficiently known" (1800, Vol. 33, pp. 422-423). The *New London Review* echoes the *Monthly*'s general assessment, and notes that "The life of Hume contains no new fact, nor any important anecdote beyond what we are already in possession of from his own account of it" (1800, Vol. 3, pp. 162-163). The *European Magazine* writes that "if the present lives were intended as specimens of the intention and execution [of

Smellie's planned biographical dictionary], the public will not much regret that the design is left to other hands." The review continues, however, noting that the account of Hume "is the most entertaining in the volume, but the greater part of it has appeared before, which is indeed acknowledged" (1800, Vol. 37, pp. 448-449). In spite of these negative comments, Smellie's essay is a significant contribution to Hume biography particularly because of the eye-witness anecdotes presented at the close of his essay. The following is from the 1800 and only printed edition of *Literary and Characteristical Lives*.

{149}

THE
LIFE
of
DAVID HUME, ESQ.

IT is an arduous task to give an impartial account of an author who has been the object of so much praise and of so much obloquy as Mr. Hume: Yet the attempt must be made.

Mr. Hume was born at Edinburgh in the 26th of April 1711, old style. He was descended of respectable families both on the father and mother's side. His father's family was a branch of the earl of Hume's and his mother was a daughter of sir David Falconer. president if the College of Justice. {150} His family, however, was not opulent; and he being a younger brother , his patrimony was of course, very trifling. His father died when Mr. Hume was an infant: and he along with a sister an elder brother, were left to the care of their mother, who devoted her whole attention to the rearing and educations of her children.. Mr Hume passed through the ordinary courses of education with great success and very early discovered an uncommon passion for literature. This last circumstance suggested to his friends the idea that the profession of the law would be a proper employment for him; but young Hume had an insuperable aversion to everything but the pursuits of philosophy and of general learning; he tells us, that, when he was supposed to be studying Voet and Vinnius, Cicero and Virgil were the authors he was secretly devouring.

This plan, however, his narrow fortune was unable to support. He, therefore, made attempt to enter upon a more active scene of life. With this view, in the {151} year 1734, he went to Bristol, and had recommendations to some of the most eminent merchants in that city. In a few months, he discovered that this species of business was irksome and disagreeable to him. In order to prosecute his studies with the greater success, as well as to enable him to live upon his small fortune, he went to a country retreat. His chief residence was at La Fleche, in Anjou, where he composed his *Treatise of Human Nature*, which, after returning to London, he published in the year 1739. "Never literary attempt," Mr Hume remarks, "was more unfortunate than my Treatise of Human Nature. It fell *dead-born from the press*, without reaching such distinction as even to excite a murmur among the *zealots*.[2]"

This complaint is curious, and confirms the adage, that an author is the worst judge of the merit or

demerit of his own works. Mr Hume's *Treatise of Human Nature,* as he himself informs us, excited no attention, either of praise or of censure, {152} from the public. No wonder! When much younger, I read that book with great ardour, and with great application. Some parts of it I perceived to be both ingenious and brilliant, and others so involved in obscurity, that I found it impossible to comprehend the meaning. At the period of life, I naturally attributed this seeming obscurity to my own inability, and was often ashamed, for that reason, to acknowledge that I had read it, because I could not give any distinct account of the book. When older, I perused it a second time, and then perceived an ingenious literary *trick,* if I may use such an expression. Mr Hume, when he begins an essay, or turns the *corner* of any argument, most artfully lays down a seemingly simple position, to which almost every reader gives a ready assent. From that moment, however, the reader is most completely bewildered: For, whenever these plausible positions are admitted, or inadvertently passed over, such is the force of Mr Hume's reasonings, and such the beauty and energy of his eloquence, that no reader can resist the torrent. Dean {153} Swift says, that the best way to conquer a woman, is to catch her by the *tail*. But the only successful mode of conquering Mr Hume is to catch him by the *nose*.

In the year 1742, Mr Hume published at Edinburgh the first part of the Essays. This work met with a more favourable reception from the public, and gave him some consolation for his former disappointment. In 1745, he was invited by the Marquis of Annandale, who was then indisposed both in mind and in body, to come and live with him in England, where Mr Hume continued during twelve months; and, by his appointments in that station, was enabled to make a considerable addition to his small fortune. He then received an invitation from General St Clair to attend him as secretary to an expedition against Canada, but which ended in an incursion on the coast of France. In 1747, Mr Hume was again invited by General St Clair to attend him in the same station in his embassy to the courts of Vienna and Turin. He then wore the uniform of an officer; and, in the character of aid-de-camp {154} to the General, was introduced into these courts. These two years, he tells us, were almost the only interruptions he met with to his studies during the course of his life. But he passed them agreeably; and his appointments, joined to his own frugality, soon enabled him to amass near a thousand pounds.

Mr. Hume imagined that his *Treatise of Human Nature* had failed of success more from the manner of writing than from the matter. He, therefore, to use his own expression, *cast* the first part of that work anew in his *Inquiry concerning Human Understanding,* which was published while he was at Turin. But, at first, this piece was not much more successful than the former. Mr. Hume, however, though he must have felt those disappointments, was not altogether discouraged. In the 1749, he came down from London to Scotland, and lived at his brother's country-house, where he composed the second part of his Essay, which he called *Political Discourses,* and likewise his *Inquiry concerning the Principles of Morals,* {155} which, he tells us, in another part of his *Treatise,* that he *cast* anew. Soon afterwards, he was informed by Mr A. Millar, his London bookseller, that his former publications, except his unfortunate Treatise, were beginning to be the subject of conversation; that the sale of them was gradually increasing; and that new editions were become necessary to answer the demands of the public. "Answers," he archly remarks, "by Reverands and Right Reverands, came out two or three in a year; and I found, by *Dr. Warburton's railing,* that the books were beginning to be esteemed in *good company*."[3]

Mr Hume, in the year 1751, removed from the country, and came to Edinburgh, which he emphatically terms the *true scene for a man of letters*.[4] In 1752, he published his *Political Discourses,* the first work of his which was successful at the outset. In the same year appeared his

Inquiry concerning the Principles of Morals, "which is," says he, "of all my writings, historical, {156} philosophical, or literary, incomparably the best."[5] But the public were of a contrary opinion; for the book was either totally neglected, or treated with contempt.

In the same year, he was appointed by the Faculty of Advocates their Librarian, from which office he received only a trifling emolument; but it gave him the command of a great collection of books and manuscripts. When this Library falls naturally to be mentioned, it would be unpardonable not to tell a truth of which every man of letters in Edinburgh has daily experience. The collection, especially of printed books, exceeds greatly that of any library in Britain; and free access to the perusal of them is cheerfully and politely allowed. On this subject, I must go farther. The occasional use of books or manuscripts in a public library is a most valuable privilege. The Faculty of Advocates, however, not only grants this privilege, but any member of that Faculty can, by his signature, oblige his friends with such books as {157} he chuses out of doors for a reasonable time; and such requests, on all proper occasions, are most liberally granted. The Faculty do more. Literary gentlemen, by giving bond for a certain sum, often acquire the privilege of taking out books upon their own receipts. To this noble collection, joined to the generosity of its proprietors, Scotland, for these hundred years past, has been indebted for the many productions of genius and of learning which have enabled her sons, within that period, to make such a distinguished figure in almost every department of science. I must not, however, omit her powerful auxiliaries. The libraries of the University of Edinburgh, and of the College of Physicians, are very great, and particularly enriched with books of Medicine, of Anatomy, and of Natural History. The access to these libraries is equally easy as to that of the Faculty of Advocates. But, to return. -- In this most favourable situation, where he had an opportunity of consulting almost every authentic resource, Mr Hume formed the plan of writing the *History of England*. {158} He commenced with the accession of the House of Stuart, and afterwards observed a kind of retrograde motion. Of the success of this work, he acknowledges his expectations were sanguine. "But," says he,

> "miserable was my disappointment: I was assailed by one cry of reproach, disapprobation, and every detestation; English, Scotch, and Irish, Whig and Tory, Churchman and Sectary, Freethinker and Religionist, Patriot and Courtier, united in their rage against the man who had presumed to shed a generous tear for the fate of Charles I. and the Earl of Strafford; and, after the ebullitions of their fury were over, what was still more mortifying, the book seemed to sink into oblivion."[6]

Some time afterwards, he published at London his *Natural History of Religion*.

> "Its public entry," he remarks, "was rather obscure, except only that Dr. Hurd wrote a pamphlet against it, with all the illiberal petulance, arrogance, and scurrility, {159} which distinguish the Warburtonian school. This pamphlet gave me some consolation for the otherwise indifferent reception of my performance."[7]

Two years after the miscarriage of the first volume, viz. in 1756, he published the second volume of his History of England, which included the period from the death of Charles I. to the Revolution. This performance gave less umbrage to the Whigs, and was more favourably received by the public. "It not only rose itself," says he, but helped to buoy up its unfortunate brother."[8] In the year 1759, Mr Hume published his *History of the House of Tudor*. The clamour excited by this work was nearly equal to that against the History of the two first Stuarts. The reign of Elizabeth was particularly offensive. "But," he tells us,

> "I was now callous against the impressions of public folly, and continued very

> peaceably and contentedly in my retreat at Edinburgh, to finish, in two volumes, the more early period of the English History, {160} which I gave to the public in 1761, with tolerable, and but tolerable, success."[9]

Notwithstanding, however, a very general clamour and many rude attacks, Mr Hume's writings gradually acquired ore and more reputation; and he received from the booksellers higher copy-money than had been given to any other author in Britain before that period. He now found himself not only independent, but opulent; and, therefore, he retired to his native country of Scotland, with a design never to leave it again. At that time, he was turned of fifty years, when, in the year 1763, he received an invitation from the Earl of Hertford to attend him on his embassy to Paris, with a near prospect of being his secretary. This offer, however, Mr Hume at first declined, on account of his age, and the reluctance he felt against mingling again with the gay company of the French metropolis. But, upon his Lordship's repeating the invitation, Mr. Hume at last consented. He was afterwards appointed secretary to the {161} embassy. In summer 1765, Lord Hertford was called home to be Lord Lieutenant of Ireland, and Mr Hume was left *charge d' affaires* till the arrival of the Duke of Richmond about the end of the same year. In the beginning of the year 1766, Mr Hume left Paris, and next summer went to Edinburgh with the view of enjoying an agreeable retreat among philosophical friends, with which that city, though not large, peculiarly abounds. Mr. Amyat, King's Chymist, a most sensible and agreeable English gentleman, resided in Edinburgh for a year or two. He one day surprised me with a curious remark. There is not a city in Europe, said he, that enjoys such a singular and such a noble privilege. I asked, What is that privilege? He replied, here I stand at what is called the *cross of Edinburgh*, and can, in a few minutes, take fifty men of genius and learning by the hand. The fact is well known; but to a native of that city, who has all his days been familiarized with it, and who has not travelled into other countries, that circumstance, though very remarkable, passes unnoticed: {162} Upon strangers, however, it makes a deep impression. In London, in Paris, and other large cities of Europe, though they contain many literary men, the access to them is difficult; and, even after that is obtained, the conversation is, for some time, shy and constrained. In Edinburgh, the access to men of parts is not only easy, but their conversation and the communication of their knowledge are at once imparted to intelligent strangers with the utmost liberty. The philosophers of Scotland have no nostrums. They tell what they know, and deliver their sentiments without disguise or reserve. This generous feature was conspicuous in the character of Mr Hume. He insulted no man; but, when the conversation turned upon particular subjects, whether moral or religious, he expressed his genuine sentiments with freedom, with force, and with a dignity which did honour to human nature.

In the year 1767, Mr Hume was invited by Mr. Conway to be under Secretary, which both the character of the person, and {163} his connections with Lord Hertford, prevented him from declining. He returned to Edinburgh in 1769 very opulent; for he then possessed a revenue of 1000L. a year; and, though pretty far advanced in life, he was in good health, and had the prospect of long enjoying ease, and seeing the increase of his reputation.

In sprint 1775, he began to be afflicted with a disorder in his bowels, which at first did not alarm him; but he soon afterwards apprehended that a mortification, and of course, a speedy dissolution, were to ensue. Still, however, his cheerfulness and usual alacrity, notwithstanding the great decline of his body, did not desert him. He considered, that a man of sixty-five, by dying, cuts off only a few years of infirmities, and perhaps of peevishness and anxiety. Mr Hume concludes his life with a short sketch of what he apprehended to be his own character and dispositions: "I am, or rather was," says he,

> "a man of mild disposition, of command of temper, of an open, social, and cheerful humour, capable {164} of attachment, but little susceptible of enmity, and of great moderation in all my passions. Even my love of literary fame, my ruling passion, never soured my temper, notwithstanding my frequent disappointments. My company was not unacceptable to the young and careless, as well as to the studious and literary; and, as I took a particular pleasure in the company of modest women, I had no reason to be displeased with the reception I met with from them."[10]

Though Mr Hume believed the disease which afflicted him was to carry him off the stage of life, as we are informed by a letter from the late most ingenious and excellent Dr. Adam Smith to William Strahan, Esq; (of the latter of whom he had such a favourable opinion, that he left him the charge, with discretionary powers, of all his manuscripts, some of which, and particularly that of his own life, were afterwards published;) yet he was prevailed upon, by the entreaties of his friends, to try what might be the effects of a long journey. He accordingly, about the end of {165} April 1776, set out for London; and when he came the length of Morpeth, he met with Dr Adam Smith, and Mr John Home,[11] a gentleman well known for his poetical genius, and particularly for his theatrical writings. These two gentlemen were on their road from London expecting to find Mr Hume at Edinburgh. Mr Home returned with him, and "attended him," Mr Smith tells us, "during the whole of his stay in England, with that care and attention which might be expected from a temper so perfectly friendly and affectionate."[12]

Mr Hume's disease seemed to yield a little to exercise and change of air; for, when he arrived in London, he was apparently in much better health than when he left Edinburgh. He was advised to go to Bath and drink the waters, which, for some time, had so good an effect upon him, that he began to have some hopes of recovering his health. His former symptoms, however, {166} returned with their usual violence. From that moment, he relinquished all hopes of the continuation of life, and of ease. But he submitted to his fate with the utmost cheerfulness and complacency. When he returned to Edinburgh, though he found himself much weaker, his spirits never failed him. His cheerfulness was so great, and his conversation and amusements continued to much in their accustomed strain, that, notwithstanding many bad symptoms, few of his friends could believe his dissolution to be so fast approaching. Doctor Dundas, when taking leave of Mr Hume one day, said to him, "I shall tell your friend Colonel Edmonstone, that I left you much better, and in a fair way of recovery." -- "Doctor, Mr Hume replied, "as I believe you would not chuse to tell any thing but the truth, you had better tell him, that I am dying as fast as my enemies, if I have any, could wish, and as easily and cheerfully as my best friends could desire."[13]

Soon afterwards, Colonel Edmonstone went to see Mr Hume, and to take a last {167} farewell of him. But, on his way home, he could not refrain from writing a letter, bidding him once more an eternal adieu. Such were Mr Hume's magnanimity and fortitude of mind, that his most intimate and affectionate friends knew they hazarded no offence in taking or writing to him as a dying man. Mr Adam Smith happened to call upon Mr Hume when he was reading Colonel Edmonstone's letter, which he immediately showed to Mr Smith. After perusing this letter, Mr Smith remarked, that appearances were against Mr Hume; still, however, he said, your cheerfulness is so great, and you spirit of life so strong, that I must entertain some faint hopes of your recovery. Mr Hume answered, "Your hopes are groundless. An habitual *diarheoa*, of more than a year's standing, would b e a very bad disease at any age. At my age, it is a mortal one. When I lie down in the evening, I feel myself weaker than when I rose in the morning; and, when I rise in the morning, weaker than when I lay down in the evening. I am sensible, besides, that some of my vital parts are

affected, {168} so that I must soon die."14 Mr Smith replied, "If it must be so, you have at least the satisfaction of leaving all your friends, your brother's family in particular, in great prosperity."15 Mr Hume said, he felt that satisfaction so sensibly, that, a few days before, when reading Lucian's Dialogues of the Dead, among all the excuses which are usually made to Charon by souls who are backward to be ferried in his boat over the river Styx, he could not find one that suited him. He had no house to furnish, no children to provide for, nor any enemies upon whom he wished to be revenged. "I could not well imagine," said he, "what excuse I could make to Charon, in order to obtain a little delay. I have done every thing of consequence which I ever meant to do, and I could at no time expect to leave my relations and friends in a better situation than that in which I am now likely to leave them: I, therefore, have all reason to die contented."

He then amused himself with inventing {169} some whimsical excuses, which he supposed he might make to Charon, and with imagining the surly answers which it might suit the character of Charon to return to them. "Upon further consideration," said he, "I thought I might say to him, Good Charon, I have been correcting my works for a new edition. Allow me a little time that I may see how the public receives the alterations." But charon would answer, "When you have seen the effect of these, you will be for making other alterations. there will be no end of such excuses; so, honest friend, please step into the boat." But Mr Hume said, I might still urge, "Have a little patience, good Charon, I have been endeavouring to open the eyes of the public. If I live a few years longer, I may have the satisfaction of seeing the downfal of some of the prevailing systems of superstition." But Charon would then lose all temper and decency. -- "You loitering rogue, that will not happen these many hundred years. Do you fancy I will grant you a lease for so long a term? Get into the boat this instant, you lazy loitering rogue."16 {170}

Though Mr Hume frequently talked of his approaching dissolution with great ease, he never affected to make a parade of his magnanimity. He never mentioned the subject but when the conversation naturally suggested it. Mr Hume had now become so weak, that the company of his most intimate companions fatigued him; for his cheerfulness was still so great, his complaisance and social disposition were still so entire, the, when any friend was with him, he could not refrain from talking more, and with greater exertion, than the weakness of his body could easily sustain. Mr Smith, therefore, agreed, at Mr Hume's desire, to leave Edinburgh, and go to live in Kirkcaldy with his mother, who then resided in that town. The ingenious and well known Dr. Black, professor of chymistry in the university of Edinburgh, undertook occasionally to write Mr Smith an account of the state of his friend's health. Accordingly, on the 22d day of August, Dr Black wrote Mr Smith the following letter: "Since my last, Mr Hume has passed his time pretty easily, but is much weaker. He sits up, {171} goes down stairs once a-day, and amuses himself with reading, but seldom sees any body. He finds, that even the conversation of his most intimate friends fatigues and oppresses him; and it is happy that he does not need it, for he is quite free from anxiety, impatience, or low spirits, and passes his time very well with the assistance of amusing books."

The next day, Mr Smith received a letter from Mr Hume himself, of which what follows is an extract.

"*My deareast friend, Edin.* Aug. 23. 1776.

I am obliged to make use of my nephew's hand in writing to you, as I don not rise to-day. I go very fast to decline, and last night had a small fever, which I *hoped* might put a *quicker period* to this tedious illness, but unluckily it has, in a great measure, gone off." Three days after, Mr Smith received the following letter from Dr Black. {172}

"Dear sir, *Edin. Aug.* 26. 1776.

Yesterday, about four o'clock afternoon, Mr Hume expired. the near approach of his death became evident in the night between Thursday and Friday, when his disease became excessive, and soon weakened him so much, that he could no longer rise out of his bed. He continued to the last perfectly sensible, and free from much pain or feeling of distress. He never dropped the smallest expression of impatience; but, when he had occasion to speak to the people about him, always did it with affection and tenderness I thought it improper to write to bring you over, especially as I heard that he had dictated a letter to you, desiring you not to come. -- When he became very weak, it cost him an effort to speak, and he died in such a happy composure of mind, that nothing could exceed it." "Thus died," says Mr Smith, in his letter to Mr Strahan,

> "our most excellent and never to be forgotten friend, concerning whose philosophical opinions men will no doubt judge variously, every one approving, {173} proving, or condemning them, according as they happen to coincide or disagree with his own; but concerning whose character and conduct there can scarce be a difference of opinion. His temper, indeed, seemed to be more happily balance, if I may be allowed such an expression, than that, perhaps, of any other man I have ever known. Even in the lowest state of his fortune, his great and necessary frugality never hindered him, on proper occasions, from exercising acts both of charity and generosity. It was a frugality founded no upon avarice, but upon the love of independency. The extreme gentleness of his nature never weakened either the firmness of his mind, or the steadiness of his resolutions. His constant pleasantry was the genuine effusion of good nature and good humour, tempered with delicacy and modesty; and without even the slightest tincture of malignity, so frequently the disagreeable source of what is called wit in other men. It never was the meaning of his raillery to mortify; and, therefore, far from offending, it seldom failed to please and delight even those who {174} were the objects of it. To his friends, who were frequently the objects of it, there was not, perhaps, any one of all his great and amiable qualities, which contributed more to endear his conversation. And that gaiety of temper, so agreeable in society, but which is so often accompanied with frivolous and superficial qualities, was in him certainly attended with the most severe application, the most extensive learning, the greatest depth of thought, and a capacity in every respect the most comprehensive. Upon the whole, I have always considered him, both in his lifetime and since his death, as approaching as nearly to the idea of a perfectly wise and virtuous man, as perhaps the nature of human frailty will permit. I am, &c.

Adam Smith."

Thus far have I proceeded in giving a biographical account of this great literary and worthy man. Hitherto this account has been chiefly derived from printed authorities. I shall now conclude with adding {175} a few anecdotes from my own personal knowledge, joined to some other well known facts, which Mr Hume, in *his Own Life*, has not recorded.

His own Life, as well as Mr Adam Smith's *letter* to *Mr Strahan*, are written with great candour and truth. Mr Hume, like perhaps every man of genius, had a *keeness* of temper, which he happily balanced by a strong and decisive mode of reasoning. His works met with so many and often so rude attacks from a variety of authors, that, though he did not deign to answer them in writing;

yet, in conversation, he frequently discovered the resentments which he felt from the indelicate and often ignorant insults of inferior scholars. In all cases of this kind, his forcible mode of expression, the brilliant quick movements of his eyes, and the gestures of his body, discovered the acuteness of this feelings, and the highest marks of contempt as well as of aversion. {176}

One author, however, Dr Campbell, Professor of Morals in the University of Aberdeen, a learned, a worthy, and an ingenious man, wrote a pretty large book against Mr Hume's *Essay on Miracles*, in such a style and manner, and so much like a gentleman, that Mr Hume never spoke of him but with the utmost respect; and often said, that, of all his opponents, Doctor Campbell was not only the most acute, but wrote with the best temper, and in the mildest, though forcible and elegant terms. In the first edition of the *Encyclopedia Britannica*, which was published at Edinburgh in the year 1771, under the word *Abridgment*, as an example of what I then thought to be the best and most useful mode of abridging books, I gave a short view of Mr Hume's *Essay on Miracles*, and of Dr Campbell's *answer* to it. I still think, that, as the article is short, a transcript of it may be of some value, especially to young readers.

"*Abridgment*, in literature, a term signifying the reduction of a book into a smaller compass. The art of conveying much {177} sentiment in a few words, is the happiest talent an author can be possessed of. This talent is peculiarly necessary in the present state of literature; for many writers have acquired the dexterity of spreading a few tritical thoughts over several hundred pages. When an author hits upon a thought that pleases him, he is apt to dwell upon it, to view it in different lights, to force it in improperly, or upon the slightest relations. Though this may be pleasant to the writer, it tires and vexes the reader. There is another great source of diffusion in composition. It is a capital object with an author, whatever be the subject, to give vent to all his best thoughts. When he finds a proper place for them, he is peculiarly happy. But, rather than sacrifice a thought he is fond of, he forces it in by way of digression, or superfluous illustration. If none of these expedients answer his purpose, he has recourse to the margin, a very convenient apartment for all manner of pedantry and impertinence. There is not an author, however, correct, but is more or less faulty in this respect. An abridger, however, is {178} not subject to these temptations. The thoughts are not his own; he views them in a cooler and less affectionate manner; he discovers an impropriety in some, a vanity in others, and a want of utility in many. His business, therefore, is to retrench superfluities, digressions, quotations, pedantry, &c. and to lay before the public only what is really useful. This is by no means an easy employment: To abridge some books requires talents equal, if not superior, to those of the author. The facts, spirit, manner, and reasoning, must be preserved; nothing essential, either in argument or illustration, ought to be omitted. the difficulty of the task is the principal reason why we have so few good abridgments. Wynne's abridgement of Locke's Essay on the Human Understanding is, perhaps, the only unexceptionable one in our language. These observations relate solely to such abridgments as are designated for the public. But,

"When a person wants to set down the substance of any book, a shorter and less {179} laborious method may be followed. It would be foreign to our plan to give examples of abridgments for the public: But as it may be useful, especially to young people, to know how to abridge books for their own use, after giving a few directions, we shall exhibit an example or two, to shew with what ease it may be done.

"Read he book carefully; endeavour to learn the principal view of the author; attend to the arguments employed: When you have done so, you will generally find that what the author uses as new or additional arguments, are, in reality, only collateral ones, or extensions of the principal argument. Take a piece of paper, or a common-place book, put down what the author wants to

prove, subjoin the argument or arguments, and you have the substance of the book in a few lines. For example, in his Essay on Miracles, Mr Hume's design is to prove, That miracles, which have not been the immediate objects of our senses, cannot reasonably be believed upon {180} the testimony of others. Now, his argument (for there happens to be but one) is,

"That experience, which in some things is variable, in others uniform, is our *only* guide in reasoning concerning matters of fact. A variable experience gives rise to probability only; an uniform experience amounts to a proof. Our belief of any fact from the testimony of the eye-witnesses is derived from no other principle than our experience in the veracity of human testimony. If the fact attested be miraculous, here arises a contest of two opposite experiences, or proof against proof. Now, a miracle is a violation of the laws of nature; and, as a firm and unalterable experience has established these laws, the proof against a miracle, from the very nature of the fact, is as complete as any argument from experience can possibly be imagined; and, if so, it is an undeniable consequence, that it cannot be surmounted by any proof whatever derived from human testimony."

"In Dr Campbell's Dissertation on Miracles, {181} the author's principal aim is to shew the fallacy of Mr Hume's argument; which he has done most successfully by another single argument, as follows:

"The evidence arising from human testimony *is not solely* derived from experience; on the contrary, testimony hath a natural influence on belief antecedent to experience. the early and unlimited assent given to testimony by children gradually contracts as they advance in life: It is, therefore, more consonant to truth, to say, that our *diffidence* in testimony is the result of experience, than that our *faith* in it has this foundation. Besides, the uniformity of experience, in favour of any fact, is not a proof against its being reversed in a particular instance. The evidence arising from the single testimony of a man of known veracity will go far to establish a belief in its being actually reversed: If his testimony be confirmed by a few others of the same character, we cannot with-hold our assent to the truth of it. Now, though the operations of nature are governed by uniform {182} laws, and though we have not the testimony of our senses in favour of any *violation* of them, still if, in particular instances, we have the testimony of *thousands* of our fellow-creatures, and those too men of strict integrity, swayed by no motives of ambition or interest, and governed by the principles of common sense, That they were actually eye-witnesses of these violations, the constitution of our nature obliges us to believe them."

"These two examples contain the substance of about 400 pages. -- Making private abridgments of this kind has many advantages; it engages us to read with accuracy and attention; it fixes the subject in our minds; and, if we should happen to forget, instead of reading the books again, by glancing a few lines, we are not only in possession of the chief arguments, but recall, in a good measure, the author's manner and method."

Dr Campbell having sent the manuscript of his book against Mr Hume's *Essays on Miracles* to Dr Hugh Blair of Edinburgh, {183} for his opinion of the work, Dr Blair proposed to send the manuscript to Mr Hume himself, which was accordingly done; and Mr Hume returned it to the Doctor accompanied with the following letter.

"Sir,

"I have perused the ingenious performance, which you was so obliging as to put into my hands, with all the attention possible; though not perhaps with all the seriousness and gravity which you have so frequently recommended to me. But the fault lies not in the piece, which is certainly very

acute; but in the subject. I know you will say, it lies in neither, but in myself alone. If that be so, I am sorry to say that I believe it is incurable.

"I could wish that your friend had not chosen to appear as a controversial writer, but had endeavoured to establish his principles in general, without any reference to a particular book or person; though I own he does me a great deal of honour, in thinking that any thing I have wrote deserves {184} his attention. For besides many inconveniencies, which attends that kind of writing, I see it is almost impossible to preserve decency and good manners in it. this author, for instance, says sometimes obliging things of me much beyond what I can presume to deserve; and I thence conclude that in general he did not mean to insult me: yet I meet with some other passages more worthy of Warburton and his followers than of so ingenious an author.

"But as I am not apt to lose my temper, and would still less incline to do so with a friend of your's, I shall calmly communicate to you some remarks on the argument, since you seem to desire it. I shall employ very few words; since a hint will suffice to a gentleman of this author's penetration.

"Sect. I. I would desire the author to consider, whether the medium, by which we reason concerning human testimony be different from that which leads us to draw any inferences concerning other human actions; that is, our knowledge of human nature {185} from experience? or why it is different? I suppose we conclude an honest man will not lie to us, in the same manner as we conclude that he will not cheat us. As to the youthful propensity to believe, which is corrected by experience; it seems obvious, that children adopt blindfold all the opinions, principles, sentiments, and passions of their elders, as well as credit their testimony: nor is this more strange, than that a hammer should make an impression on clay.

"Sect. II. NO man can have any other experience by his own. The experience of others becomes his only by the credit which he gives to their testimony; which proceeds from his own experience of human nature.

"Sect. III. There is no contradiction in saying, that all the testimony which ever was really given for any miracle, or ever will be given, is a subject of derision; and yet forming a fiction or supposition of a testimony for a particular miracle, which {186} might not only merit attention, but amount to a full proof of it. For instance, the absence of the sun during 48 yours; but reasonable men would only conclude from this fact, that the machine of the globe was disordered during the time.

"Page 28. I find no difficulty to explain my meaning, and yet shall not probably do it in any future edition. The proof against a miracle, as it is founded on invariable experience, is of that *species* or *kind* of proof, which is full and certain when taken alone, because it implies no doubt, as is the case with all probabilities; but there are degrees of this species, and when a weaker proof is opposed to a stronger, it is overcome.

"Page 29. There is very little more delicacy in telling a man he speaks nonsense by implication than in saying so directly.

"Sect. IV. Does a man of sense run after every silly tale of witches or hobgoblins or fairies, and canvass particularly the evidence? I never knew any one, that examined and {187} deliberated about nonsense who did not believe it before the end of his inquiries.

"Sect. 5. I wonder the author does not perceive the reason why Mr John Knox and Mr Alexander Henderson did not work as many miracles as their brethren in other churches. Miracle working was a Popish trick, and discarded with the other parts of that religion. Men must have new and

opposite ways of establishing new and opposite follies. The same reason extends to Mahomet. The Greek priests, who were in the neighbourhood of Arabia, and many of them in it, were as great miracle-workers as the Romish; and Mahomet would have been laught at for so stale and simple a device. To cast out devils, and cure the blind, where every one almost can do as much, is not the way to get any extraordinary ascendant over men. I never read of a miracle in my life, that was not meant to establish some new point of religion. There are no miracles wrought in Spain to prove the gospel, but St. Francis Xavier wrought a thousand well attested ones for that purpose {188} in the Indies. The miracles in Spain, which are also fully and completely attested, are wrought to prove the efficacy of a particular crucifix or relict, which is always a new point, or at least, no universally received.

"Sect 6. If a miracle proves a doctrine to be revealed from God, and consequently true, a miracle can never be wrought for a contrary doctrine. the facts are therefore as incompatible as the doctrines.

I could wish your friend had not denominated me an infidel writer, on account of ten or twelve pages which seem to him to have that tendency; while I have wrote so many volumes on history, literature, politics, trade, morals, which, in that particular at least, are entirely inoffensive. Is a man to be called a drunkard, because he has been seen fuddled once in his file time?

Having said so much to your friend, who {189} is certainly a very ingenious man, though a little too zealous for a philosopher; permit me also the freedom of saying a word to yourself. Whenever I have had the pleasure to be in your company, if the discourse turned upon any common subject of literature or reasoning, I always parted from you both entertained and instructed. But when the conversation was diverted by you from this channel towards the subject of your profession; though I doubt not but your intentions were very friendly towards me, I own I never received the same satisfaction: I was apt to be tired, and you to be angry. I would therefore wish for the future, wherever my good fortune throws me in your way, that these topics should be forborn between us. I have, long since, done with all inquiries on such subjects, and am become incapable of instruction; though I own no one is more capable of conveying it than yourself.

"After having given you the liberty of {190} communicating to your friend what part of this letter you think proper, I remain,

Sir

Your most obedient

humble servant,

David Hume.[17] {191}

In the year 1762, Mr Hume wrote the following letter to Dr Campbell, which does much honour to the writer.

"Dear {192} Sir, *Edin. Jan.* 7. 1762

"It has so seldom happened that controversies in philosophy, much more in theology, have been carried on without producing a personal quarrel between the parties, that I must regard my present situation as somewhat extraordinary, who have reason {193} to give you thanks for the civil and obliging manner in which you have conducted the dispute against me, on so interesting a subject as that of miracles. Any little symptoms of vehemence, of which I formerly used the freedom to complain, when you favoured me with a sight of the manuscript, are either removed or explained away, or atoned for by civilities which are far beyond what I have any title to pretend to.

It will be natural for you to imagine, that I will fall upon some shift to evade the force of your arguments, and to retain my former opinion in the point controverted between us; but it is impossible for me not to see the ingenuity of your performance, and the great learning which you ave displayed against me.

"I consider myself as very much honoured in being thought worthy of an answer by a person of so much merit; and, as I find that the public does you justice, with regard to the ingenuity and good composition of your piece, I hope you will have no reason to repent engaging with an antagonist, {194} whom perhaps, in strictness, you might have ventured to neglect. I own to you that I never felt so violent an inclination to defend myself as at present, when I am thus fairly challenged by you, and I think I could find something specious at least to urge in my defence; but, as I had fixed a resolution, in the beginning of my life, always to leave the public to judge between my adversaries and me, without making any reply,I must adhere inviolably to this resolution, otherwise my silence on any future occasion would be construed to be an inability not answer, and would be matter of triumph against me.

"It may perhaps amuse you to learn that first hint which suggested to me that argument which you have so strenuously attacked. I was walking in the cloysters of the Jesuits College of La Fleche, a town in which I passed two years of my youth, and was engaged in a conversation with a Jesuit of some parts and learning, who was relating to me, and urging some nonsensical miracle performed lately in their Convent, when I {195} was tempted to dispute against him; and, as my head was full of the topics of my Treatise of human Nature, which I was at the time composing, this argument immediately occurred to me, and I thought it very much gravelled my companion; but at last he observed to me, that it was impossible for that argument to have any solidity, because it operated equally against the Gospel as the Catholic miracles; which observation I thought proper to admit as a sufficient answer. I believe you will allow that the freedom at least of this reasoning makes it somewhat extraordinary to have been the produce of a Convent of Jesuits, though perhaps you may think that the sophistry of it favours plainly of the place of its birth."

In the year 1762, Mr Hume attached himself to the celebrated Rousseau, when the latter was about to be imprisoned, by an *arret* of the Parliament of Paris, for publishing his famous romance called *Emile*. Mr Hume was then in Edinburgh. A person, as he says, of merit, but whose name he does not mention, wrote him from Paris, {196} that M. Rousseau intended to come to Britain to procure an asylum from persecution in a land where freedom reigns, and genius and literature of every species are eminently encouraged. M. Rousseau, at the same time, asked Mr Hume's patronage and recommendation when he should arrive in London. Mr Hume, accordingly, wrote to several of his friends in London, in favour of this famous exile; and likewise wrote to himself, assuring him of his zeal and strong desire of doing every thing in his power to serve him. Mr Hume, at the same time, solicited Rousseau to come to Edinburgh, and offered him a secure retreat in his own house as long as he should chuse. Mr. Hume's principal motives for making this offer were the celebrity of Rousseau;s genius and talents, and particularly the persecution he suffered from the bigots of his own country, joined to the weak and diseased state of his body, occasioned by the passing of blood through his urethra. This disorder, like most chronical distempers, rendered his mind peevish, and, of course, made his temper and his actions frequently {197} bizarre and disagreeable, especially to strangers. Mr Hume seems, in some parts of the controversy, not to have made sufficient allowances for the weak and painful condition of his antagonist's body. Pain, when long continued, not only induces general debility, but frets and disturbs the mind, and makes it suspicious and impatient. This circumstance, it is probable, was the principal cause of the rupture

that happened between these two learned and most ingenious men. Mr Hume, however, through the whole controversy, treats M. Rousseau with humanity and respect. He, indeed, defends himself strenuously against the calumnies and insinuations of his illustrious opponent; and he was fully entitled to do so.

At the instigation of Mr Hume, Rousseau arrived in England in Spring 1766; and Mr Hume procured a pleasant residence for him in a country house belonging to Mr Davenport, a gentleman distinguished by his birth, by his fortune, and by his merit. This villa is situated in the country of Derby, and is called *Wooton*. As soon as Rousseau {198} arrived at Wooton, he was charmed with the situation of the place, as well as with the adjacent country; and wrote Mr Hume, in the most polite and grateful terms, how much he esteemed his friendship and patronage.

When on their route to Britain, one evening at Calais, Mr Hume asked Rousseau, if he would accept a pension from the king of Britain, provided it should be obtained? Rousseau replied, that he found some difficulty in answering the question; but that he would refer the affair to Lord Marshall, who was a great friend to Rousseau. Encouraged by this response, Mr Hume, as soon as he arrived in London, applied to General Conway, then Secretary of State, and likewise to General Graeme, Secretary and Chamberlain to the Queen, asking a pension to Rousseau, which was readily granted, on the sloe condition that the affair should be kept secret. This condition was highly agreeable to Rousseau, who loved to conceal such favours as he occasionally received, and particularly in what related to money-matters, because he thought {199} they degraded the spirit of independency which he always, at least, pretended to possess. But Mr Hume had, for some time, anxiously attended to the ease and interest of M. Rousseau, who continually complained both of bodily pain and of poverty, discovered with astonishment, that the last complaint of extreme poverty was false. He employed this last artifice (for the first was no artifice), Mr Hume remarks, to render himself, as a man of genius, more interesting, and to excite the compassion of the public.

The time which Mr Hume spent with M. Rousseau gradually enabled him to unfold his real character. I at last perceived, says he, with infinite pain, that this ingenious man was born for tumult and storms; but, as Mr Hume had done every thing to accommodate Rousseau, and to render his situation comfortable, he never dreamed that he himself was to become a victim of his rage and peevishness. The origin of the rupture between these two great men took its rise from a ridiculous circumstance. {200} Mr Horace Walpole, who, it would appear, was no great friend to Rousseau, wrote a letter, under the fictitious designation of *Frederic King of Prussia*, inviting him to come and reside in his Court at Berlin. Of this affair Mr Hume had no knowledge. But Rousseau, from what circumstances it is difficult to conjecture, imagined that Mr Hume had written and circulated that letter with a view to perplex and burlesque him. Mr Hume, in this more than foolish affair, excuses Mr Walpole by calling it an innocent *plaisanterie*. But, when the genius, the temper, and the diseased state of Rousseau's body are considered, instead of a *plaisanterie*, it was a direct *cruelty*, and had, by a natural mistake, the unhappy effect of converting two cordial and celebrated friends into mortal enemies.

M. Rousseau, though Mr Hume procured him a grant of a pension from his Majesty, actuated by some whimsical ideas of independency, and a notion that his best friend meant to betray him, refused to accept of it. Mr Hume, by friendly letters, {201} pressed Rousseau to accept of the pension; but the latter obstinately persisted in his denial, and even reproached Mr Hume, in terms the most indecent, for so successfully endeavouring to serve him, and to render his circumstances easy for life.

The supposititious letter, written in the name of the King of Prussia, after copies of it had been circulated over Europe, was at last published in the *St James's Chronicle*. It was in that News-paper which Rousseau first saw this imprudent and ill-judged production. M. Rousseau immediately wrote to the Editors of the St James's Chronicle complaining bitterly of the imposture, and indirectly insinuating that the pretended letter was composed by Mr Hume. When Mr Hume learnt that he was suspected by M. Rousseau to be the author and publisher of this letter, it gave him much uneasiness. Mr Hume remarks, that, after the great attention and beneficent services he had, with unremitting perseverance, bestowed on M. Rousseau, he was suddenly become the object of his resentment and obloquy, upon {202} no other foundation than a foolish and even absurd suspicion. Mr Hume, notwithstanding this unhappy affair, continued to protect and cherish Rousseau by friendly letters as well as by good offices. But, soon afterwards, Rousseau threw off every mask, and accused Mr Hume openly as a traitorous enemy, without assigning any reasons but what were evidently capricious, frivolous, and contemptible. I shall mention one example only. The first night after these two remarkable men left Paris, in their way to Britain, they both slept in the same chamber. M. Rousseau, in the last letter he ever wrote to Mr Hume, which is of an enormous length, says, that during the night, Mr Hume several times, called out, with unusual vehemence, *Je tiens J.J. Rousseau*. He, however, acknowledges, that he knew not whether Mr Hume was sleeping or waking. The expression, in the French language, is strong; but, like many verbs, *tenir* is frequently used in very different and even opposite senses. Rousseau interpreted the expression thus: *I have Rousseau in my possession*, or, *I hold him fast*. {203} Every time these words were repeated, Rousseau tells us that he trembled with terror. This and some similar insignificant circumstances gave rise to a complete rupture between those two great men.

When the periodical paper called the *Edinburgh Magazine and Review* was publishing in the year 1773, the late Rev. Dr Henry, then one of the ministers of this city, a most laborious clergyman, as well as a facetious and good-humoured companion, brought forth the second volume of his *History of Great Britain*. Dr Henry, it was said, applied, in the most earnest manner, to Mr Hume to give an account of that volume in the Review, to which Mr Hume gave his assent. When the manuscript appeared, after reading it, the praises appeared to be so high-strained, that the Reviewers, in my presence, agreed that Mr Hume's account was meant as a burlesque upon the author. It was, therefore, committed to the farther consideration of one of their number, who still continued to be of the same opinion, and, accordingly, raised the encomiums so {204} high, that no person could mistake the supposed meaning of the writer. The types of the Manuscript, in this last form, were composed, and proof-sheets sent to Mr Hume for his perusal and corrections. To the astonishment of the Reviewers, Mr Hume wrote them an angry letter, complaining, in the highest terms, of the freedoms they had used with his manuscript, and declaring that in the account he had given of Dr Henry's History, he was perfectly sincere. Upon which, Mr Hume's review was cancelled, and another was written by a member of the Society, condemning the book in terms perhaps too severe; so that Mr Hume's intention of serving Dr Henry was no only abortive, but produced an opposite effect.

Another circumstance in the life of Mr Hume must not be omitted. When a young man, he applied to be made *Professor of Moral Philosophy* in the University of Edinburgh. The Scottish clergy took an alarm. They represented that Mr Hume, in his principles, was an *Athiest*, or at least {205} a *Deist*; and, consequently, that he was very ill-qualified to teach morals to youth in a Christian country. Their remonstrances were effectual; and Mr Hume's application was rejected. From that moment, as was natural, he conceived a rooted antipathy to the generality of Scottish clergymen.

This antipathy was not, however, indiscriminate; for he was in intimate habits of friendship and sociality with several of the ministers of the Church of Scotland; as the celebrated Dr Robertson, Dr Blair, Dr Wallace, Mr Jardine, Dr Wishart, Dr Drysdale, Mr Home, the author of the ingenious and popular tragedy of *Douglas*, and many others. These reverend and learned gentlemen, however much they differed from Mr Hume in religious or philosophical opinions, were fully sensible of his Genius as an Author, and of his Worth as a Man.

I shall mention another anecdote. -- On summer evening, I went to sup with *Lord Kames*. Soon after, Dr John Warden, a worthy, a respectable, and an useful clergyman {206} of this City, came to Lord Kames's house with the same intention. Lord Kames was then dictating to his clerk. When his Lordship had finished, he led us to a drawing room, which was situated to the north, because the night was remarkably warm. Here we had conversed for some time, when Mr Hume joined the party. The conversation went on in the most agreeable manner. A sermon had just been published by a Mr Edwards with the strange title of *Usefulness of Sin*. Dr Warden told us, that he had read this sermon. Mr Hume repeated the words: The *Usefulness of Sin!* I suppose, says he, Mr Edwards adopts the system of Leibnitz, that *all is for the best, but,* added he, with his usual keenness of eye and forcible manner of expression, *What the Devil does the fellow make of hell and damnation?* Upon Mr Hume's pronouncing these words, for what reason I could never conjecture, Dr Warden took his hat and left the room. Lord Kames followed him, and pressed him with anxiety to return, but he obstinately refused. {207}

After a very tedious illness, Mr Hume expired at Edinburgh on the 25th day of August 1776, in the 65th year of his age. -- Some particulars relating to his death I have already given to my Readers in the letters of Dr Black to Dr Smith on that occasion.

Some time after Mr Hume's death, two Essays, ascribed to him, were published at London; the one on *Suicide*, and the other on *Immortality of the Soul*. These essays, from the mode of writing and of reasoning, appeared evidently to be genuine productions of Mr Hume. I once intended, in this life of Mr Hume, to give an abridged view of these arguments in these two ingenious and plausible Essays. But, after more mature reflection, as I considered the sophistry of the reasoning, and the injurious effects it might have on society; and as an abridgment of them would only be another mode of administering the poison they contain, I shall now relinquish that part of my subject, and conclude with a few general remarks. {208}

Upon the whole, Mr Hume was one of those extraordinary characters which sometimes, but rarely, appear, like luminous meteors, in almost every civilized country in Europe. For elegance of composition, for dexterous and forcible reasoning, for good humour and pleasantry in conversation, and for uniformity of temper and conduct, he was not to be excelled. Before his death, Mr Hume had written his last will, in which, beside other appointments, he allotted a certain sum for building his tomb, which he ordered to be erected in the Calton burying-ground, which is situated on a pretty high hill almost within the City of Edinburgh. Like himself, his tomb is build of massy but unadorned stones, with this simple inscription, DAVID HUME, ESQ. After the tomb was finished, one summer day I was sauntering on the Caltonhill, in company with the late well-known Dr Gilbert Stuart, and Dr John Brown, author of what is called the *Brownian System of Physic*. Dr Brown, who was a man of rough and course manners, observed to a mason, who was hewing a pavement stone, {209} "Friend," said he, "this is a strong and massy building; but how do you think the honest gentleman can get out at the resurrection?" The mason archly replied, "Sir, I have secured that point; for I have put the *key under the door*.

[17]*The following letter was sent by MR HUME to the Author of the Delineation of the Nature and Obligation of Morality*.

"SIR,

"WHEN I write you, I know not to whom I am addressing myself; I only know he is one who has done me a great deal of honour, and to whose civilities I am obliged. If we be strangers, I beg we may be acquainted as soon as you think proper to discover yourself; if we be acquainted already, I beg we may be friends; If friends, I beg we may be more so. Our connection with each other, as men of letters, is greater than our differences as adhering to different sects or systems. Let us

revive the happy times, when Atticus and Cassius the Epicureans, Cicero the Academic, and Brutus the Stoic, could, all of them, live in unreserved friendship together, and were insensible to all those distinctions, except so far as they furnished agreeable matter to discourse and conversation. Perhaps you are a young man, and being full of those sublime ideas, which you have so well exprest, think there can be no virtue upon a more confined system. I am not an old one; but being of a cool temperament, have always found, that more simple views were sufficient to make me act in a reasonable manner [Greek]; in this faith hive I lived, and hope to die.

"Your civilities to me so much over-balance your severities, that I should be ungrateful to take notice of some expressions, which, in the heat of composition, have dropt from your pen. I must only complain of you a little for ascribing to me the sentiments which I had put into the mouth of the Sceptic in the Dialogue. I have surely endeavoured to refute the Sceptic with all the force of which I am master; and my refutation must be allowed sincere, because drawn from the capital principles of my system. But you impute to me both the sentiments of the Sceptic and the sentiments of his antagonist, which I can never admit of. In every Dialogue, no more than one person can be supposed to represent the author.

"Your severity on one head, that of Chastity, is so great, and I am so little conscious of having given any just occasion to it, that it has afforded me a hint to form a conjecture, perhaps ill grounded, concerning your person.

"I hope to steal a little leisure from my other occupations, in order to defend my philosophy against your attacks. If I have occasion to give a new edition of the work ,which you have honoured with an answer, I shall make great advantage of your remarks, and hope to obviate some of your criticisms.

"Your style is elegant, and full of agreeable imagery. In some few places, it does not fully come up to my ideas of purity and correctness. I suppose mine falls still further short of your ideas. In this respect, we may certainly be of use to each other. With regard to our Philosophical systems, I suppose we are both so fixt, that there is no hope of any conversions betwixt us; and for my part, I doubt not but we shall both do as well to remain as we are.

"I am, Sir,

With great regard,

Your most obliged humble servant,

"DAVID HUME"

Prolegomena

Immanuel Kant
1783

Introduction

These Prolegomena are destined for the use, not of pupils, but of future teachers, and even the latter should not expect that they will be serviceable for the systematic exposition of a ready-made science, but merely for the discovery of the science itself.

There are scholarly men, to whom the history of philosophy (both ancient and modern) is philosophy itself; for these the present Prolegomena are not written. They must wait till those who endeavor to draw from the fountain of reason itself have completed their work; it will then be the historian's turn to inform the world of what has been done. Unfortunately, nothing can be said, which in their opinion has not been said before, and truly the same prophecy applies to all future time; for since the human reason has for many centuries speculated upon innumerable objects in various ways, it is hardly to be expected that we should not be able to discover analogies for every new idea among the old sayings of past ages.

My object is to persuade all those who think Metaphysics worth studying, that it is absolutely necessary to pause a moment, and, neglecting all that has been done, to propose first the preliminary question, 'Whether such a thing as metaphysics be at all possible?'

If it be a science, how comes it that it cannot, like other sciences, obtain universal and permanent recognition ? If not, how can it maintain its pretensions, and keep the human mind in suspense with hopes, never ceasing, yet never fulfilled? Whether then we demonstrate our knowledge or our ignorance in this field, we must come once for all to a definite conclusion respecting the nature of this so-called science, which cannot possibly remain on its present footing. It seems almost ridiculous, while every other science is continually advancing, that in this, which pretends to be Wisdom incarnate, for whose oracle every one inquires, we should constantly move round the same spot, without gaining a single step. And so its followers having melted away, we do not find men confident of their ability to shine in other sciences venturing their reputation here, where everybody, however ignorant in other matters, may deliver a final verdict, as in this domain there is as yet no standard weight and measure to distinguish sound knowledge from shallow talk.

After all it is nothing extraordinary in the elaboration of a science, when men begin to wonder how far it has advanced, that the question should at last occur, whether and how such a science is possible? Human reason so delights in constructions, that it has several times built up a tower, and then razed it to examine the nature of the foundation. It is never too late to become wise; but if the change comes late, there is always more difficulty in starting a reform.

The question whether a science be possible, presupposes a doubt as to its actuality. But such a

doubt offends the men whose whole possessions consist of this supposed jewel; hence he who raises the doubt must expect opposition from all sides. Some, in the proud consciousness of their possessions, which are ancient, and therefore considered legitimate, will take their metaphysical compendia in their hands, and look down on him with contempt; others, who never see anything except it be identical with what they have seen before, will not understand him, and everything will remain for a time, as if nothing had happened to excite the concern, or the hope, for an impending change.

Nevertheless, I venture to predict that the independent reader of these Prolegomena will not only doubt his previous science, but ultimately be fully persuaded, that it cannot exist unless the demands here stated on which its possibility depends, be satisfied; and, as this has never been done, that there is, as yet, no such thing as Metaphysics. But as it can never cease to be in demand, [2] -- since the interests of common sense are intimately interwoven with it, he must confess that a radical reform, or rather a new birth of the science after an original plan, are unavoidable, however men may struggle against it for a while.

Since the Essays of Locke and Leibniz, or rather since the origin of metaphysics so far as we know its history, nothing has ever happened which was more decisive to its fate than the attack made upon it by David Hume. He threw no light on this species of knowledge, but he certainly struck a spark from which light might have been obtained, had it caught some inflammable substance and had its smoldering fire been carefully nursed and developed.

Hume started from a single but important concept in Metaphysics, viz., that of Cause and Effect (including its derivatives force and action, etc.). He challenges reason, which pretends to have given birth to this idea from herself, to answer him by what right she thinks anything to be so constituted, that if that thing be posited, something else also must necessarily be posited; for this is the meaning of the concept of cause. He demonstrated irrefutably that it was perfectly impossible for reason to think *a priori* and by means of concepts a combination involving necessity. We cannot at all see why, in consequence of the existence of one thing, another must necessarily exist, or how the concept of such a combination can arise *a priori*. Hence he inferred, that reason was altogether deluded with reference to this concept, which she erroneously considered as one of her children, whereas in reality it was nothing but a bastard of imagination, impregnated by experience, which subsumed certain representations under the Law of Association, and mistook the subjective necessity of habit for an objective necessity arising from insight. Hence he inferred that reason had no power to think such, combinations, even generally, because her concepts would then be purely fictitious, and all her pretended *a priori* cognitions nothing but common experiences marked with a false stamp. In plain language there is not, and cannot be, any such thing as metaphysics at all. [3]

However hasty and mistaken Hume's conclusion may appear, it was at least founded upon investigation, and this investigation deserved the concentrated attention of the brighter spirits of his day as well as determined efforts on their part to discover, if possible, a happier solution of the problem in the sense proposed by him, all of which would have speedily resulted in a complete reform of the science.

But Hume suffered the usual misfortune of metaphysicians, of not being understood. It is positively painful to see bow utterly his opponents, Reid, Oswald, Beattie, and lastly Priestley, missed the point of the problem; for while they were ever taking for granted that which he doubted, and demonstrating with zeal and often with impudence that which he never thought of doubting, they so misconstrued his valuable suggestion that everything remained in its old condition, as if nothing

had happened.

The question was not whether the concept of cause was right, useful, and even indispensable for our knowledge of nature, for this Hume had never doubted; but whether that concept could be thought by reason *a priori*, and consequently whether it possessed an inner truth, independent of all experience, implying a wider application than merely to the objects of experience. This was Hume's problem. It was a question concerning the origin, not concerning the indispensable need of the concept. Were the former decided, the conditions of the use and the sphere of its valid application would have been determined as a matter of course.

But to satisfy the conditions of the problem, the opponents of the great thinker should have penetrated very deeply into the nature of reason, so far as it is concerned with pure thinking,-a task which did not suit them. They found a more convenient method of being defiant without any insight, viz., the appeal to *common sense*. It is indeed a great gift of God, to possess right, or (as they now call it) plain common sense. But this common sense must be shown practically, by well-considered and reasonable thoughts and words, not by appealing to it as an oracle, when no rational justification can be advanced. To appeal to common sense, when insight and science fail, and no sooner- this is one of the subtle discoveries of modern times, by means of which the most superficial ranter can safely enter the lists with the most thorough thinker, and hold his own. But as long as a particle of insight remains, no one would think of having recourse to this subterfuge. For what is it but an appeal to the opinion of the multitude, of whose applause the philosopher is ashamed, while the popular charlatan glories and confides in it? I should think that Hume might fairly have laid as much claim to common sense as Beattie, and in addition to a critical reason (such as the latter did not possess), which keeps common sense in check and prevents it from speculating, or, if speculations are under discussion restrains the desire to decide because it cannot satisfy itself concerning its own arguments. By this means alone can common sense remain sound. Chisels and hammers may suffice to work a piece of wood, but for steel-engraving we require an engraver's needle. Thus common sense and speculative understanding are each serviceable in their own way, the former in judgments which apply immediately to experience, the latter when we judge universally from mere concepts, as in metaphysics, where sound common sense, so called in spite of the inapplicability of the word, has no right to judge at all.

I openly confess, the suggestion of David Hume was the very thing, which many years ago first interrupted my dogmatic slumber, and gave my investigations in the field of speculative philosophy quite a new direction. I was far from following him in the conclusions at which he arrived by regarding, not the whole of his problem, but a part, which by itself can give us no information. If we start from a well-founded, but undeveloped, thought, which another has bequeathed to us, we may well hope by continued reflection to advance farther than the acute man, to whom we owe the first spark of light.

I therefore first tried whether Hume's objection could not be put into a general form, and soon found that the concept of the connection of cause and effect was by no means the only idea by which the understanding thinks the connection of things *a priori*, but rather that metaphysics consists altogether of such connections. I sought to ascertain their number, and when I had satisfactorily succeeded in this by starting from a single principle, I proceeded to the deduction of these concepts, which I was now certain were not deduced from experience, as Hume had apprehended, but sprang from the pure understanding. This deduction (which seemed impossible to my acute predecessor, which bad never even occurred to any one else, though no one had hesitated to use the concepts without investigating the basis of their objective validity) was the most

difficult task ever undertaken in the service of metaphysics; and the worst was that metaphysics, such as it then existed, could not assist me in the least, because this deduction alone can render metaphysics possible. But as soon as I had succeeded in solving Hume's problem not merely in a particular case, but with respect to the whole faculty of pure reason, I could proceed safely, though slowly, to determine the whole sphere of pure reason completely and from general principles, in its circumference as well as in its contents. This was required for metaphysics in order to construct its system according to a reliable method.

But I fear that the execution of Hume's problem in its widest extent (viz., my Critique of the Pure Reason) will fare as the problem itself fared, when first proposed. It will be misjudged because it is misunderstood, and misunderstood because men choose to skim through the book, and not to think through it-a disagreeable task, because the work is dry, obscure, opposed to all ordinary notions, and moreover long-winded. I confess, however, I did not expect, to hear from philosophers complaints of want of popularity, entertainment, and facility, when the existence of a highly prized and indispensable cognition is at stake, which cannot be established otherwise, than by the strictest rules of methodic precision. Popularity may follow, but is inadmissible at the beginning. Yet as regards a certain obscurity, arising partly from the diffuseness of the plan, owing to which. the principal points of the investigation are easily lost sight of, the complaint is just, and I intend to remove it by the present Prolegomena.

The first-mentioned work, which discusses the pure faculty of reason in its whole compass and bounds, will remain the foundation, to which the Prolegomena, as a preliminary, exercise, refer; for our critique must first be established as a complete and perfected science, before we can think of letting Metaphysics appear on the scene, or even have the most distant hope of attaining it.

We have been long accustomed to seeing antiquated knowledge produced as new by taking it out of its former context, and reducing it to system in a new suit of any fancy pattern under new titles. Most readers will set out by expecting nothing else from the Critique; but these Prolegomena may persuade him that it is a perfectly new science, of which no one has ever even thought, the very idea of which was unknown, and for which nothing hitherto accomplished can be of the smallest use, except it be the suggestion of Hume's doubts. Yet even he did not suspect such a formal science, but ran his ship ashore, for safety's sake, landing on skepticism, there to let it lie and rot; whereas my object is rather to give it a pilot, who, by means of safe astronomical principles drawn from a knowledge of the globe, and provided with a complete chart and compass, may steer the ship safely, whither he listeth.

If in a new science, which is wholly isolated and unique in its kind, we started with the prejudice that we can judge of things by means of our previously acquired knowledge, which., is precisely what has first to be called in question, we should only fancy we saw everywhere what we had already known,. the expressions, having a similar sound, only that all would appear utterly metamorphosed, senseless and unintelligible, because we should have as a foundation out own notions, made by long habit a second nature, instead of the author's. But the longwindedness of the work, so far as it depends on the subject, and not the exposition, its consequent unavoidable dryness and its scholastic precision are qualities which can only benefit the science, though they may discredit the book.

Few writers are gifted with the subtlety, and at the same time with the grace, of David Hume, or with the depth, as well as the elegance, of Moses Mendelssohn. Yet I flatter myself I might have made my own exposition popular, had my object been merely to sketch out a plan and leave its

completion to others instead of having my heart in the welfare of the science, to which I had devoted myself so long; in truth, it required no little constancy, and even self-denial, to postpone the sweets of an immediate success to the prospect of a slower, but more lasting, reputation.

Making plans is often the occupation of an opulent and boastful mind, which thus obtains the reputation of a creative genius, by demanding what it cannot itself supply; by censuring, what it cannot improve; and by proposing, what it knows not where to find. And yet something more should belong to a sound plan of a general critique of pure reason than mere conjectures, if this plan is to be other than the usual declamations of pious aspirations. But pure reason is a sphere so separate and self- contained, that we cannot touch a part without affecting all the rest. We can therefore do nothing without first determining the position; of each part, and its relation to the rest; for, as our judgment cannot be corrected by anything without, the validity and use of every part depends upon the relation in which it stands to all the rest within the domain of reason.

So in the structure of an organized body, the end of each member can only be deduced from the full conception of the whole. It may, then, be said of such a critique that it is never trustworthy except it be perfectly complete, down to the smallest elements of pure reason. In the sphere of this faculty you can determine either everything or nothing.

But although a mere sketch, preceding the Critique of Pure Reason, would be unintelligible, unreliable, and useless, it is all the more useful as a sequel. For so we are able to grasp the whole, to examine in detail the chief points of importance in the science, and to improve in many respects our exposition, as compared with the first execution of the work.

After the completion of the work I offer here such a plan which is sketched out after an analytical method, while the work itself had to be executed in the synthetical style, in order that the science may present all its articulations, as the structure of a peculiar cognitive faculty, in their natural combination. But should any reader find this plan, which I publish as the Prolegomena to any future Metaphysics, still obscure, let him consider that not every one is bound to study Metaphysics, that many minds will succeed very well, in the exact and even in deep sciences, more closely allied to practical experience, [4] while they cannot succeed in investigations dealing exclusively with abstract concepts. In such cases men should apply their talents to other subjects. But he who undertakes to judge, or still more, to construct, a system of Metaphysics, must satisfy the demands here made, either by adopting my solution, or by thoroughly refuting it, and substituting another. To evade it is impossible.

In conclusion, let it be remembered that this much-abused obscurity (frequently serving as a mere pretext under which people hide their own indolence or dullness) has its uses, since all who in other sciences observe a judicious silence, speak authoritatively in metaphysics and make bold decisions, because their ignorance is not here contrasted with the knowledge of others. Yet it does contrast with sound critical principles, which we may therefore commend in the words of Virgil:

> **" Ignavum, fucos, pecus a praesepibus arcent. "**
> **"Bees are defending their hives against drones, those indolent creatures. "**

Prolegomena

Immanuel Kant
1783

Preamble On The Peculiarities Of All Metaphysical Cognition.

Sect. 1: Of the Sources of Metaphysics

If it becomes desirable to formulate any cognition as science, it will be necessary first to determine accurately those peculiar features which no other science has in common with it, constituting its characteristics; otherwise the. boundaries of all sciences become confused, and none of them can be treated thoroughly according to its nature.

The characteristics of a science may consist of a simple difference of object, or of the sources of cognition, or of the kind of cognition, or perhaps of all three conjointly. On this, therefore, depends the idea of a possible science and its territory.

First, as concerns the sources of metaphysical cognition, its very concept implies that they cannot be empirical. Its principles (including not only its maxims but its basic notions) must never be derived from experience. It must not be physical but metaphysical knowledge, viz., knowledge lying beyond experience. It can therefore have for its basis neither external experience, which is the source of physics proper, nor internal, which is the basis of empirical psychology. It is therefore *a priori* knowledge, coming from pure Understanding and pure Reason.

But so far Metaphysics would not be distinguishable from pure Mathematics; it must therefore be called pure philosophical cognition; and for the meaning of this term I refer to the Critique of the Pure Reason (II. "Method of Transcendentalism," Chap. I., Sec. 1), where the distinction between these two employments of the reason is sufficiently explained. So far concerning the sources of metaphysical cognition.

Sect. 2. Concerning the Kind of Cognition which can alone be called Metaphysical

a. Of the Distinction between Analytical and Synthetical judgments in general. -- The peculiarity of its sources demands that metaphysical cognition must consist of nothing but *a priori* judgments. But whatever be their origin, or their logical form, there is a distinction in judgments, as to their content, according to which they are either merely explicative, adding nothing to the content of the cognition, or expansive, increasing the given cognition: the former may be called analytical, the latter synthetical, judgments.

Analytical judgments express nothing in the predicate but what has been already actually thought in the concept of the subject, though not so distinctly or with the same (full) consciousness. When I say: All bodies are extended, I have not amplified in the least my concept of body, but have only analyzed it, as extension was really thought to belong to that concept before the judgment was made, though it was not expressed, this judgment is therefore analytical. On the contrary, this judgment, All bodies have weight, contains in its predicate something not actually thought in the general concept of the body; it amplifies my knowledge by adding something to my concept, and must therefore be called synthetical.

b. The Common Principle of all Analytical Judgments is the Law of Contradiction. -- All analytical judgments depend wholly on the law of Contradiction, and are in their nature *a priori* cognitions, whether the concepts that supply them with matter be empirical or not. For the predicate of an affirmative analytical judgment is already contained in the concept of the subject, of which it cannot be denied without contradiction. In the same way its opposite is necessarily denied of the subject in an analytical, but negative, judgment, by the same law of contradiction. Such is the nature of the judgments: all bodies are extended, and no bodies are unextended (i. e., simple).

For this very reason all analytical judgments are a .priori even when the concepts are empirical, as, for example, Gold is a yellow metal; for to know this I require no experience beyond my concept of gold as a yellow metal: it is, in fact, the very concept, and I need only analyze it, without looking beyond it elsewhere.

c. Synthetical judgments require a different Principle from the Law of Contradiction.-There are synthetical *a posteriori* judgments of empirical origin; but there are also others which are proved to be certain *a priori*, and which spring from pure Understanding and Reason. Yet they both agree in this, that they cannot possibly spring from the principle of analysis, viz., the law of contradiction, alone; they require a quite different principle, though, from whatever they may be deduced, they must be subject to the law of contradiction, which must never be violated, even though everything cannot be deduced from it. I shall first classify synthetical judgments.

1. Empirical judgments are always synthetical. For it would be absurd to base an analytical judgment on experience, as our concept suffices for the purpose without requiring any testimony from experience. That body is extended, is a judgment established *a priori*, and not an empirical judgment. For before appealing to experience, we already have all the conditions of the judgment in the concept, from which we have but to elicit the predicate according to the law of contradiction, and thereby to become conscious of the necessity of the judgment, which experience could not even teach us.

2. Mathematical judgments are all synthetical. This fact seems hitherto to have altogether escaped the observation of those who have analyzed human reason; it even seems directly opposed to all their conjectures, though incontestably certain, and most important in its consequences. For as it was found that the conclusions of mathematicians all proceed according to the law of contradiction (as is demanded by all apodictic certainty), men persuaded themselves that the fundamental principles were known from the same law. This was a great mistake, for a synthetical proposition can indeed be comprehended according to the law of contradiction, but only by presupposing another synthetical proposition from which it follows, but never in itself.

First of all, we must observe that all proper mathematical judgments are *a priori*, and not empirical, because they carry with them necessity, which cannot be obtained from experience. But if this be not conceded to me, very good; I shall confine my assertion pure Mathematics, the very

notion of which implies that it contains pure *a priori* and not empirical cognitions.

It might at first be thought that the proposition 7 + 5 = 12 is a mere analytical judgment, following from the concept of the sum of seven and five, according to the law of contradiction. But on closer examination it appears that the concept of the sum Of 7+5 contains merely their union in a single number, without its being at all thought what the particular number is that unites them. The concept of twelve is by no means thought by merely thinking of the combination of seven and five; and analyze this possible sum as we may, we shall not discover twelve in the concept. We must go beyond these concepts, by calling to our aid some concrete image [*Anschauung*], i.e., either our five fingers, or five points (as Segner has it in his Arithmetic), and we must add successively the units of the five, given in some concrete image [*Anschauung*], to the concept of seven. Hence our concept is really amplified by the proposition 7 + 5 = I 2, and we add to the first a second, not thought in it. Arithmetical judgments are therefore synthetical, and the more plainly according as we take larger numbers; for in such cases it is clear that, however closely we analyze our concepts without calling visual images (Anscliauung) to our aid, we can never find the sum by such mere dissection.

All principles of geometry are no less analytical. That a straight line is the shortest path between two points, is a synthetical proposition. For my concept of straight contains nothing of quantity, but only a quality. The attribute of shortness is therefore altogether additional, and cannot be obtained by any analysis of the concept. Here, too, visualization [*Anschauung*] must come to aid us. It alone makes the synthesis possible.

Some other principles, assumed by geometers, are indeed actually analytical, and depend on the law of contradiction; but they only serve, as identical propositions, as a method of concatenation, and not as principles, e. g., a=a, the whole is equal to itself, or a + b > a, the whole is greater than its part. And yet even these, though they are recognized as valid from mere concepts, are only admitted in mathematics, because they can be represented in some visual form [*Anschauung*]. What usually makes us believe that the predicate of such apodictic[5] judgments is already contained in our concept, and that the judgment is therefore analytical, is the duplicity of the expression, requesting us to think a certain predicate as of necessity implied in the thought of a given concept, which necessity attaches to the concept. But the question is not what we are requested to join in thought to the given concept, but what we actually think together with and in it, though obscurely; and so it appears that the predicate belongs to these concepts necessarily indeed, yet not directly but indirectly by an added visualization [*Anschauung*].

Sect. 3. A Remark on the General Division of judgments into Analytical and Synthetical

This division is indispensable, as concerns the Critique of human understanding, and therefore deserves to be called classical, though otherwise it is of little use, but this is the reason why dogmatic philosophers, who always seek the sources of metaphysical judgments in Metaphysics itself, and not apart from it, in the pure laws of reason generally, altogether neglected this apparently obvious distinction. Thus the celebrated Wolf, and his acute follower Baumgarten, came to seek the proof of the principle of Sufficient Reason, which is clearly synthetical, in the principle of Contradiction. In Locke's Essay, however, I find an indication of my division. For in the fourth book (chap. iii. Sect. 9, seq.), having discussed the various connections of representations in judgments, and their sources, one of which he makes -I identity and contradiction" (analytical judgments), and another the coexistence of representations in a subject, he confesses (Sect. 10) that

our *a priori* knowledge of the latter is very narrow, and almost nothing. But in his remarks on this species of cognition, there is so little of what is definite, and reduced to rules, that we cannot wonder if no one, not even Hume, was led to make investigations concerning this sort of judgments. For such general and yet definite principles are not easily learned from other men, who have had them obscurely in their minds. We must hit on them first by our own reflection, then we find them elsewhere, where we could not possibly nave found them at first, because the authors themselves did not know that such an idea lay at the basis of their observations. Men who never think independently have nevertheless the acuteness to discover everything, after it has been once shown them, in what was said long since, though no one ever saw it there before.

Sect. 4. The General Question of the Prolegemena. - Is Metaphysics at all Possible?

Were a metaphysics, which could maintain its place as a science, really in existence; could we say, here is metaphysics, learn it, and it will convince you irresistibly and irrevocably of its truth: this question would be useless, and there would only remain that other question (which would rather be a test of our acuteness, than a proof of the existence of the thing itself), "How is the science possible, and how does reason come to attain it?" But human reason has not been so fortunate in this case. There is no single book to which you can point as you do to Euclid, and say: This is Metaphysics; here you may find the noblest objects of this science, the knowledge of a highest Being, and of a future existence, proved from principles of pure reason. We can be shown indeed many judgments, demonstrably certain, and never questioned; but these are all analytical, and rather concern the materials and the scaffolding for Metaphysics, than the extension of knowledge, which is our proper object in studying it (Sect 2). Even supposing you produce synthetical judgments (such as the law of Sufficient Reason, which you have never proved, as you ought to, from pure reason *a priori*, though we gladly concede its truth), you lapse when they come to be employed for your principal object, into such doubtful assertions, that in all ages one Metaphysics has contradicted another, either in its assertions, or their proofs, and thus has itself destroyed its own claim to lasting assent. Nay, the very attempts to set up such a science are the main cause of the early appearance of skepticism, a mental attitude in which reason treats itself with such violence that it could never have arisen save from complete despair of ever satisfying our most important aspirations. For long before men began to inquire into nature methodically, they consulted abstract reason, which had to some extent been exercised by means of ordinary experience; for reason is ever present, while laws of nature must usually be discovered with labor. So Metaphysics floated to the surface, like foam, which dissolved the moment it was scooped off. But immediately there appeared a new supply on the surface, to be ever eagerly gathered up by some, while others, instead of seeking in the depths the cause of the phenomenon, thought they showed their wisdom by ridiculing the idle labor of their neighbors.

The essential and distinguishing feature of pure mathematical cognition among all other *a priori* cognitions is, that it cannot at all proceed from concepts, but only by means of the construction of concepts (see Critique II., Method of Transcendentalism, Chap. I., sect. 1). As therefore in its judgments it must proceed beyond the concept to that which its corresponding visualization [*Anschauung*] contains, these judgments neither can, nor ought to, arise analytically, by dissecting the concept, but are all synthetical.

I cannot refrain from pointing out the disadvantage resulting to philosophy from the neglect of this

easy and apparently insignificant observation. Hume being prompted (a task worthy of a philosopher) to cast his eye over the whole field of *a priori* cognitions in which human understanding claims such mighty possessions, heedlessly severed from it a whole, and indeed its most valuable, province, viz., pure mathematics; for he thought its nature, or, so to speak, the state-constitution of this empire, depended on totally different principles, namely, on the law of contradiction alone; and although he did not divide judgments in this manner formally and universally as I have done here, what he said was equivalent to this: that mathematics contains only analytical, but metaphysics synthetical, *a priori* judgments. In this, however, he was greatly mistaken, and the mistake had a decidedly injurious effect upon his whole conception. But for this, he would have extended his question concerning the origin of our synthetical judgments far beyond the metaphysical concept of Causality, and included in it the possibility of mathematics *a priori* also, for this latter he must have assumed to be equally synthetical. And then he could not have based his metaphysical judgments on mere experience without subjecting the axioms of mathematics equally to experience, a thing which he was far too acute to do. The good company into which metaphysics would thus have been brought, would have saved it from the danger of a contemptuous ill- treatment, for the thrust intended for it must have reached mathematics, which was not and could not have been Hume's intention. Thus that acute man would have been led into considerations which must needs be similar to those that now occupy us, but which would have gained inestimably by his inimitably elegant style.

Metaphysical judgments, properly so called, are all synthetical. We must distinguish judgments pertaining to metaphysics from metaphysical judgments properly so called. Many of the former are analytical, but they only afford the means for metaphysical judgments, which are the whole end of the science, and which are always synthetical. For if there be concepts pertaining to metaphysics (as, for example, that of substance), the judgments springing from simple analysis of them also pertain to metaphysics, as, for example, substance is that which only exists as subject; and by means of several such analytical judgments, we seek to approach the definition of the concept. But as the analysis of a pure concept of the understanding pertaining to metaphysics, does not proceed in any different manner from the dissection of any other, even empirical, concepts, not pertaining to metaphysics (such as: air is an elastic fluid, the elasticity of which is not destroyed by any known degree of cold), it follows that the concept indeed, but not the analytical judgment, is properly metaphysical. This science has something peculiar in the production of its *a priori* cognitions, which must therefore be distinguished from the features it has in common with other rational knowledge. Thus the judgment, that all the substance in things is permanent, is a synthetical and properly metaphysical judgment.

If the *a priori* principles, which constitute the materials of metaphysics, have first been collected according to fixed principles, then their analysis will be of great value; it might be taught as a particular part (as a philosophia definitiva), containing nothing but analytical judgments pertaining to metaphysics, and could be treated separately from the synthetical which constitute metaphysics proper. For indeed these analyses are not elsewhere of much value, except in metaphysics, i.e., as regards the synthetical judgments, which are to be generated by these previously analyzed concepts.

The conclusion drawn in this section then is, that metaphysics is properly concerned with synthetical propositions *a priori*, and these alone constitute its end, for which it indeed requires various dissections of its concepts, viz., of its analytical judgments, but wherein the procedure is not different from that in every other kind of knowledge, in which we merely seek to render our

concepts distinct by analysis. But the generation of *a priori* cognition by concrete images as well as by concepts, in fine of synthetical propositions *a priori* in philosophical cognition, constitutes the essential subject of Metaphysics.

Weary therefore as well of dogmatism, which teaches us nothing, as of skepticism, which does not even promise us anything, not even the quiet state of a contented ignorance; disquieted by the importance of knowledge so much needed; and lastly, rendered suspicious by long experience of all knowledge which we believe we possess, or which offers itself, under the title of pure reason: there remains but one critical question on the answer to which our future procedure depends, viz., Is Metaphysics at all possible? But this question must be answered not by skeptical objections to the asseverations of some actual system of metaphysics (for we do not as yet admit such a thing to exist), but from the conception, as yet only problematical, of a science of this sort.

In the Critique of Pure Reason I have treated this question synthetically, by making inquiries into pure reason itself, and endeavoring in this source to determine the elements as well as the laws of its pure use according to principles. The task is difficult, and requires a resolute reader to penetrate by degrees into a system, based on no data except reason itself, and which therefore seeks, without resting upon any fact, to unfold knowledge from its original germs. Prolegomena, however, are designed for preparatory exercises; they are intended rather to point out what we have to do in order if possible to actualize a science, than to propound it. They must therefore rest upon something already known as trustworthy, from which we can set out with confidence, and ascend to sources as yet unknown, the discovery of which will not only explain to us what we knew, but exhibit a sphere of many cognitions which all spring from the same sources. The method of Prolegomena, especially of those designed as a preparation for future metaphysics, is consequently analytical.

But it happens fortunately, that though we cannot assume metaphysics to be an actual science, we can say with confidence that certain pure *a priori* synthetical cognitions, pure Mathematics and pure Physics are actual and given; for both contain propositions, which are thoroughly recognized as apodictically certain, partly by mere reason, partly by general consent arising from experience, and yet as independent of experience. We have therefore some at least uncontested synthetical knowledge *a priori*, and need not ask whether it be possible, for it is actual, but how it is possible, in order that we may deduce from the principle which makes the given cognitions possible the possibility of all the rest.

Sect. 5. The General Problem: How is Cognition from Pure Reason Possible?

We have above learned the significant distinction between analytical and synthetical judgments. The possibility of analytical propositions was easily comprehended, being entirely founded on the law of Contradiction. The possibility of synthetical *a posteriori* judgments, of those which are gathered from experience, also requires no particular explanation; for experience is nothing but a continual synthesis of perceptions. There remain therefore only synthetical propositions *a priori*, of which the possibility must be sought or investigated, because they must depend upon other principles than the law of contradiction.

But here we need not first establish the possibility of such propositions so as to ask whether they are possible. For there are enough of them which indeed are of undoubted certainty, and as our present method is analytical, we shall start from the fact, that such synthetical but purely rational cognition actually exists; but we must now inquire into the reason of this possibility, and ask, how

such cognition is possible, in order that we may from the principles of its possibility be enabled to determine the conditions of its use, its sphere and its limits. The proper problem upon which all depends, when expressed with scholastic precision, is therefore: How are Synthethetic Propositions *a priori* possible?

For the sake of popularity I have above expressed this problem somewhat differently, as an inquiry into purely rational cognition, which I could do for once without detriment to the desired comprehension, because, as we have only to do here with metaphysics and its sources, the reader will, I hope, after the foregoing remarks, keep in mind that when we speak of purely rational cognition, we do not mean analytical, but synthetical cognition. [6]

Metaphysics stands or falls with the solution of this problem: its very existence depends upon it. Let any one make metaphysical assertions with ever so much plausibility, let him overwhelm us with conclusions, if he has not previously proved able to answer this question satisfactorily, I have a right to say this is all vain baseless philosophy and false wisdom. You speak through pure reason, and claim, as it were to create cognitions *a priori*. by not only dissecting given concepts, but also by asserting connections which do not rest upon the law of contradiction, and which you believe you conceive quite independently of all experience; how do you arrive at this, and how will you justify your pretensions? An appeal to the consent of the common sense of mankind cannot be allowed; for that is a witness whose authority depends merely upon rumor. Says Horace:

> **" Quodcunque ostendis mihi sic, incredulus odi."**
> **"To all that which thou provest me thus, I refuse to give credence."**

The answer to this question, though indispensable, is difficult; and though the principal reason that it was not made long ago is, that the possibility of the question never occurred to anybody, there is yet another reason, which is this that a satisfactory answer to this one question requires a much more persistent, profound, and painstaking reflection, than the most diffuse work on Metaphysics, which on its first appearance promised immortality to its author. And every intelligent reader, when he carefully reflects what this problem requires, must at first be struck with its difficulty, and would regard it as insoluble and even impossible, did there not actually exist pure synthetical cognitions *a priori*. This actually happened to David Hume, though he did not conceive the question in its entire universality as is done here, and as must be done, should the answer be decisive for all Metaphysics. For how is it possible, says that acute man, that when a concept is given me, I can go beyond it and connect with it another, which is not contained in it, in such a manner as if the latter necessarily belonged to the former? Nothing but experience can furnish us with such connections (thus he concluded from the difficulty which he took to be an impossibility), and all that vaunted necessity, or, what is the same thing, all cognition assumed to be *a priori*, is nothing but a long habit of accepting something as true, and hence of mistaking subjective necessity for objective.

Should my reader complain of the difficulty and the trouble which I occasion him in the solution of this problem, he is at liberty to solve it himself in an easier way. Perhaps he will then feel under obligation to the person who has undertaken for him a labor of so profound research, and will rather be surprised at the facility with which, considering the nature of the subject, the solution has been attained. Yet it has cost years of work to solve the problem in its whole universality (using the term in the mathematical sense, viz., for that which is sufficient for all cases), and finally to exhibit it in the analytical form, as the reader finds it here.

All metaphysicians are therefore solemnly and legally suspended from their occupations till they shall have answered in a satisfactory manner the question, "How are synthetic cognitions *a priori*

possible?" For the answer contains the only credentials which they must show when they have anything to offer in the name of pure reason. But if they do not possess these credentials, they can expect nothing else of reasonable people, who have been deceived so often, than to be dismissed without further ado.

If they on the other hand desire to carry on their business, not as a science, but as an art of wholesome oratory suited to the common sense of man, they cannot in justice be prevented. They will then speak the modest language of a rational belief, they will grant that they are not allowed even to conjecture, far less to know, anything which lies beyond the bounds of all possible experience, but only to assume (not for speculative use, which they must abandon, but for practical purposes only) the existence of something that is possible and even indispensable for the guidance of the understanding and of the will in life. In this mariner alone can they be called useful and wise men, and the more so as they renounce the title of metaphysicians; for the latter profess to be speculative philosophers, and since, when judgments a prior: are under discussion, poor probabilities cannot be admitted (for what is declared to be known *a priori* is thereby announced as necessary), such men cannot be permitted to play with conjectures, but their assertions must be either science, or are worth nothing at all.

It may be said, that the entire transcendental philosophy, which necessarily precedes all metaphysics, is nothing but the complete solution of the problem here propounded, in systematical order and completeness, and hitherto we have never had any transcendental philosophy; for what goes by its name is properly a part of metaphysics, whereas the former sciences intended first to constitute the possibility of the 'matter, and must therefore precede all metaphysics. And it is not surprising that when a whole science, deprived of all help from other sciences, and consequently in itself quite new, is required to answer a -single question satisfactorily, we should find the answer troublesome and difficult, nay even shrouded in obscurity.

As we now proceed to this solution according to the analytical method, in which we assume that such cognitions from pure reasons actually exist, we can only appeal to two sciences of theoretical cognition . which alone is under consideration here), pure mathematics and pure natural science (physics). For these alone can exhibit to us objects in a definite and actualizable form (in der *Anschauung*), and consequently (if there should occur in them a cognition *a priori*) can show the truth or conformity of the cognition to the object in concrete, that is, its actuality, from which we could proceed to the reason of its possibility by the analytic method. This facilitates our work greatly for here universal considerations are not only applied to facts, but even start from them, while in a synthetic procedure they must strictly be derived in abstracts from concepts.

But, in order to rise from these actual and at the same time well-grounded pure cognitions *a priori* to such a possible cognition of the same as we are seeking, viz., to metaphysics as a science, we must comprehend that which occasions it, I mean the mere natural, though in spite of its truth not unsuspected, cognition *a priori* which lies at the bottom of that science, the elaboration of which without any critical investigation of its possibility is commonly called metaphysics. In a word, we must comprehend the natural conditions of such a science as a part of our inquiry, and thus the transcendental problem will be gradually answered by a division into four questions:

1. **How is pure mathematics possible?**
2. **How is pure natural science possible?**
3. **How is metaphysics in general possible?**
4. **How is metaphysics as a science possible?**

It may be seen that the solution of these problems, though chiefly designed to exhibit the essential matter of the Critique, has yet something peculiar, which for itself alone deserves attention. This is the search for the sources of given sciences in reason itself, so that its faculty of knowing something *a priori* may by its own deeds be investigated and measured. By this procedure these sciences gain, if not with regard to their contents, yet as to their proper use, and while they throw light on the higher question concerning their common origin, they give, at the same time, an occasion better to explain their own nature.

Immanuel Kant
1783

First Part Of The Transcendental Problem: How Is Pure Mathematics Possible?

Here is a great and established branch of knowledge, encompassing even now a wonderfully large domain and promising an unlimited extension in the future. Yet it carries with it thoroughly apodictical certainty, i.e., absolute necessity, which therefore rests upon no empirical grounds. Consequently it is a pure product of reason, and moreover is thoroughly synthetical. [Here the question arises:] "How then is it possible for human reason to produce a cognition of this nature entirely *a priori*?"

Does not this faculty [which produces mathematics], as it neither is nor can be based upon experience, presuppose some ground of cognition *a priori*, which lies deeply hidden, b,.--, which might reveal itself by these its effects, if their first beginnings were but diligently ferreted out?

Sect. 7. But we find that all mathematical cognition has this peculiarity: it must first exhibit its concept in a visual form [*Anschauung*] and indeed *a priori*, therefore in a visual form which is not empirical, but pure. Without this mathematics cannot take a single step; hence its judgments are always visual, viz., "Intuitive"; whereas philosophy must be satisfied with discursive judgments from mere concepts, and though it may illustrate its doctrines through a visual figure, can never derive them from it. This observation on the nature of mathematics gives us a clue to the first and highest condition of its possibility, which is, that some non-sensuous visualization [called pure intuition, or reine *Anschauung*] must form its basis, in which all its concepts can be exhibited or constructed, in concrete and yet *a priori*. If we can find out this pure intuition and its possibility, we may thence easily explain how synthetical propositions *a priori* are possible in pure mathematics, and consequently how this science itself is possible. Empirical intuition [viz., sense-perception] enables us without difficulty to enlarge the concept which we frame of an object of intuition [or sense-perception], by new predicates, which intuition [i.e., sense-perception] itself presents synthetically in experience. Pure intuition [viz., the visualization of forms in our imagination, from which every thing sensual, i.e., every thought of material qualities, is excluded] does so likewise, only with this difference, that in the latter case the synthetical judgment is *a priori* certain and apodictical, in the former, only *a posteriori* and empirically certain; because this latter contains only that which occurs in contingent empirical intuition, but the former, that which must necessarily be discovered in pure intuition. He.-e intuition, being an intuition *a priori*, is before all experience, viz., before any perception of particular objects, inseparably conjoined with its concept.

Sect. 8. But with this step our perplexity seems rather to increase than to lessen. For the question now is, "How is it possible to intuit [in a visual form] anything *a priori*" An intuition [viz., a visual sense perception] is such a representation as immediately depends upon the presence of the object. Hence it seems impossible to intuit from the outset *a priori*, because intuition would in that event take place without either a former or a present object to refer to, and by consequence could not be intuition. Concepts indeed are such, that we can easily form some of them *a priori*, viz., such as contain nothing but the thought of an object in general; and we need not find ourselves in an immediate relation to the object. Take, for instance, the concepts of Quantity, of Cause, etc. But even these require, in order to make them understood, a certain concrete use-that is, an application to some sense- experience [*Anschauung*], by which an object of them is given us. But how can the intuition of the object [its visualization] precede the object itself?

Sect. 9. If our intuition [i.e., our sense-experience] were perforce of such a nature as to represent things as they are in themselves, there would not be any intuition *a priori*, but intuition would be always empirical. For I can only know what is contained in the object in itself when it is present and given to me. It is indeed even then incomprehensible how the visualizing [*Anschauung*] of a present thing should make me know this thing as it is in itself, as its properties cannot migrate into my faculty of representation. But even granting this possibility, a visualizing of that sort would not take place *a priori*, that is, before the object were presented to me; for without this latter fact no reason of a relation between my representation and the object can be imagined, unless it depend upon a direct inspiration.

Therefore in one way only can my intuition [*Anschauung*] anticipate the actuality of the object, and be a cognition *a priori*, viz.: if my intuition contains nothing but the form of sensibility, antedating in my subjectivity all the actual impressions through which I am affected by objects.

For that objects of sense can only be intuitd according to this form of sensibility I can know *a priori*. Hence it follows: that propositions, which concern this form of sensuous intuition only, are possible and valid for objects of the senses; as also, conversely, that intuitions which are possible *a priori* can never concern any other things than objects of our senses. [7]

Sect. 10. Accordingly, it is only the form of sensuous intuition by which we can intuit things *a priori*, but by which we can know objects only as they appear to us (to our senses), not as they are in themselves; and this assumption is absolutely necessary if synthetical propositions *a priori* be granted as possible, or if, in case they actually occur, their possibility is to be comprehended and determined beforehand.

Now, the intuitions which pure mathematics lays at the foundation of all its cognitions and judgments which appear at once apodictic and necessary are Space and Time. For mathematics must first have all its concepts in intuition, and pure mathematics in pure intuition, that is, it must construct them. If it proceeded in any other way, it would be impossible to make any headway, for mathematics proceeds, not analytically by dissection of concepts, but synthetically, and if pure intuition be wanting, there is nothing in which the matter for synthetical judgments *a priori* can be given. Geometry is based upon the pure intuition of space. Arithmetic accomplishes its concept of number by the successive addition of units in time; and pure mechanics especially cannot attain its concepts of motion without employing the representation of time. Both representations, however, are only intuitions; for if we omit from the empirical intuitions of bodies and their alterations (motion) everything empirical, or belonging to sensation, space and time still remain, which are therefore pure intuitions that lie *a priori* at the basis of the empirical. Hence they can never be

omitted, but at the same time, by their being pure intuitions *a priori*, they prove that they are mere forms of our sensibility, which must precede all empirical intuition, or perception of actual objects, and conformably to which objects can be known *a priori*, but only as they appear to us.

Sect. 11. The problem of the present section is therefore solved. Pure mathematics, as synthetical cognition *a priori*, is only possible by referring to no other objects than those of the senses. At the basis of their empirical intuition lies a pure intuition (of space and of time) which is *a priori*. This is possible, because the latter intuition is nothing but the mere form of sensibility, which precedes the actual appearance of the objects, in, that it, in fact, makes them possible. Yet this faculty of intuiting *a priori* affects not the matter of the phenomenon (that is, the sense- element in it, for this constitutes that which is empirical), but its form, viz., space and time. Should any man venture to doubt that these are determinations adhering not to things in themselves, but to their relation to our sensibility, I should be glad to know how it can be possible to know the constitution of things *a priori*, viz., before we have any acquaintance with them and before they are presented to us. Such, however, is the case with space and time. But this is quite comprehensible as soon as both count for nothing more than formal conditions of our sensibility, while the objects count merely as phenomena; for then the form of the phenomenon, i.e., pure intuition, can by all means be represented as proceeding from ourselves, that is, *a priori*.

Sect. 12. In order to add something by way of illustration and confirmation, we need only watch the ordinary and necessary procedure of geometers. All proofs of the complete congruence of two given figures (where the one can in every respect be substituted for the other) come ultimately to this that they may be made to coincide; which is evidently nothing else than a synthetical proposition resting upon immediate intuition, and this intuition must be pure, or given *a priori*, otherwise the proposition could not rank as apodictically certain, but would have empirical certainty only. In that case, it could only be said that it is always found to be so, and holds good only as far as our perception reaches. That everywhere space (which (in its entirety] is itself no longer the boundary of another space) has three dimensions, and that space cannot in any way have more, is based on the proposition that not more than three lines can intersect at right angles in one point; but this proposition cannot by any means be shown from concepts, but rests immediately on intuition, and indeed on pure and *a priori* intuition, because it is apodictically certain. That we can require a line to be drawn to infinity (in indefinitum), or that a series of changes (for example, spaces traversed by motion) shall be infinitely continued, presupposes a representation of space and time, which can only attach to intuition, namely, so far as it in itself is bounded by nothing, for from concepts it could never be inferred. Consequently, the basis of mathematics actually are pure intuitions, which make its synthetical and apodictically valid propositions possible. Hence our transcendental deduction of the notions of space and of time explains at the same time the possibility of pure mathematics. Without some such deduction its truth may be granted, but its existence could by no means be understood, and we must assume II that everything which can be given to our senses (to the external senses in space, to the internal one in time) is intuitd by us as it appears to us, not as it is in itself."

Sect. 13. Those who cannot yet rid themselves of the notion that space and time are actual qualities inhering in things in themselves, may exercise their acumen on the following paradox. When they have in vain attempted its solution, and are free from prejudices at least for a few moments, they will suspect that the degradation of space and of time to mere forms of @ur sensuous intuition may perhaps be well founded,

If two things are quite equal in all respects ask much as can be ascertained by all means possible,

quantitatively and qualitatively, it must follow, that the one can in all cases and under all circumstances replace the other, and this substitution would not occasion the least perceptible difference. This in fact is true of plane figures in geometry; but some spherical figures exhibit, notwithstanding a complete internal agreement, such a contrast in their external relation, that the one figure cannot possibly be put in the place of the other. For instance, two spherical triangles on opposite hemispheres, which have an arc of the equator as their common base, may be quite equal, both as regards sides and angles, so that nothing is to be found in either, if it be described for itself alone and completed, that would not equally be applicable to both; and yet the one cannot be put in the place of the other (being situated upon the opposite hemisphere). Here then is an internal difference between the two triangles, which difference our understanding cannot describe as internal, and which only manifests itself by external relations in space.

But I shall adduce examples, taken from common life, that are more obvious still.

What can be more similar in every respect and in every part more alike to my hand and to my ear, than their images in a mirror? And yet I cannot put such a hand as is seen in the glass in the place of its archetype; for if this is a right hand, that in the glass is a left one, and the image or reflection of the right ear is a left one which never can serve as a substitute for the other. There are in this case no internal differences which our understanding could determine by thinking alone. Yet the differences are internal as the senses teach, for, notwithstanding their complete equality and similarity, the left hand cannot be enclosed in the same bounds as the right one (they are not congruent); the glove of one hand cannot be used for the other. What is the solution? These objects are not representations of things as they are in themselves, and as the pure understanding would know them, but sensuous intuitions, that is, appearances, the possibility of which rests upon the relation of certain things unknown in themselves to something else, viz., to our sensibility. Space is the form of the external intuition of this sensibility, and the internal determination of every space is only possible by the determination of its external relation to the whole space, of which it is a part (in other words, by its relation to the external sense). That is to say, the part is only possible through the whole, which is never the case with things in themselves, as objects of the mere understanding, but with appearances only. Hence the difference between similar and equal things, which are yet not congruent (for instance, two symmetric helices), cannot be made intelligible by any concept, but only by the relation to the right and the left hands which immediately refers to intuition.

REMARK 1.

Pure Mathematics, and especially pure geometry, can only have objective reality on condition that they refer to objects of sense. But in regard to the latter the principle holds good, that our sense representation is not a representation of things in themselves but of the way in which they appear to us. Hence it follows, that the propositions of geometry are not the results of a mere creation of our poetic imagination, and that therefore they cannot be referred with assurance to actual objects; but rather that they are necessarily valid of space, and consequently of all that may be found in space, because space is nothing else than the form of all external appearances, and it is this form alone in which objects of sense can be given. Sensibility, the form of which is the basis of geometry, is that upon which the possibility of external appearance depends. Therefore these appearances can never contain anything but what geometry prescribes to them.

It would be quite otherwise if the senses were so constituted as to represent objects as they are in

themselves. For then it would not by any means follow from the conception of space, which with all its properties serves to the geometer as an *a priori* foundation, together with what is thence inferred, must be so in nature. The space of the geometer would be considered a mere fiction, and it would not be credited with objective validity, because we cannot see how things must of necessity agree with an image of them, which we make spontaneously and previous to our acquaintance with them. But if this image, or rather this formal intuition, is the essential property of our sensibility, by means of which alone objects are given to us, and if this sensibility represents not things in themselves, but their appearances: we shall easily comprehend, and at the same time indisputably prove, that all external objects of our world of sense must necessarily coincide in the most rigorous way with the propositions of geometry; because sensibility by means of its form of external intuition, viz., by space, the same with which the geometer is occupied, makes those objects at all possible as mere appearances.

It will always remain a remarkable phenomenon in the history of philosophy, that there was a time, when even mathematicians, who at the same time were philosophers, began to doubt, not of the accuracy of their geometrical propositions so far as they concerned space, but of their objective validity and the applicability of this concept itself, and of all its corollaries, to nature. They showed much concern whether a-line in nature might not consist of physical points, and consequently that true space in the object might consist of simple [discrete] parts, while the space which the geometer has in his mind [being continuous] cannot be such. They did not recognize that this mental space renders possible the physical space, i.e., the extension of matter; that this pure space is not at all a quality of things in themselves, but a form of our sensuous faculty of representation; and that all objects in space are mere appearances, i.e., not things in themselves but representations of our sensuous intuition. But such is the case, for the space of the geometer is exactly the form of sensuous intuition which we find *a priori* in us, and contains the ground of the possibility of all external appearances (according to their form), and the latter must necessarily and most rigidly agree with the propositions of the geometer, which he draws not from any fictitious concept, but from the subjective basis of all external phenomena, which is sensibility itself. In this and no other way can geometry be made secure as to the undoubted objective reality of its propositions against all the intrigues of a shallow Metaphysics, which is surprised at them [the geometrical propositions], because it has not traced them to the sources of their concepts.

REMARK II.

Whatever is given us as object, must be given us in intuition. All our intuition however takes place by means of the senses only; the understanding intuits nothing, but only reflects. And as we have just shown that the senses never and in no manner enable us to know things in themselves, but only their appearances, which are mere representations of the sensibility, we conclude that all bodies, together with the space in which they are, must be considered nothing but mere representations in us, and exist nowhere but in our thoughts.' You will say: Is not this manifest idealism?

Idealism consists in the assertion, that there are none but thinking beings, all other things, which we think are perceived in intuition, being nothing but representations in the thinking beings, to which no object external to them corresponds in fact. Whereas I say, that things as objects of our senses existing outside us are given, but we know nothing of what they may be in themselves, knowing only their appearances, 1. e., the representations which they cause in us by affecting our senses. Consequently I grant by all means that there are bodies without us, that is, things which, though quite unknown to us as to what they are in themselves, we yet know by the representations

which their influence on our sensibility procures us, and which we call bodies, a term signifying merely the appearance of the thing which is unknown to us, but not therefore less actual. Can this be termed idealism? It is the very contrary.

Long before Locke's time, but assuredly since him, it has been generally assumed and granted without detriment to the actual existence of external things, that many of their predicates may be said to belong not to the things in themselves, but to their appearances, and to have no proper existence outside our representation. Heat, color, and taste, for instance, are of this kind. Now, if I go farther, and for weighty reasons rank as mere appearances the remaining qualities of bodies also, which are called primary, such as extension, place, and in general space, with all that which belongs to it (impenetrability or materiality, space, etc.)-no one in the least can adduce the reason of its being inadmissible. As little as the man who admits colors not to be properties of the object in itself, but only as modifications of the sense of sight, should on that account be called an idealist, so little can my system be named idealistic, merely because I find that more, nay, A11 the properties which constitute the intuition of a body belong merely to its appearance.

The existence of the thing that appears is thereby not destroyed, as in genuine idealism, but it is only shown, that we cannot possibly know it by the senses as it is in itself.

I should be glad to know what my assertions must be in order to avoid all idealism. Undoubtedly, I should say, that the representation of space is not only perfectly conformable to the relation which our sensibility has to objects-that I have said- but that it is quite similar to the object,-an assertion in which I can find as little meaning as if I said that the sensation of red has a similarity to the property of vermilion, which in me excites this sensation.

REMARK III.

Hence we may at once dismiss an easily foreseen but futile objection, "that by admitting the ideality of space and of time the whole sensible world would be turned into mere sham." At first all philosophical insight into the nature of sensuous cognition was spoiled, by making the sensibility merely a confused mode of representation, according to which we still know things as they are, but without being able to reduce everything in this our representation to a clear consciousness; whereas proof is offered by us that sensibility consists, not in this logical distinction of clearness and obscurity, but in the genetical one of the origin of cognition itself. For sensuous perception represents things not at all as they are, but only the mode in which they affect our senses, and consequently by sensuous perception appearances only and not things themselves are given to the understanding for reflection. After this necessary corrective, an objection rises from an unpardonable and almost intentional misconception, as if my doctrine turned all the things of the world of sense into mere illusion.

When an appearance is given us, we are still quite free as to how we should judge the matter. The appearance depends upon the senses, but the judgment upon the understanding, and the only question is, whether in the determination of the object there is truth or not. But the difference between truth and dreaming is not ascertained by the nature of the representations, which are referred to objects (for they are the same in both cases), but by their connection according to those rules, which determine the coherence of the representations in the concept of an object, and by ascertaining whether they can subsist together in experience or not. And it is not the fault of the appearances if our cognition takes illusion for truth, i.e., if the intuition, by which an object is given us, is considered a concept of the thing or of its existence also, which the understanding can only

think. The senses represent to us the paths of the planets as now progressive, now retrogressive, and herein is neither falsehood nor truth, because as long as we hold this path to be nothing but appearance, we do not judge of the objective nature of their motion. But as a false judgment may easily arise when the understanding is not on its guard against this subjective mode of representation being considered objective, we say they appear to move backward; it is not the senses however which must be charged with the illusion, but the understanding, whose province alone it is to give an objective judgment on appearances.

Thus, even if we did not at all reflect on the origin of our representations, whenever we connect our intuitions of sense (whatever they may contain), in space and in time, according to the rules of the coherence of all cognition in experience, illusion or truth will arise according as we are negligent or careful. It is merely a question of the use of sensuous representations in the understanding, and not of their origin. In the same way, if I consider all the representations of the senses, together with their form, space and time, to be nothing but appearances, and space and time to be a mere form of the sensibility, which is not to be met with in objects out of it, and if I make use of these representations in reference to possible experience only, there is nothing in my regarding them as appearances that can lead astray or cause illusion. For all that they can correctly cohere according to rules of truth in experience. Thus all the propositions of geometry hold good of space as well as of all the objects of the senses, consequently of all possible experience, whether I consider space as a mere form of the sensibility, or as something cleaving to the things themselves. In the former case however I comprehend how I can know *a priori* these propositions concerning all the objects of external intuition. Otherwise, everything else as regards all possible experience remains just as if I had not departed from the vulgar view.

But if I venture to go beyond all possible experience with my notions of space and time, which I cannot refrain from doing if I proclaim them qualities inherent in things in themselves (for what should prevent me from letting them hold good of the same things, even though my senses might be different, and unsuited to them?), then a grave error may arise due to illusion, for thus I would proclaim to be universally valid what is merely a subjective condition of the intuition of things and sure only for all objects of sense, viz., for all possible experience; I would refer this condition to things in themselves, and do not limit it to the conditions of experience.

My doctrine of the ideality of space and of time, therefore, far from reducing the whole sensible world to mere illusion, is the only means of securing the application of one of the most important cognitions (that which mathematics propounds *a priori*) to actual objects, and of preventing its being regarded as mere illusion. For without this observation it would be quite impossible to make out whether the intuitions of space and time, which we borrow from no experience, and which yet lie in our representation *a priori*, are not mere phantasms of our brain, to which objects do not correspond, at least not adequately, and consequently, whether we have been able to show its unquestionable validity with regard to all the objects of the sensible world just because they are mere appearances.

Secondly, though these my principles make appearances of the representations of the senses, they are so far from turning the truth of experience into mere illusion, that they are rather the only means of preventing the transcendental illusion, by which metaphysics has hitherto been deceived, leading to the childish endeavor of catching at bubbles, because appearances, which are mere representations, were taken for things in themselves. Here originated the remarkable event of the antimony of Reason which I shall mention by and by, and which is destroyed by the single observation, that appearance, as long as it is employed in experience, produces truth, but the

moment it transgresses the bounds of experience, and consequently becomes transcendent, produces nothing but illusion.

Inasmuch therefore, as I leave to things as we obtain them by the senses their actuality, and only limit our sensuous intuition of these things to this, that they represent in no respect, not even in the pure intuitions of space and of time, anything more than mere appearance of those thin-s, but never their constitution in themselves, this is not a sweeping illusion invented for nature by me. My protestation too against all charges of idealism is so valid and clear as even to seem superfluous, were there not incompetent judges, who, while they would have an old name for every deviation from their perverse though common opinion, and never judge of the spirit of philosophic nomenclature, but cling to the letter only, are ready to put their own conceits in the place of well-defined notions, and thereby deform and distort them. I have myself given this my theory the name of transcendental idealism, but that cannot authorize any one to confound it either with the empirical idealism of Descartes, (indeed, his was only an insoluble problem, owing to which he thought every one at liberty to deny the existence of the corporeal world, because it could never be proved satisfactorily), or with the mystical and visionary idealism of Berkeley, against which and other similar phantasms our Critique contains the proper antidote. My idealism concerns not the existence of things (the doubting of which, however, constitutes idealism in the ordinary sense), since it never came into my head to doubt it, but it concerns the sensuous representation of things, to which space and time especially belong. Of these [viz., space and time], consequently of all appearances in general, I have only shown, that they are neither things (but mere modes of representation), nor determinations belonging to things in themselves. But the word "transcendental," which with me means a reference of our cognition, i.e., not to things, but only to the cognitive faculty, was meant to obviate this misconception. Yet rather than give further occasion to it by this word, I now retract it, and desire this idealism of mine to be called critical. But if it be really an objectionable idealism to convert actual thin.-Is (not appearances) into mere representations.. by what name shall we call him who conversely changes mere representations to things? It may, I think, be called "dreaming idealism," in contradistinction to the former, which may be called "visionary," both of which are to be refuted by my transcendental, or, better, critical idealism.

Second Part Of The Transcendental Problem: How Is The Science Of Nature Possible?

Sect. 14. Nature is the existence of things, so far as it is determined according to universal laws. Should nature signify the existence of things in themselves, we could never know it either *a priori* or *a posteriori*. Not *a priori*, for how can we know what belongs to things in themselves, since this never can be done by the dissection of our concepts (in analytical judgments)? We do not want to know what is contained in our concept of a thing (for the [concept describes what] belongs to its logical being), but what is in the actuality of the thing superadded to our concept, and by what the thing itself is determined in its existence outside the concept. Our understanding, and the conditions on which alone it can connect the determinations of things in their existence, do not prescribe any rule to things themselves; these do not conform to our understanding, but it must conform itself to them; they must therefore be first given us in order to gather these determinations from them, wherefore they would not be known *a priori*.

A cognition of the nature of things in themselves *a posteriori* would be equally impossible. For, if experience is to teach us laws, to which the existence of things is subject, these laws, if they regard things in themselves, must belong to them of necessity even outside our experience. But experience teaches us what exists and how it exists, but never that it must necessarily exist so and not otherwise. Experience therefore can never teach us the nature of things in themselves.

Sect. 15. We nevertheless actually possess a pure science of nature in which are propounded, *a priori* and with all the necessity requisite to apodictical propositions, laws to which nature is subject. I need only call to witness that propaedeutic of natural science which, under the title of the universal Science of Nature, precedes all Physics (which is founded upon empirical principles). In it we have Mathematics applied to appearance, and also merely discursive principles (or those derived from concepts), which constitute the philosophical part of the pure cognition of nature. But there are several things in it, which are not quite pure and independent of empirical sources: such as the concept of motion, that of impenetrability (upon which the empirical concept of matter rests), that of inertia, and many others, which prevent its being called a perfectly pure science of nature. Besides, it only refers to objects of the external sense and therefore does not give an example of a universal science of nature, in the strict sense, for such a science must reduce nature in general, whether it regards the object of the external or that of the internal sense (the object of Physics as well as Psychology), to universal laws. But among the principles of this universal physics there are a few which actually have the required universality; for instance, the propositions that

"substance is permanent, " and that "every event is determined by a cause according to constant laws," etc. These are actually universal laws of nature, which subsist completely *a priori*. There is then in fact a pure science of nature, and the question arises, How is it possible?

Sect. 16. The word "nature" assumes yet another meaning, which determines the object, whereas in the former sense it only denotes the conformity to law [Gesetzmdssigkeit] of the determinations of the existence of things generally. If we consider it materialiter (i.e., in the matter that forms its objects) "nature is the complex of all the objects of experience." And with this only are we now concerned, for besides, things which can never be objects of experience, if they must be known as to their nature, would oblige us to have recourse to concepts whose meaning could never be given in concrete (by any example of possible experience). Consequently we must form for ourselves a list of concepts of their nature, the reality whereof (i.e., whether they actually refer to objects, or are mere creations of thought) could never be determined. The cognition of what cannot be an object of experience would be hyperphysical, and with things hyperphysical we are here not concerned, but only with the cognition of nature, the actuality of which can be confirmed by experience, though it [the cognition of nature] is possible *a priori* and precedes all experience.

Sect. 17. The formal [aspect] of nature in this narrower sense is therefore the conformity to law of all the objects of experience, and so far as it is known *a priori*, their necessary conformity. But it has just been shown that the laws of nature can never be known *a priori* in objects so far as they are considered not in reference to possible experience, but as things in themselves. And our inquiry here extends not to things in themselves (the properties of which we pass by), but to things as objects of possible experience, and the complex of these is what we properly designate as nature. And now I ask, when the possibility of a cognition of nature *a priori* is in question, whether it is better to arrange the problem thus: How can we know *a priori* that things as objects of experience necessarily conform to law? or thus: How is it possible to know *a priori* the necessary conformity to law of experience itself as regards all its objects generally?

Closely considered, the solution of the problem, represented in either way, amounts, with regard to the pure cognition of nature (which is the point of the question at issue), entirely to the same thing. For the subjective laws, under which alone an empirical cognition of things is possible, hold good of these things, as objects of possible experience (not as things in themselves, which are not considered here). Either of the following statements means quite the same: "A judgment of observation can never rank as experience, without the law, that 'whenever an event is observed, it is always referred to some antecedent, which it follows according to a universal rule'"; alternatively, "Everything, of which experience teaches that it happens, must have a cause."

It is, however, more commendable to choose the first formula. For we can *a priori* and previous to all given objects have a cognition of those conditions, on which alone experience is possible, but never of the laws to which things may in themselves be subject, without reference to possible experience. We cannot therefore study the nature of things *a priori* otherwise than by investigating the conditions and the universal (though subjective) laws, under which alone such a cognition as experience (as to mere form) is possible, and we determine accordingly the possibility of things, as objects of experience. For if I should choose the second formula, and seek the conditions *a priori*, on which nature as an object of experience is possible, I might easily fall into error, and fancy that I was speaking of nature as a thing in itself, and then move round in endless circles, in a vain search for laws concerning things of which nothing is given me.

Accordingly we shall here be concerned with experience only, and the universal conditions of its

possibility which are given *a priori*. Thence we shall determine nature as the whole object of all possible experience. I think it will be understood that I here do not mean the rules of the observation of a nature that is already given, for these already presuppose experience. I do not mean how (through experience) we can study the laws of nature; for these would not then be laws *a priori*, and would yield us no pure science of nature; but [I mean to ask] how the condi. tions *a priori* of the possibility of experience are at the same time the sources from which all the universal laws of nature must be derived.

Sect. 18. In the first place we must state that, while all judgments of experience [Erfahrungsurtheile] are empirical (i.e., have their ground in immediate senseperception), vice versa, all empirical judgments [empirische Urtheile] are not judgments of experience, but, besides the empirical, and in general besides what is given to the sensuous intuition, particular concepts must yet be superadded-concepts which have their origin quite *a priori* in the pure understanding, and under which every perception must be first of all subsumed and then by their means changed into experience. [8]

Empirical judgments, so far as they have objective validity, are judgments of experience; but those which are only subjectively valid, I name mere judgments of perception. The latter require no pure concept of the understanding, but only the logical connection of perception in a thinking subject. But the former always require, besides the representation of the sensuous intuition, particular concepts originally begotten in the understanding, which produce the objective validity of the judgment of experience.

All our judgments are at first merely judgments of perception; they hold good only for us (i.e., for our subject), and we do not till afterwards give them a new reference (to an object), and desire that they shall always hold good for us and in the same way for everybody else; for when a judgment agrees with an object, all judgments concerning the same object must likewise agree among themselves, and thus the objective validity of the judgment of experience signifies nothing else than its necessary universality of application. And conversely when we have reason to consider a judgment necessarily universal (which never depends upon perception, but upon the pure concept of the understanding, under which the perception is subsumed), we must consider it objective also, that is, that it expresses not merely a reference of our perception to a subject, but a quality of the object. For there would be no reason for the judgments of other men necessarily agreeing with mine, if it were not the unity of the object to which they all refer, and with which they accord; hence they must all agree with one another.

Sect. 19. Therefore objective validity and necessary universality (for everybody) are equivalent terms, and though we do not know the object in itself, yet when we consider a judgment as universal, and also necessary, we understand it to have objective validity. By this judgment we know the object (though it remains unknown as it is in itself) by the universal and necessary connection of the given perceptions. As this is the case with all objects of sense, judgments of experience take their objective validity not from the immediate cognition of the object (which is impossible), but from the condition of universal validity in empirical judgments, which, as already said, never rests upon empirical, or, in short, sensuous conditions, but upon a pure concept of the understanding. The object always remains unknown in itself; but when by the concept of the understanding the connection of the representations of the object, which are given to our sensibility, is determined as universally valid, the object is determined by this relation, and it is the judgment that is objective.

To illustrate the matter: When we say, "the room is warm, sugar sweet, and wormwood bitter," [9] -- we have only subjectively valid judgments, I do not at all expect that I or any other person shall always find it as I now do; each of these sentences only expresses a relation of two sensations to the same subject, to myself, and that only in my present state of perception; consequently they are not valid of the object. Such are judgments of perception. judgments of experience are of quite a different nature. What experience teaches me under certain circumstances, it must always teach me and everybody; and its validity is not limited to the subject nor to its state at a particular time. Hence I pronounce all such judgments as being objectively valid. For instance, when I say the air is elastic, this judgment is as yet a judgment of perception only-I do nothing but refer two of my sensations to one another. But, if I would have it called a judgment of experience, I require this connection to stand under a condition, which makes it universally valid. I desire therefore that I and everybody else should always connect necessarily the same perceptions under the same circumstances.

Sect. 20. We must consequently analyze experience in order to see what is contained in this product of the senses and of the understanding, and how the judgment of experience itself is possible. The foundation is the intuition of which I become conscious, i.e., perception (perceptio), which pertains merely to the senses. But in the next place, there are acts of judging (which belong only to the understanding). But this judging may be twofold-first, I may merely compare perceptions and connect them in a particular state of my consciousness; or, secondly, I may connect them in consciousness generally. The former judgment is merely a judgment of perception, and of subjective validity only: it is merely a connection of perceptions in my mental state, without reference to the object. Hence it is not, as is commonly imagined, enough for experience to compare perceptions and to connect them in consciousness through judgment; there arises no universality and necessity, for which alone judgments can become objectively valid and be called experience.

Quite another judgment therefore is required before perception can become experience. The given intuition must be subsumed under a concept, which determines the form of judging in general relatively to the intuition, connects its empirical consciousness in consciousness generally, and thereby procures universal validity for empirical judgments. A concept of this nature is a pure *a priori* concept of the Understanding, which does nothing but determine for an intuition the general way in which it can be used for judgments. Let the concept be that of cause, then it determined the intuition which is subsumed under it, e.g., that of air, relative to judgments in general, viz., the concept of air serves with regard to its expansion in the relation of antecedent to consequent in a hypothetical judgment. The concept of cause accordingly is a pure concept of the understanding, which is totally disparate from all possible perception, and only serves to determine the representation subsumed under it, relatively to judgments in general, and so to make a universally valid judgment possible.

Before, therefore, a judgment of perception can become a judgment of experience, it is requisite that the perception should be subsumed under some such a concept of the understanding.; for instance, air ranks under the concept of causes, which determines our judgment about it in regard to its expansion as hypothetical. [10] Thereby the expansion of the air is represented not as merely belonging to the perception of the air in my present state or in several states of mine, or in the state of perception of others, but as belonging to it necessarily. The judgment, "the air is elastic," becomes universally valid, and a judgment of experience, only by certain judgments preceding it, which subsume the intuition of air under the concept of cause and effect: and they thereby

determine the perceptions not merely as regards one another in me, but relatively to the form of judging in general, which is here hypothetical, and in this way they render the empirical judgment universally valid.

If all our synthetical judgments are analyzed so far as they are objectively valid, it will be found that they never consist of mere intuitions connected only (as is commonly believed) by comparison into a judgment; but that they would be impossible were not a pure concept of the understanding superadded to the concepts abstracted from intuition, under which concept these latter are subsumed, and in this manner only combined into an objectively valid judgment. Even the judgments of pure mathematics in their simplest axioms are not exempt from this condition. The principle, II a straight line is the shortest between two points," presupposes that the line is subsumed under the concept of quantity, which certainly is no mere intuition, but bas its seat in the understanding alone, and serves to determine the intuition (of the line) with regard to the judgments which may be made about it, relatively to their quantity, that is, to plurality (as judicia plurativa). [11] For under them it is understood that in a given intuition there is contained a plurality of homogenous parts.

Sect. 21. To prove, then, the possibility of experience so far as it rests upon pure concepts of the understanding *a priori*, we must first represent what belongs to judgments in general and the various functions of the understanding, in a complete table. For the pure concepts of the understanding must run parallel to these functions, as such concepts are nothing more than concepts of intuitions in general, so far as these are determined by one or other of these functions of judging, in themselves, that is, necessarily and universally. Hereby also the *a priori* principles of the possibility of all experience, as of an objectively valid empirical cognition, will be precisely determined. For they are nothing but propositions by which all perception is (under certain universal conditions of intuition) subsumed under those pure concepts of the understanding.

2. Anticipations of Perception.
3. Analogies of Experience.
4. Postulates of Empirical Thinking generally.

Sect. 21a. In order to comprise the whole matter in one idea, it is first necessary to remind the reader that we are discussing not the origin of experience, but of that which lies in experience. The former pertains to empirical psychology, and would even then never be adequately explained without the latter, which belongs to the Critique of cognition, and particularly of the understanding.

Experience consists of intuitions, which belong to the sensibility, and of judgments, which are entirely a work of the understanding. But the judgments, which the understanding forms alone from sensuous intuitions, are far from being judgments of experience. For in the one case the judgment connects only the perceptions as they are given in the sensuous intuition, while in the other the judgments must express what experience in general, and not what the mere perception (which possesses only subjective validity) contains. The judgment of experience must therefore add to the sensuous intuition and its logical connection in a judgment (after it has been rendered universal by comparison) something that determines the synthetical judgment as necessary and therefore as universally valid. This can be nothing else than that concept which represents the intuition as determined in itself with regard to one form of judgment rather than another, viz., a concept of that synthetical unity of intuitions which can only be represented by a given logical

function of judgments.

Sect. 22. The sum of the matter is this: the business of the senses is to intuit -- that of the understanding is to think. But thinking is uniting representations in one consciousness. This union originates either merely relative to the subject, and is accidental and subjective, or is absolute, and is necessary or objective. The union of representations in one consciousness is judgment. Thinking therefore is the same as judging, or referring representations to judgments in general. Hence judgments are either merely subjective, when representations are referred to a consciousness in one subject only, and united in it, or objective, when they are united in a consciousness generally, that is, necessarily. The logical functions of all judgments are but various modes of uniting representations in consciousness. But if they serve for concepts, they are concepts of their necessary union in a consciousness, and so principles of objectively valid judgments. This union in a consciousness is either analytical, by identity, or synthetical, by the combination and addition of various representations one to another. Experience consists in the synthetical connection of phenomena (perceptions) in consciousness, so far as this connection is necessary. Hence the pure concepts of the understanding are those under which all perceptions must be subsumed ere they can serve for judgments of experience, in which the synthetical unity of the perceptions is represented as necessary and universally valid. [12]

Sect. 23. judgments, when considered merely as the condition of the union of given representations in a consciousness, are rules. These rules, so far as they represent the union as necessary, are rules *a priori*, and so far as they cannot be deduced from higher rules, are fundamental principles. But in regard to the possibility of all experience, merely in relation to the form of thinking in it, no conditions of judgments of experience are higher than those which bring the phenomena, according to the various form of their intuition, under pure concepts of the understanding, and render the empirical judgment objectively valid. These concepts are therefore the *a priori* principles of possible experience.

The principles of possible experience are then at the same time universal laws of nature, which can be known *a priori*. And thus the problem in our second question, "How is the pure Science of Nature possible?" is solved. For the system which is required for the form of a science is to be met with in perfection here, because, beyond the above-mentioned formal conditions of all judgments in general offered in logic, no others are possible, and these constitute a logical system. The concepts grounded thereupon, which contain the *a priori* conditions of all synthetical and necessary judgments, accordingly constitute a transcendental system. Finally the principles, by means of which all phenomena are subsumed under these concepts, constitute a physical[13] system, that is, a system of nature, which precedes all empirical cognition of nature, makes it even possible, and hence may in strictness be denominated the universal and pure science of nature.

Sect. 24. The first one[14] of the physiological principles subsumes all phenomena, as intuitions in space and time, under the concept of Quantity, and is so far a principle of the application of Mathematics to experience. The second one subsumes the empirical element, viz., sensation, which denotes the real in intuitions, not indeed directly under the concept of quantity, because sensation is not an intuition that contains either space or time, though it places the respective object into both. But still there is between reality (sense-representation) and the zero, or total void of intuition in time, a difference which has a quantity. For between every given degree of light and of darkness, between every degree of beat and of absolute cold, between every degree of weight and of absolute lightness, between every degree of occupied space and of totally void space, diminishing degrees

can be conceived, in the same manner as between consciousness and total unconsciousness (the darkness of a psychological blank) ever diminishing degrees obtain. Hence there is no perception that can prove an absolute absence of it; for instance, no psychological darkness that cannot be considered as a kind of consciousness, which is only out-balanced by a stronger consciousness. This occurs in all cases of sensation, and so the understanding can anticipate even sensations, which constitute the peculiar quality of empirical representations (appearances), by means of the principle: "that they all have (consequently that what is real in all phenomena has) a degree." Here is the second application of mathematics (mathesis intensortim) to the science of nature.

Sect. 25. Anent the relation of appearances merely with a view to their existence, the determination is not mathematical but dynamical, and can never be objectively valid, consequently never fit for experience, if it does not come under *a priori* principles by which the cognition of experience relative to appearances becomes even possible. Hence appearances must be subsumed under the concept of Substance, which is the foundation of all determination of existence, as a concept of the thing itself; or secondly so far as a succession is found among phenomena, that is, an event-under the concept of an Effect with reference to Cause; or lastly-so far as coexistence is to be known objectively, that is, by a judgment of experience-under the concept of Community (action and reaction).[15] Thus *a priori* principles form the basis of objectively valid, though empirical judgments, that is, of the possibility of experience so far as it must connect objects as existing in nature. These principles are the proper laws of nature, which may be termed dynamical.

Finally the cognition of the agreement and connection not only of appearances among themselves in experience, but of their relation to experience in general, belongs to the judgments of experience. This relation contains either their agreement with the formal conditions, which the understanding knows, or their coherence with the materials of the senses and of perception, or combines both into one concept. Consequently it contains Possibility, Actuality, and Necessity according to universal laws of nature; and this constitutes the physical doctrine of method, or the distinction of truth and of hypotheses, and the bounds of the certainty of the latter.

Sect. 26. The third table of Principles drawn from the nature of the understanding itself after the critical method, shows an inherent perfection, which raises it far above every other table which has hitherto though in vain been tried or may yet be tried by analyzing the objects themselves dogmatically. It exhibits all synthetical *a priori* principles completely and according to one principle, viz., the faculty of judging in general, constituting the essence of experience as regards the understanding, so that we can be certain that there are no more such principles, which affords a satisfaction such as can never be attained by the dogmatical method. Yet is this not all: there is a still greater merit in it.

We must carefully bear in mind the proof which shows the possibility of this cognition *a priori*, and at the same time limits all such principles to a condition which must never be lost sight of, if we desire it not to be misunderstood, and extended in use beyond the original sense which the understanding attaches to it. This limit is that they contain nothing but the conditions of possible experience in general so far as it is Subjected to laws *a priori*. Consequently I do not say, that things in themselves possess a quantity, that their actuality possesses a degree, their existence a connection of accidents in a substance, etc. This nobody can prove, because such a synthetical connection from mere concepts, without any reference to sensuous intuition on the one side, or connection of it in a possible experience on the other, is absolutely impossible. The essential limitation of the concepts in these principles then is: That all things stand necessarily *a priori* under

the aforementioned conditions, as objects of experience only.

Hence there follows secondly a specifically peculiar mode of proof of these principles: they are not directly referred to appearances and to their relations, but to the possibility of experience, of which appearances constitute the matter only, not the form. Thus they are referred to objectively and universally valid synthetical propositions, in which we distinguish judgments of experience from those of perception. This takes place because appearances, as mere intuitions, occupying a part of space and time, come under the concept of Quantity, which unites their multiplicity *a priori* according to rules synthetically. Again, so far as the perception contains, besides intuition, sensibility, and between the latter and nothing (i.e., the total disappearance of sensibility), there is an ever-decreasing transition, it is apparent that that which is in appearances must have a degree, so far as it (viz., the perception) does not itself occupy any part of space or of time. [16] Still the transition to actuality from empty time or empty space is only possible in time; consequently though sensibility, as the quality of empirical intuition, can never be known *a priori*, by its specific difference from other sensibilities, yet it can, in a possible experience in general, as a quantity of perception be intensely distinguished from every other similar perception. Hence the application of mathematics to nature, as regards the sensuous intuition by which nature is given to us, becomes possible and is thus determined.

Above all, the reader must pay attention to the mode of proof of the principles which occur under the title of Analogies of experience. For these do not refer to the genesis of intuitions, as do the principles of applied mathematics, but to the connection of their existence in experience; and this can be nothing but the determination of their existence in time according to necessary laws, under which alone the connection is objectively valid, and thus becomes experience. The proof therefore does not turn on the synthetical unity in the connection of things in themselves, but merely of perceptions, and of these not in regard to their matter, but to the determination of time and of the relation of their existence in it, according to universal laws. If the empirical determination in relative time is indeed objectively valid (i.e., experience), these universal laws contain the necessary determination of existence in time generally (viz., according to a rule of the understanding *a priori*).

In these Prolegomena I cannot further descant on the subject, but my reader (who has probably been long accustomed to consider experience a mere empirical synthesis of perceptions, and hence not considered that it goes much beyond them, as it imparts to empirical judgments universal validity, and for that purpose requires a pure and *a priori* unity of the understanding) is recommended to pay special attention to this distinction of experience from a mere aggregate of perceptions, and to judge the mode of proof from this point of view.

Sect. 27. Now we are prepared to remove Hume's doubt. He justly maintains, that we cannot comprehend by reason the possibility of Causality, that is, of the reference of the existence of one thing to the existence of another, which is necessitated by the former. I add, that we comprehend just as little the concept of Subsistence, that is, the necessity that at the foundation of the existence of things there lies a subject which cannot itself be a predicate of any other thing; nay, we cannot even form a notion of the possibility of such a thing (though we can point out examples of its use in experience). The very same incomprehensibility affects the Community of things, as we cannot comprehend bow from the state of one thing an inference to the state of quite another thing beyond it, and vice versa, can be drawn, and how substances which have each their own separate existence should depend upon one another necessarily. But I am very far from holding these concepts to be derived merely from experience, and the necessity represented in them, to be imaginary and a

mere illusion produced in us by long habit. On the contrary, I have amply shown, that they and the theorems derived from them are firmly established *a priori*, or before all experience, and have their undoubted objective value, though only with regard to experience.

Sect. 28. Though I have no notion of such a connection of things in themselves, that they can either exist as substances, or act as causes, or stand in community with others (as parts of a real whole), and I can just as little conceive such properties in appearances as such (because those concepts contain nothing that lies in the appearances, but only what the understanding alone must think): we have yet a notion of such a connection of representations in our understanding, and in judgments generally; consisting in this that representations appear in one sort of judgments as subject in relation to predicates, in another as reason in relation to consequences, and in a third as parts, which constitute together a total possible cognition. Besides we know *a priori* that without considering the representation of an object as determined in some of these respects, we can have no valid cognition of the object, and, if we should occupy ourselves about the object in itself, there is no possible attribute, by which I could know that it is determined under any of these aspects, that is, under the concept either of substance, or of cause, or (in relation to other substances) of community, for I have no notion of the possibility of such a connection of existence. But the question is not how things in themselves, but how the empirical cognition of things is determined as regards the above aspects of judgments in general, that is, how things, as objects of experience, can and shall be subsumed under these concepts of the understanding. And then it is clear, that I completely comprehend not only the possibility, but also the necessity of subsuming all phenomena under these concepts, that is, of using them for principles of the possibility of experience.

Sect. 29. When making an experiment with Hume's problematical concept (his crux metaphysicorum), the concept of cause, we have, in the first place, given *a priori*, by means of logic, the form of a conditional judgment in general, i.e., we have one given cognition as antecedent and another as consequence. But it is possible, that in perception we may meet with a rule of relation, which runs thus: that a certain phenomenon is constantly followed by another (though not conversely), and this is a case for me to use the hypothetical judgment, and, for instance, to say, if the sun shines long enough upon a body, it grows warm. Here there is indeed as yet no necessity of connection, or concept of cause. But I proceed and say, that if this proposition, which is merely a subjective connection of perceptions, is to be a judgment of experience, it must be considered as necessary and universally valid. Such a proposition would be, II the sun is by its light the cause of heat." The empirical rule is now considered as a law, and as valid not merely of appearances but valid of them for the purposes of a possible experience which requires universal and therefore necessarily valid rules. I therefore easily comprehend the concept of cause, as a concept necessarily belonging to the mere form of experience, and its possibility as a synthetical union of perceptions in consciousness generally; but I do not at all comprehend the possibility of a thing generally as a cause, because the concept of cause denotes a condition not at all belonging to things, but to experience. It is nothing in fact but an objectively valid cognition of appearances and of their succession, so far as the antecedent can be conjoined with the consequent according to the rule of hypothetical judgments.

Sect. 30. Hence if the pure concepts of the understanding do not refer to objects of experience but to things in themselves (noumena), they have no signification whatever. They serve, as it were, only to decipher appearances, that we may be able to read them as experience. The principles which arise from their reference to the sensible world, only serve our understanding for empirical use. Beyond this they are arbitrary combinations, without objective reality, and we can neither know

their possibility *a priori*, nor verify their reference to objects, let alone make it intelligible by any example; because examples can only be borrowed from some possible experience, consequently the objects of these concepts can be found nowhere but in a possible experience.

This complete (though to its originator unexpected) solution of Hume's problem rescues for the pure concepts of the understanding their *a priori* origin, and for the universal laws of nature their validity, as laws of the understanding, yet in such a way as to limit their use to experience, because their possibility depends solely on the reference of the understanding to experience, but with a completely reversed mode of connection which never occurred to Hume, not by deriving them from experience, but by deriving experience from them.

This is therefore the result of all our foregoing inquiries: "All synthetical principles *a priori* are nothing more than principles of possible experience, and can never be referred to things in themselves, but to appearances as objects of experience. And hence pure mathematics as well as a pure science of nature can never be referred to anything more than mere appearances, and can only represent either that which makes experience generally possible, or else that which, as it is derived from these principles, must always be capable of being represented in some possible experience."

Sect. 31. And thus we have at last something definite, upon which to depend in all metaphysical enterprises, which have hitherto, boldly enough but always at random, attempted everything without discrimination. That the aim of their exertions should be so near, struck neither the dogmatical thinkers nor those who, confident in their supposed sound common sense, started with concepts and principles of pure reason (which were legitimate and natural, but destined for mere empirical use) in quest of fields of knowledge, to which they neither knew nor could know any determinate bounds, because they bad never reflected nor were able to reflect on the nature or even on the possibility of such a pure understanding.

Many a naturalist of pure reason (by which I mean the man who believes he can decide in matters of metaphysics without any science) may pretend, that lie long ago by the prophetic spirit of his sound sense, not only suspected, but knew and comprehended, what is here propounded with so much ado, or, if he likes, with prolix and pedantic pomp: "that with all our reason we can never reach beyond the field of experience." But when he is questioned about his rational principles individually, he must grant, that there are many of them which be has not taken from experience, and which are therefore independent of it and valid *a priori*. How then and on what grounds will he restrain both himself and the dogmatist, who makes use of these concepts and principles beyond all possible experience, because they are recognized to be independent of it? And even he, this adept in sound sense, in spite of all his assumed and cheaply acquired wisdom, is not exempt from wandering inadvertently beyond objects of experience into the field of chimeras. He is often deeply enough involved in them, though in announcing everything as mere probability, rational conjecture, or analogy, be gives by his popular language a color to his groundless pretensions.

Sect. 32. Since the oldest days of philosophy inquirers into pure reason have conceived, besides the things of sense, or appearances (phenomena), which make up the sensible world, certain creations of the understanding (Verstandeswesen), called noumena, which should constitute an intelligible world. And as appearance and illusion were by those men identified (a thing which we may well excuse in an undeveloped epoch), actuality was only conceded to the creations of thought.

And we indeed, rightly considering objects of sense as mere appearances, confess thereby that they are based upon a thing in itself, though we know not this thing in its internal constitution, but only

know its appearances, viz., the way in which our senses are affected by this unknown something. The understanding therefore, by assuming appearances, grants the existence of things in themselves also, and so far we may say, that the representation of such things as form the basis of phenomena, consequently of mere creations of the understanding, is not only admissible, but unavoidable.

Our critical deduction by no means excludes things of that sort (noumena), but rather limits the principles of the Aesthetic (the science of the sensibility) to this, that they shall not extend to all things, as everything would then be turned into mere appearance, but that they shall only hold good of objects of possible experience. Hereby then objects of the understanding are granted, but with the inculcation of this rule which admits of no exception: "that we neither know nor can know anything at all definite of these pure objects of the understanding, because our pure concepts of the understanding as well as our pure intuitions extend to nothing but objects of possible experience, consequently to mere things of sense, and as soon as we leave this sphere these concepts retain no meaning whatever."

Sect. 33. There is indeed something seductive in our pure concepts of the understanding, which tempts us to a transcendent use, -- a use which transcends all possible experience. Not only are our concepts of substance, of power, of action, of reality, and others, quite independent of experience, containing nothing of sense appearance, and so apparently applicable to things in themselves (noumena), but, what strengthens this conjecture, they contain a necessity of determination in themselves, which experience never attains. The concept of cause implies a rule, according to which one state follows another necessarily; but experience can only show us, that one state of things often, or at most, commonly, follows another, an(i therefore affords neither strict universality, nor necessity.

Hence the Categories seem to have a deeper meaning and import than can be exhausted by their empirical use, and so the understanding inadvertently adds for itself to the house of experience a much more extensive wing, which it fills with nothing but creatures of thought, without ever observing that it has transgressed with its otherwise lawful concepts the bounds of their use.

Sect. 34. Two important, and even indispensable, though very dry, investigations had therefore become indispensable in the Critique of Pure Reason,-viz., the two chapters "Vom Schematismus der reinen Verstandsbegriffe," and "Vom Grunde der Unterscheidung aller Verstandesbegriffe uberhaupt in Phenomena und Noumena. " In the former it is shown, that the senses furnish not the pure concepts of the understanding in concreto, but only the schedule for their use, and that the object conformable to it occurs only in experience (as the product of the understanding from materials of the sensibility). In the latter it is shown, that, although our pure concepts of the understanding and our principles are independent of experience, and despite of the apparently greater sphere of their use, still nothing whatever can be thought by them beyond the field of experience, because they can do nothing but merely determine the logical form of the judgment relatively to given intuitions. But as there is no intuition at all beyond the field of the sensibility, these pure concepts, as they cannot possibly be exhibited in concrete, are void of all meaning; consequently all these noumena, together with their complex, the intelligible world, [17] are nothing but representation of a problem, of which the object in itself is possible, but the solution, from the nature of our understanding, totally impossible. For our understanding is not a faculty of intuition, but of the connection of given intuitions in experience. Experience must therefore contain all the objects for our concepts; but beyond it no concepts have any significance, as there is no intuition

that might offer them a foundation.

Sect. 35. The imagination may perhaps be forgiven for occasional vagaries, and for not keeping carefully within the limits of experience, since it gains life and vigor by such flights, and since it is always easier to moderate its boldness, than to stimulate its languor. But the understanding which ought to think can never be forgiven for indulging in vagaries; for we depend upon it alone for assistance to set bounds, when necessary, to the vagaries of the imagination.

But the understanding begins its aberrations very innocently and modestly. It first elucidates the elementary cognitions, which inhere in it prior to all experience, but yet must always have their application in experience. It gradually drops these limits, and what is there to prevent it, as it has quite freely derived its principles from itself? And then it proceeds first to newly-imagined powers in nature, then to beings outside nature; in short to a world, for whose construction the materials cannot be wanting, because fertile fiction furnishes them abundantly, and though not confirmed, is never refuted, by experience. This is the reason that young thinkers arc so partial to nietaph3,sics of the truly dogmatical kind, and often sacrifice to it their time and their talents, which might be otherwise better employed.

But there is no use in trying to moderate these fruitless endeavors of pure reason by all manner of cautions as to the difficulties of solving questions so occult, by complaints of the limits of our reason, and by degrading our assertions into mere conjectures. For if their impossibility is not distinctly shown, and reason's cognition of its own essence does not become a true science, in which the field of its right use is distinguished, so to say, with mathematical certainty from that of its worthless and idle use, these fruitless efforts will never be abandoned for good.

Sect. 36. How is Nature itself possible?

This question -- the highest point that transcendental philosophy can ever reach, and to which, as its boundary and completion, it must proceed-properly contains two questions.

First: How is nature at all possible in the material sense, by intuition, considered as the totality of appearances; how are space, time, and that which fills both -- the object of sensation, in general possible? The answer is: By means of the constitution of our Sensibility, according to which it is specifically affected by objects, which are in themselves unknown to it, and totally distinct from those phenomena. This answer is given in the Critique itself in the transcendental Aesthetic, and in these Prolegomena by the solution of the first general problem.

Secondly: How is nature possible in the formal sense, as the totality of the rules, under which all phenomena must come, in order to be thought as connected in experience? The answer must be this: it is only possible by means of the constitution of our Understanding, according to which all the above representations of the sensibility are necessarily referred to a consciousness, and by which the peculiar way in which we think (viz., by rules), and hence experience also, are possible, but must be clearly distinguished from an insight into the objects in themselves. This answer is given in the Critique itself in the transcendental Logic, and in these Prolegomena, in the course of the solution of the second main problem.

But how this peculiar property of our sensibility itself is possible, or that of our understanding and of the apperception which is necessarily its basis and that of all thinking, cannot be further analyzed or answered, because it is of them that we are in need for all our answers and for all our thinking about objects.

There are many laws of nature, which we can only know by means of experience; but conformity to law in the connection of appearances, i.e., in nature in general, we cannot discover by any experience, because experience itself requires laws which are *a priori* at the basis of its possibility.

The possibility of experience in general is therefore at the same time the universal law of nature, and the principles of the experience are the very laws of nature. For we do not know nature but as the totality of appearances, i.e., of representations in us, and hence we can only derive the laws of its connection from the principles of their connection in us, that is, from the conditions of their necessary union in consciousness, which constitutes the possibility of experience.

Even the main proposition expounded throughout this section - - that universal laws of nature can be distinctly known *a priori* -- leads naturally to the proposition: that the highest legislation of nature must lie in ourselves, i.e., in our understanding, and that we must not seek the universal laws of nature in nature by means of experience, but conversely must seek nature, as to its universal conformity to law, in the conditions of the possibility of experience, which lie in our sensibility and in our understanding. For bow were it otherwise possible to know *a priori* these laws, as they are not rules of analytical cognition, but truly synthetical extensions of it?

Such a necessary agreement of the principles of possible experience with the laws of the possibility of nature, can only proceed from one of two reasons: either these laws are drawn from nature by means of experience, or conversely nature is derived from the laws of the possibility of experience in general, and is quite the same as the mere universal conformity to law of the latter. The former is self-contradictory, for the universal laws of nature can and must be known *a priori* (that is, independent of all experience), and be the foundation of all empirical use of the understanding; the latter alternative therefore alone remains. [18]

But we must distinguish the empirical laws of nature, which always presuppose particular perceptions, from the pure or universal laws of nature, which, without being based on particular perceptions, contain merely the conditions of their necessary union in experience. In relation to the latter, nature and possible experience are quite the same, and as the conformity to law here depends upon the -necessary connection of appearances in experience (without which we cannot know any object whatever in the sensible world), consequently upon the original laws of the understanding, it seems at first strange, but is not the less certain, to say: The understanding does not derive its laws (*a priori*) from, but prescribes them to, nature.

Sect. 37. We shall illustrate this seemingly bold proposition by an example, which will show, that laws, which we discover in objects of sensuous intuition (especially when these laws are known as necessary), are commonly held by us to be such as have been placed there by the understanding, in spite of their being similar in all points to the laws of nature, which we ascribe to experience.

Sect. 38. If we consider the properties of the circle, by which this figure combines so many arbitrary determinations of space in itself, at once in a universal rule, we cannot avoid attributing a constitution (eine Natur) to this geometrical thing. Two right lines, for example, which intersect one another and the circle, howsoever they may be drawn, are always divided so that the rectangle constructed with the segments of the one is equal to that constructed with the segments of the other. The question now is: Does this law lie in the circle or in the understanding, that is, Does this figure, independently of the understanding, contain in itself the ground of the law, or does the understanding, having constructed according to its concepts (according to the quality of the radii) the figure itself, introduce into it this law of the chords cutting one another in geometrical proportion? When we follow the proofs of this law, we soon perceive, that it can only be derived

from the condition on which the understanding founds the construction of this figure, and which is that of the equality of the radii. But, if we enlarge this concept, to pursue further the unity of various properties of geometrical figures under common laws, and consider the circle as a conic section, which of course is subject to the same fundamental conditions of construction as other conic sections, we shall find that all the chords which intersect within the ellipse, parabola, and hyperbola, always intersect so that the rectangles of their segments are not indeed equal, but always bear a constant ratio to one another. If we proceed still farther, to the fundamental laws of physical astronomy, we find a physical law of reciprocal attraction diffused over all material nature, the rule of which is: II that it decreases inversely as the square of the distance from each attracting point, i.e., as the spherical surfaces increase, over which this force spreads," which law seems to be necessarily inherent in the very nature of things, and hence is usually propounded as knowable *a priori*. Simple as the sources of this law are, merely resting upon the relation of spherical surfaces of different radii, its consequences are so valuable with regard to the variety of their agreement and its regularity, that not only are all possible orbits of the celestial bodies conic sections, but such a relation of these orbits to each other results, that no other law of attraction, than that of the inverse square of the distance, can be imagined as fit for a cosmical system.

Here accordingly is a nature that rests upon laws which the understanding knows *a priori*, and chiefly from the universal principles of the determination of space. Now I ask: Do the laws of nature lie in space, and does the understanding learn them by merely endeavoring to find out the enormous wealth of meaning that lies in space; or do they inhere in the understanding and in the way in which it determines space according to the conditions of the synthetical unity in which its concepts are all centered?

Space is something so uniform and as to all particular properties so indeterminate, that we should certainly not seek a store of laws of nature in it. Whereas that which determines space to assume the form of a circle or the figures of a cone and a sphere, is the understanding, so far as it contains the ground of the unity of their constructions.

The mere universal form of intuition, called space, must therefore be the substratum of all intuitions determinable to particular objects, and in it of course the condition of the possibility and of the variety of these intuitions lies. But the unity of the objects is entirely determined by the understanding, and on conditions which lie in its own nature; and thus the understanding is the origin of the universal order of nature, in that it comprehends all appearances under its own laws, and thereby first constructs, *a priori*, experience (as to its form), by means of which whatever is to be known only by experience, is necessarily subjected to its laws. For we are not now concerned with the nature of things in themselves, which is independent of the conditions both of our sensibility and our understanding, but with nature, as an object of possible experience, and in this case the understanding, whilst it makes experience possible, thereby insists that the sensuous world is either not an object of experience at all, or must be nature [viz., an existence of things, determined according to universal laws[19]]. APPENDIX TO THE PURE SCIENCE OF NATURE.

Sect. 39. Of the System of the Categories.

There can be nothing more desirable to a philosopher, than to be able to derive the scattered multiplicity of the concepts or the principles, which had occurred to him in concrete use, from a principle *a priori*, and to unite everything in this way in one cognition. He formerly only believed that those things, which remained after a certain abstraction, and seemed by comparison among

one another to constitute a particular kind of cognitions, were completely collected; but this was only an Aggregate. Now he knows, that just so many, neither more nor less, can constitute the mode of cognition, and perceives the necessity of his division, which constitutes comprehension; and now only he has attained a System.

To search in our daily cognition for the concepts, which do not rest upon particular experience, and yet occur in all cognition of experience, where they as it were constitute the mere form of connection, presupposes neither greater reflection nor deeper insight, than to detect in a language the rules of the actual use of words generally, and thus to collect elements for a grammar. In fact both researches are very nearly related, even though we are not able to give a reason why each language has just this and no other formal constitution, and still less why an exact number of such formal determinations in general are found in it.

Aristotle collected ten pure elementary concepts under the name of Categories. [20] To these, which are also called predicaments, [21] he found himself obliged afterwards to add five post-predicaments, some of which however (prius, simul, and molus) are contained in the former; but this random collection must be considered (and commended) as a mere hint for future inquirers, not as a regularly developed idea, and hence it has, in the present more advanced state of philosophy, been rejected as quite useless.

After long reflection on the pure elements of human knowledge (those which contain nothing empirical), I at last succeeded in distinguishing with certainty and in separating the pure elementary notions of the Sensibility (space and time) from those of the Understanding. Thus the 7th, 8th, and 8th Categories had to be excluded from the old list. And the others were of no service to me; because there was no principle [in them], on which the understanding could be investigated, measured in its completion, and all the functions, whence its pure concepts arise, determined exhaustively and with precision.

But in order to discover such a principle, I looked about for an act of the understanding which comprises all the rest, and is distinguished only by various modifications or phases, in reducing the multiplicity of representation to the unity of thinking in general: I found this act of the understanding to consist in judging. Here then the labors of the logicians were ready at hand, though not yet quite free from defects, and with this help I was enabled to exhibit a complete table of the pure functions of the understanding, which are however undetermined in regard to any object. I finally referred these functions of judging to objects in general, or rather to the condition of determining judgments as objectively valid, and so there arose the pure concepts of the understanding, concerning which I could make certain, that these, and this exact number only, constitute our whole cognition of things from pure understanding. I was justified in calling them by their old name, Categories, while I reserved for myself the liberty of adding, under the title of "Predicables," a complete list of all the concepts deducible from them, by combinations whether among themselves, or with the pure form of the appearance, i.e., space or time, or with its matter, so far as it is not yet empirically determined (viz., the object of sensation in general), as soon as a system of transcendental philosophy should be completed with the construction of which I am engaged in the Critique of Pure Reason itself.

Now the essential point in this system of Categories, which distinguishes it from the old rhapsodical collection without any principle, and for which alone it deserves to be considered as philosophy, consists in this: that by means of it the true significance of the pure concepts of the understanding and the condition of their use could be precisely determined. For here it became obvious that they

are themselves nothing but logical functions, and as such do not produce the least concept of an object, but require some sensuous intuition as a basis. They therefore only serve to determine empirical judgments, which are otherwise undetermined and indifferent as regards all functions of judging, relatively to these functions, thereby procuring them universal validity, and by means of them making judgments of experience in general possible.

Such an insight into the nature of the categories, which limits them at the same time to the mere use of experience, never occurred either to their first author, or to any of his successors; but without this insight (which immediately depends upon their derivation or deduction), they are quite useless and only a miserable list of names, without explanation or rule for their use. Had the ancients ever conceived such a notion, doubtless the whole study of the pure rational knowledge, which under the name of metaphysics has for centuries spoiled many a sound mind, would have reached us. in quite another shape, and would have enlightened the human understanding, instead of actually exhausting it in obscure and vain speculations, thereby rendering it unfit for true science.

This system of categories makes all treatment of every object of pure reason itself systematic, and affords a direction or clue how and through what points of inquiry every metaphysical consideration must proceed, in order to be complete; for it exhausts all the possible movements (momenta) of the understanding, among which every concept must be classed. In like manner the table of Principles has been formulated, the completeness of which we can only vouch for by the system of the categories. Even in the division of the concepts, [22] which must go beyond the physical application of the understanding, it is always the very same clue, which, as it must always be determined *a priori* by the same fixed points of the human understanding, always forms a closed circle. There is no doubt that the object of a pure conception either of the understanding or of reason, so far as it is to be estimated philosophically and on *a priori* principles, can in this way be completely known. I could not therefore omit to make use of this clue with regard to one of the most abstract ontological divisions, viz., the various distinctions of "the notions of something and of nothing," and to construct accordingly (Critique, P. 207) a regular and necessary table of their divisions. [23]

And this system, like every other true one founded on a universal principle, shows its inestimable value in this, that it excludes all foreign concepts, which might otherwise intrude among the pure concepts of the understanding, and determines the place of every cognition. Those concepts, which under the name of "concepts of reflection" have been likewise arranged in a table according to the clue of the categories, intrude, without having any privilege or title to be among the pure concepts of the understanding in Ontology. They are concepts of connection, and thereby of the objects themselves, whereas the former are only concepts of a mere comparison of concepts already given, hence of quite another nature and use. By my systematic division[24] they are saved from this confusion. But the value of my special table of the categories will be still more obvious, when we separate the table of the transcendental concepts of Reason from the concepts of the understanding. The latter being of quite another nature and origin, they must have quite another form than the former. This so necessary separation has never yet been made in any system of metaphysics for, as a rule, these rational concepts all mixed up with the categories, like children of one family, which confusion was unavoidable in the absence of a definite system of categories.

Prolegomena

Immanuel Kant
1783

Third Part Of The Main Transcendental Problem. How Is Metaphysics In General Possible?

Sect. 40. Pure mathematics and pure science of nature had no occasion for such a deduction, as we have made of both, for their own safety and certainty. For the former rests upon its own evidence; and the latter (though sprung from pure sources of the understanding) upon experience and its thorough confirmation. Physics cannot altogether refuse and dispense with the testimony of the latter; because with all its certainty, it can never, as philosophy, rival mathematics. Both sciences therefore stood in need of this inquiry, not for themselves, but for the sake of another science, metaphysics.

Metaphysics has to do not only with concepts of nature, which always find their application in experience, but also with pure rational concepts, which never can be given in any possible experience. Consequently the objective reality of these concepts (viz., that they are not mere chimeras), and the truth or falsity of metaphysical assertions, cannot be discovered or confirmed by any experience. This part of metaphysics however is precisely what constitutes its essential end, to which the rest is only a means, and thus this science is in need of such a deduction for its, own sake. The third question now proposed relates therefore as it were to the root and essential difference of metaphysics, i.e., the occupation of Reason with itself, and the supposed knowledge of objects arising immediately from this incubation of its own concepts, without requiring, or indeed being able to reach that knowledge through, experience. [25]

Without solving this problem reason never is justified. The empirical use to which reason limits the pure understanding, does not fully satisfy the proper destination of the latter. Every single experience is only a part of the whole sphere of its domain, but the absolute totality of all possible experience is itself not experience. Yet it is a necessary [concrete] problem for reason, the mere representation of which requires concepts quite different from the categories, whose use is only immanent, or refers to experience, so far as it can be given. Whereas the concepts of reason aim at the completeness, i.e., the collective unity of all possible experience, and thereby transcend every given experience. Thus they become transcendent.

As the understanding stands in need of categories for experience, reason contains in itself the source of ideas, by which I mean necessary concepts, whose object cannot be given in any experience. The latter are inherent in the nature of reason, as the former are in that of the understanding. While the former carry with them an illusion likely to mislead, the illusion of the

latter is inevitable, though it certainly can be kept from misleading us.

Since all illusion consists in holding the subjective ground of our judgments to be objective, a self-knowledge of pure reason in its transcendent (exaggerated) use is the sole preservative from the aberrations into which reason falls when it mistakes its destination, and refers that to the object transcendently, which only regards its own subject and its guidance in all immanent use.

Sect. 41. The distinction of ideas, that is, of pure concepts of reason, from categories, or pure concepts of the understanding, as cognitions of a quite distinct species, origin and use, is so important a point in founding a science which is to contain the system of all these *a priori* cognitions, that without this distinction metaphysics is absolutely impossible, or is at best a random, bungling attempt to build a castle in the air without a knowledge of the materials or of their fitness for any purpose. Had the Critique of Pure Reason done nothing but first point out this distinction, it had thereby contributed more to clear up our conception of, and to guide our inquiry in, the field of metaphysics, than all the vain efforts which have hitherto been made to satisfy the transcendent problems of pure reason, without ever surmising that we were in quite another field than that of the understanding, and hence classing concepts of the understanding and those of reason together, as if they were of the same kind.

Sect. 42. All pure cognitions of the understanding have this feature, that their concepts present themselves in experience, and their principles can be confirmed by it; whereas the transcendent cognitions of reason cannot, either as ideas, appear in experience, -or as propositions ever be confirmed or refuted by it. Hence whatever errors may slip in unawares, can only be discovered by pure reason itself-a discovery of much difficulty, because this very reason naturally becomes dialectical by means of its ideas, and this unavoidable illusion cannot be limited by any objective and dogmatical researches into things, but by a subjective investigation of reason itself as a source of ideas.

Sect. 43. In the Critique of Pure Reason it was always my greatest care to endeavor not only carefully to distinguish the several species of cognition, but to derive concepts belonging to each one of them from their common source. I did this in order that by knowing whence they originated, I might determine their use with safety, and also have the unanticipated but invaluable advantage of knowing the completeness of my enumeration, classification and specification of concepts *a priori*, and therefore according to principles. Without this, metaphysics is mere rhapsody, in which no one knows whether he has enough, or whether and where something is still wanting. We can indeed have this advantage only in pure philosophy, but of this philosophy it constitutes the very essence.

As I had found the origin of the categories in the four logical functions of all the judgments of the understanding, it was quite natural to seek the origin of the ideas in the three functions of the syllogisms of reason. For as soon as these pure concepts of reason (the transcendental ideas) are given, they could hardly, except they be held innate, be found anywhere else, than in the same activity of reason, which, so far as it regards mere form, constitutes the logical element of the syllogisms of reason; but, so far as it represents judgments of the understanding with respect to the one or to the other form *a priori*, constitutes transcendental concepts of pure reason.

The formal distinction of syllogisms renders their division into categorical, hypothetical, and disjunctive necessary. The concepts of reason founded on them contained therefore, first, the idea of the complete subject (the substantial); secondly, the idea of the complete series of conditions; thirdly, the determination of all concepts in the idea of a complete complex of that which is

possible. [26] **The first idea is psychological, the second cosmological, the third theological, and, as all three give occasion to Dialectics, yet each in its own way, the division of the whole Dialects of pure reason into its Paralogism, its Antinomy, and its Ideal, was arranged accordingly. Through this deduction we may feel assured that all the claims of pure reason are completely represented, and that none can be wanting; because the faculty of reason itself, whence they all take their origin, is thereby completely surveyed.**

Sect. 44. In these general considerations it is also remarkable that the ideas of reason are unlike the categories, of no service to the use of our understanding in experience, but quite dispensable, and become even an impediment to the maxims of a rational cognition of nature. Yet in another aspect still to be determined they are necessary. Whether the soul is or is not a simple substance, is of no consequence to us in the explanation of its phenomena. For we cannot render the notion of a simple being intelligible by any possible experience that is sensuous or concrete. The notion is therefore quite void as regards all hoped-for insight into the cause of phenomena, and cannot at all serve as a principle of the explanation of that which internal or external experience supplies. So the cosmological ideas of the beginning of the world or of its eternity (a parte ante) cannot be of any greater service to us for the explanation of any event in the world itself. And finally we must, according to a right maxim of the philosophy of nature, refrain from all explanations of the design of nature, drawn from the will of a Supreme Being; because this would not be natural philosophy, but an acknowledgment that we have come to the end of it. The use of these ideas, therefore, is quite different from that of those categories by which (and by the principles built upon which) experience itself first becomes possible. But our laborious analytics of the understanding would be superfluous if we had nothing else in view than the mere cognition Of nature as it can be given in experience; for reason does its work, both in mathematics and in the science of nature, quite safely and well without any of this subtle deduction. Therefore our Critique of the Understanding combines with the ideas of pure reason for a purpose which lies beyond the empirical use of the understanding; but this we have above declared to be in this aspect totally inadmissible, and without any object or meaning. Yet there must be a harmony between that of the nature of reason and that of the understanding, and the former must contribute to the perfection of the latter, and cannot possibly upset it.

The solution of this question is as follows: Pure reason does not in its ideas point to particular objects, which lie beyond the field of experience, but only requires completeness of the use of the understanding in the system of experience. But this completeness can be a completeness of principles only, not of intuitions [i.e., concrete atsights or *Anschauung*en] and of objects. In order however to represent the ideas definitely, reason conceives them after the fashion of the cognition of an object. The cognition is as far as these rules are concerned completely determined, but the object is only an idea invented for the purpose of bringing the cognition of the understanding as near as possible to the completeness represented by that idea.

Prefatory Remark to the Dialectics of Pure Reason.

Sect. 45. We have above shown in Sect. Sect. 33 and 34 that the purity of the categories from all admixture of sensuous determinations may mislead reason into extending their use, quite beyond all experience, to things in themselves; though as these categories themselves find no intuition which can give them meaning or sense in concrete, they, as mere logical functions, can represent a thing in general, but not give by themselves alone a determinate concept of anything. Such hyperbolical objects are distinguished by the appellation of Noumena, or pure beings of the

understanding (or better, beings of thought), such as, for example, "substance," but conceived without permanence in time, or "cause," but not acting in time, etc. Here predicates, that only serve to make the conformity-to-law of experience possible, are applied to these concepts, and yet they are deprived of all the conditions of intuition, on which alone experience is possible, and so these concepts lose all significance.

There is no danger, however, of the understanding spontaneously making an excursion so very wantonly beyond its own bounds into the field of the mere creatures of thought, without being impelled by foreign laws. But when reason, which cannot be fully satisfied with any empirical use of the rules of the understanding, as being always conditioned, requires a completion of this chain of conditions, then the understanding is forced out of its sphere. And then it partly represents objects of experience in a series so extended that no experience can grasp, partly even (with a view to complete the series) it seeks entirely beyond it noumena, to which it can attach that chain, and so, having at last escaped from the conditions of experience, make its attitude as it were final. These are then the transcendental ideas, which, though according to the true but hidden ends of the natural determination of our reason, they may aim not at extravagant concepts, but at an unbounded extension of their empirical use, yet seduce the understanding by an unavoidable illusion to a transcendent use, which, though deceitful, cannot be restrained within the bounds of experience by any resolution, but only by scientific instruction and with much difficulty.

!. The Psychological Idea. [27]

Sect. 46. People have long since observed, that in all substances the proper subject, that which remains after all the accidents (as predicates) are abstracted, consequently that which forms the substance of things remains unknown, and various complaints have been made concerning these limits to our knowledge. But it will be well to consider that the human understanding is not to be blamed for its inability to know the substance of things, that is, to determine it by itself, but rather for requiring to know it which is a mere idea definitely as though it were a given object. Pure reason requires us to seek for every predicate of a thing its proper subject, and for this subject, which is itself necessarily nothing but a predicate, its subject, and so on indefinitely (or as far as we can reach). But hence it follows, that we must not hold anything, at which we can arrive, to be an ultimate subject, and that substance itself never can be thought by our understanding, however deep we may penetrate, even if all nature were unveiled to us. For the specific nature of our understanding consists in thinking everything discursively, that is, representing it by concepts, and so by mere predicates, to which therefore the absolute subject must always be wanting. Hence all the real properties, by which we know bodies, are mere accidents, not excepting impenetrability, which we can only represent to ourselves as the effect of a power of which the subject is unknown to us.

Now we appear to have this substance in the consciousness of ourselves (in the thinking subject), and indeed in an immediate intuition; for all the predicates of an internal sense refer to the ego, as a subject, and I cannot conceive myself as the predicate of any other subject. Hence completeness in the reference of the given concepts as predicates to a subject -- not merely an idea, but an object-that is, the absolute subject itself, seems to be given in experience. But this expectation is disappointed. For the ego is not a concept, [28] but only the indication of the object of the internal sense, so far as we know it by no further predicate. Consequently it cannot be in itself a predicate of any other thing; but just as little can it be a determinate concept of an absolute subject, but is, as

in all other cases, only the reference of the internal phenomena to their unknown subject. Yet this idea (which serves very well, as a regulative principle, totally to destroy all materialistic explanations of the internal phenomena of the soul) occasions by a very natural misunderstanding a very specious argument, which, from this supposed cognition of the substance of our thinking being, infers its nature, so far as the knowledge of it falls quite without the complex of experience.

Sect. 47. But though we may call this thinking self (the soul) substance, as being the ultimate subject of thinking which cannot be further represented as the predicate of another thing; it remains quite empty and without significance, if permanence- the quality which renders the concept of substances in experience fruitful-cannot be proved of it.

But permanence can never be proved of the concept of a substance, as a thing in itself, but for the purposes of experience only. This is sufficiently shown by the first Analogy of Experience, [29] and whoever will not yield to this proof may try for himself whether he can succeed in proving, from the concept of a subject which does not exist itself as the predicate of another thing, that its existence is thoroughly permanent, and that it cannot either in itself or by any natural cause original or be annihilated. These synthetical *a priori* propositions can never be proved in themselves, but only in reference to things as objects of possible experience.

Sect. 48. If therefore from the concept of the soul as a substance, we would infer its permanence, this can hold good as regards possible experience only, not [of the soul] as a thing in itself and beyond all possible experience. But life is the subjective condition of all our possible experience, consequently we can only infer the permanence of the soul in life; for the death of man is the end of all experience which concerns the soul as an object of experience, except the contrary be proved, which is the very question in hand. The permanence of the soul can therefore only be proved (and no one cares for that) during the life of man, but not, as we desire to do, after death; and for this general reason, that the concept of substance, so far as it is to be considered necessarily combined with the concept of permanence, can be so combined only according to the principles of possible experience, and therefore for the purposes of experience only. [30]

Sect. 49. That there is something real without us which not only corresponds, but must correspond, to our external perceptions, can likewise be proved to be not a connection of things in themselves, but for the sake of experience. This means that there is something empirical, i.e., some phenomenon in space without us, that admits of a satisfactory proof, for we have nothing to do with other objects than those which belong to possible experience; because objects which cannot be given us in any experience, do not exist for us. Empirically without me is that which appears in space, and space, together with all the phenomena which it contains, belongs to the representations, whose connection according to laws of experience proves their objective truth, just as the connection of the phenomena of the internal sense proves the actuality of my soul (as an object of the internal sense). By means of external experience I am conscious of the actuality of bodies, as external phenomena in space, in the same manner as by means of the internal experience I am conscious of the existence of my soul in time, but this soul is only known as an object of the internal sense by phenomena that constitute an internal state, and of which the essence in itself, which forms the basis of these phenomena, is unknown. Cartesian idealism therefore does nothing but distinguish external experience from dreaming; and the conformity to law (as a criterion of its truth) of the former, from the irregularity and the false illusion of the latter. In both it presupposes space and time as conditions of the existence of objects, and it only inquires whether the objects of the external senses, which we when awake put in space, are as actually to be found in it, as the

object of the internal sense, the soul, is in time; that is, whether experience carries with it sure criteria to distinguish it from imagination. This doubt, however, may easily be disposed of, and we always do so in common life by investigating the connection of phenomena in both space and time according to universal laws of experience, and we cannot doubt, when the representation of external things throughout agrees therewith, that they constitute truthful experience. Material idealism, in which phenomena are considered as such only according to their connection in experience, may accordingly be very easily refuted; and it is just as sure an experience, that bodies exist without us (in space), as that I myself exist according to the representation of the internal sense (in time): for the notion without us, only signifies existence in space. However as the Ego in the proposition, III am," means not only the object of internal intuition (in time), but the subject of consciousness, just as body means not only external intuition (in space), but the thing-in-itself, which is the basis of this phenomenon; [as this is the case] the question, whether bodies (as phenomena of the external sense) exist as bodies apart from my thoughts, may without any hesitation be denied in nature. But the question, whether I myself as a phenomenon of the internal sense (the soul according to empirical psychology) exist apart from my faculty of representation in time, is an exactly similar inquiry, and must likewise be answered in the negative. Arid in this manner everything, when it is reduced to its true meaning, is decided and certain. The formal (which I have also called transcendental) actually abolishes the material, or Cartesian, idealism. For if space be nothing but a form of my sensibility, it is as a representation in me just as actual as I myself am, and nothing but the empirical truth of the representations in it remains for consideration. But, if this is not the case, if space and the phenomena in it are something existing without us, then all the criteria of experience beyond our perception can never prove the actuality of these objects without us.

II. The Cosmological Idea. [31]

Sect. 50. This product of pure reason in its transcendent use is its most remarkable curiosity. It serves as a very powerful agent to rouse philosophy from its dogmatic slumber, and to stimulate it to the arduous task of undertaking a Critique of Reason itself.

I term this idea cosmological, because it always takes its object only from the sensible world, and does not use any other than those whose object is given to sense, consequently it remains in this respect in its native home, it does not become transcendent, and is therefore so far not mere idea; whereas, to conceive the soul as a simple substance, -already means to conceive such an object (the simple) as cannot be presented to the senses. Yet the cosmological idea extends the connection of the conditioned with its condition (whether the connection is mathematical or dynamical) so far, that experience never can keep up with it. It is therefore with regard to this point always an idea, whose object never can be adequately given in any experience.

Sect. 51. In the first place, the use of a system of categories becomes here so obvious and unmistakable, that even if there were not several other proofs of it, this alone would sufficiently prove it indispensable in the system of pure reason. There are only four such transcendent ideas, as there are so many classes of categories; in each of which, however, they refer only to the absolute completeness of the series of the conditions for a given conditioned. In analogy to these cosmological ideas there are only four kinds of dialectical assertions of pure reason, which, as they are dialectical, thereby prove, that to each of them, oii equally specious principles of pure reason, a contradictory assertion stands opposed. As all the metaphysical art of the most subtle distinction cannot prevent this opposition, it compels the philosopher to recur to the first sources of pure

reason itself. This Antinomy, not arbitrarily invented, but founded in the nature of human reason, and hence unavoidable and never ceasing, contains the following four theses together with their antitheses:

> **1.**
> **Thesis: The World has, as to, Time and Space, a Beginning (limit).**
> **Antithesis: The World is, as to Time and Space, infinite. 2.**
> **Thesis: Everything in the World consists of [elements that are] simple.**
> **Antithesis: There is nothing simple, but everything is composite.**
> **3.**
> **Thesis: There are in the World Causes through Freedom.**
> **Antithesis: There is no Liberty, but all is Nature.**
> **4.**
> **Thesis: In the Series of the World-Causes there is some necessary Being.**
> **Antithesis: There is Nothing necessary in the World, but in this Series All is incidental.**

Sect. 52. a. Here is the most singular phenomenon of human reason, no other instance of which can be shown in any other use. If we, as is commonly done, represent to ourselves the appearances of the sensible world as things in themselves, if we assume the principles of their combination as principles universally valid of things in themselves and not merely of experience, as is usually, nay without our Critique, unavoidably done, there arises an unexpected conflict, which never can be removed in the common dogmatical way; because the thesis, as well as the antithesis, can be shown by equally clear, evident, and irresistible proofs-for I pledge myself as to the correctness of all these proofs-and reason therefore perceives that it is divided with itself, a state at which the skeptic rejoices, but which must make the critical philosopher pause and feel ill at ease.

Sect. 52. b. We may blunder in various ways in metaphysics without any fear of being detected in falsehood. For we never can be refuted by experience if we but avoid self-contradiction, which in synthetical, though purely fictitious propositions, may be done whenever the concepts, which we connect, are mere ideas, that cannot be given (in their whole content) in experience. For how can we make out by experience, whether the world is from eternity or had a beginning, whether matter is infinitely divisible or consists of simple parts? Such concept cannot be given in any experience, be it ever so extensive, and consequently the falsehood either of the positive or the negative proposition cannot be discovered by this touchstone.

The only possible way in which reason could have revealed unintentionally its secret Dialectics, falsely announced as Dogmatics, would be when it were made to ground an assertion upon a universally admitted principle, and to deduce the exact contrary with the greatest accuracy of inference from another which is equally granted. This is actually here the case with regard to four natural ideas of reason, whence four assertions on the one side, and as many counter-assertions on the other arise, each consistently following from universally-acknowledged principles. Thus they reveal by the use of these principles the dialectical illusion of pure reason which would otherwise forever remain concealed.

This is therefore a decisive experiment, which must necessarily expose any error lying hidden in the assumptions of reason. [32] Contradictory propositions cannot both be false, except the concept, which is the subject of both, is self- contradictory; for example, the propositions, "a square circle is round, and a square circle is not round," are both false. For, as to the former it is false, that the circle is round, because it is quadrangular; and it is likewise false, that it is not round, that is,

angular, because it is a circle. For the logical criterion of the impossibility of a concept consists in this, that if we presuppose it, two contradictory propositions both become false; consequently, as no middle between them is conceivable, nothing at all is thought by that concept.

Sect. 52. c. The first two antinomies, which I call mathematical, because they are concerned with the addition or division of the homogeneous, are founded on such a self- contradictory concept; and hence I explain how it happens, that both the Thesis and Antithesis of the two are false.

When I speak of objects in time and in space, it is not of things in themselves, of which I know nothing, but of things in appearance, that is, of experience, as the particular way of cognising objects which is afforded to man. I must not say of what I think in time or in space, that in itself, and independent of these my thoughts, it exists in space and in time; for in that case I should contradict myself; because space and time, together with the appearances in them, are nothing existing in themselves and outside of my representations, but are themselves only modes of representation, and it is palpably contradictory to say, that a mere mode of representation exists without our representation. Objects of the senses therefore exist only in experience; whereas to give them a self-subsisting existence apart from experience or before it, is merely to represent to ourselves that experience actually exists apart from experience or before it.

Now if I inquire after the quantity of the world, as to space and time, it is equally impossible, as regards all my notions, to declare it infinite or to declare it finite. For neither assertion can be contained in experience, because experience either of an infinite space, or of an infinite time elapsed, or again, of the boundary of the world by a void space, or by an antecedent void time, is impossible; these are mere ideas. This quantity of the world, which is determined in either way, should therefore exist in the world itself apart from all experience. This contradicts the notion of a world of sense, which is merely a complex of the appearances whose existence and connection occur only in our representations, that is, in experience, since this latter is not an object in itself, but a mere mode of representation. Hence it follows, that as the concept of an absolutely existing world of sense is self-contradictory, the solution of the problem concerning its quantity, whether attempted affirmatively or negatively, is always false.

The same holds good of the second antinomy, which relates to the division of phenomena. For these are mere representations, and the parts exist merely in their representation, consequently in the division, or in a possible experience where they are given, and the division reaches only as far as this latter reaches. To assume that an appearance, e.g., that of body, contains in itself before all experience all the parts, which any possible experience can ever reach, is to impute to a mere appearance, which can exist only in experience, an existence previous to experience. In other words, it would mean that mere representations exist before they can be found in our faculty of representation. Such an assertion is self-contradictory, as also every solution of our misunderstood problem, whether we maintain, that bodies in themselves consist of an infinite number of parts, or of a finite number of simple parts.

Sect. 53. In the first (the mathematical) class of antinomies the falsehood of the assumption consists in representing in one concept something self-contradictory as if it were compatible (i.e., an appearance as an object in itself). But, as to the second (the dynamical) class of antinomies, the falsehood of the representation consists in representing as contradictory what is compatible; so that, as in the former case, the opposed assertions are both false, in this case, on the other hand, where they are opposed to one another by mere misunderstanding, they may both be true.

Any mathematical connection necessarily presupposes homogeneity of what is connected (in the

concept of magnitude), while the dynamical one by no means requires the same. When we have to deal with extended magnitudes, all the parts must be homogeneous with one another and with the whole; whereas, in the connection of cause and effect, homogeneity may indeed likewise be found, but is not necessary; for the concept of causality (by means of which something is posited through something else quite different from it), at all events, does not require it.

If the objects of the world of sense are taken for things in themselves, and the above laws of nature for the laws of things in themselves, the contradiction would be unavoidable. So also, if the subject of freedom were, like other objects, represented as mere appearance, the contradiction would be just as unavoidable, for the same predicate would at once be affirmed and denied of the same kind of object in the same sense. But if natural necessity is referred merely to appearances, and freedom merely to things in themselves, no contradiction arises, if we at once assume, or admit both kinds of causality, however difficult or impossible it may be to make the latter kind conceivable.

As appearance every effect is an event, or something that happens in time; it must, according to the universal law of nature, be preceded by a determination of the causality of its cause (a state), which follows according to a constant law. But this determination of the cause as causality must likewise be something that takes place or happens; the cause must have begun to act, otherwise no succession between it and the effect could be conceived. Otherwise the effect, as well as the causality of the cause, would have always existed. Therefore the determination of the cause to act must also have originated among appearances, and must consequently, as well as its effect, be an event, which must again have its cause, and so on; hence natural necessity must be the condition, on which effective causes are determined. Whereas if freedom is to be a property of certain causes of appearances, it must, as regards these, which are events, be a faculty of starting them spontaneously, that is, without the causality of the cause itself, and hence without requiring any other ground to determine its start. But then the cause, as to its causality, must not rank under time-determinations of its state, that is, it cannot be an appearance, and must be considered a thing in itself, while its effects would be only appearances. [33] If without contradiction we can think of the beings of understanding [Verstandeswesen] as exercising such an influence on appearances, then natural necessity will attach to all connections of cause and effect in the .sensuous world, though on the other hand, freedom can be granted to such cause, as is itself not an appearance (but the foundation of appearance). Nature therefore and freedom can without contradiction be attributed to the very same thing, but in different relations-on one side as a phenomenon, on the other as a thing in itself.

We have in us a faculty, which not only stands in connection with its subjective determining grounds that are the natural causes of its actions, and is so far the faculty of a being that itself belongs to appearances, but is also referred to objective grounds, that are only ideas, so far as they can determine this faculty, a connection which is expressed by the word ought. This faculty is called reason, and, so far as we consider a being (man) entirely according to this objectively determinable reason, he cannot be considered as a being of sense, but this property is that of a thing in itself, of which we cannot comprehend the possibility-I mean how the ought (which however has never yet taken place) should determine its activity, and can become the cause of actions, whose effect is an appearance in the sensible world. Yet the causality of reason would be freedom with regard to the effects in the sensuous world, so far as we can consider objective grounds, which are themselves ideas, as their determinants. For its action in that case would not depend upon subjective conditions, consequently not upon those of time, and of course not upon the law of nature, which serves to determine them, because grounds of reason give to actions the

rule universally, according to principles, without the influence of the circumstances of either time or place.

What I adduce here is merely meant as an example to make the thing intelligible, and does not necessarily belong to our problem, which must be decided from mere concepts, independently of the properties which we meet in the actual world.

Now I may say without contradiction: that all the actions of rational beings, so far as they are appearances (occurring in any experience), are subject to the necessity of nature; but the same actions, as regards merely the rational subject and its faculty of acting according to mere reason, are free. For what is required for the necessity of nature? Nothing more than the determinability of every event in the world of sense according to constant laws, that is, a reference to cause in the appearance; in this process the thing in itself at its foundation and its causality remain unknown. But I say, that the law of nature remains, whether the rational being is the cause of the effects in the sensuous world from reason, that is, through freedom, or whether it does not determine them on grounds of reason. For, if the former is the case, the action is performed according to maxims, the effect of which as appearance is always conformable to constant laws; if the latter is the case, and the action not performed on principles of reason, it is subjected to the empirical laws of the sensibility, and in both cases the effects are connected according to constant laws; more than this we do not require or know concerning natural necessity. But in the former case reason is the cause of these laws of nature, and therefore free; in the latter the effects follow according to mere natural laws of sensibility, because reason does not influence it; but reason itself is not determined on that account by the sensibility, and is therefore free in this case too. Freedom is therefore no hindrance to natural law in appearance, neither does this law abrogate the freedom of the practical use of reason, which is connected with things in themselves, as determining grounds.

Thus practical freedom, viz., the freedom in which reason possesses causality according to objectively determining grounds, is rescued and yet natural necessity is not in the least curtailed with regard to the very same effects, as appearances. The same remarks will serve to explain what we had to say concerning transcendental freedom and its compatibility with natural necessity (in the same subject, but not taken in the same reference). For, as to this, every beginning of the action of a being from objective causes regarded as determining grounds, is always a first start, though the same action is in the series of appearances only a subordinate start, which must be preceded by a state of the cause, which determines it, and is itself determined in the same manner by another immediately preceding. Thus we are able, in rational beings, or in beings generally, so far as their causality is determined in them as things in themselves, to imagine a faculty of beginning from itself a series of states, without falling into contradiction with the laws of nature. For the relation of the action to objective grounds of reason is not a time-relation; in this case that which determines the causality does not precede in time the action, because such determining grounds represent not a reference to objects of sense, e.g., to causes in the appearances, but to determining causes, as things in themselves, which do not rank under conditions of time. And in this way the action, with regard to the causality of reason, can be considered as a first start in respect to the series of appearances, and yet also as a merely subordinate beginning. We may therefore without contradiction consider it in the former aspect as free, but in the latter (in so far as it is merely appearance) as subject to natural necessity.

As to the fourth Antinomy, it is solved in the same way as the conflict of reason with itself in the third. For, provided the cause in the appearance is distinguished from the cause of the appearance (so far as it can be thought as a thing in itself), both propositions are perfectly reconcilable: the

one, that there is nowhere in the sensuous world a cause (according to similar laws of causality), whose existence is absolutely necessary; the other, that this world is nevertheless connected with a Necessary Being as its cause (but of another kind and according to another law). The incompatibility of these propositions entirely rests upon the mistake of extending what is valid merely of appearances to things in themselves, and in general confusing both in one concept.

Sect. 54. This then is the proposition and this the solution of the whole antinomy, in which reason finds itself involved in the application of its principles to the sensible world. The former alone (the mere proposition) would be a considerable service in the cause of our knowledge of human reason, even though the solution might fail to fully satisfy the reader, who has here to combat a natural illusion, which has been but recently exposed to him, and which he had hitherto always regarded as genuine. For one result at least is unavoidable. As it is quite impossible to prevent this conflict of reason with itself-so long as the objects of the sensible world are taken for things in themselves, and not for mere appearances, which they are in fact-the reader is thereby compelled to examine over again the deduction of all our *a priori* cognition and the proof which I have given of my deduction in order to come to a decision on the question. This is all I require at present; for when in this occupation he shall have thought himself deep enough into the nature of pure reason, those concepts by which alone the solution of the conflict of reason is possible, will become sufficiently familiar to him. Without this preparation I cannot expect an unreserved assent even from the most attentive reader.

III. The Theological Idea. [34]

Sect. 55. The third transcendental Idea, which affords matter for the most important, but, if pursued only speculatively, transcendent and thereby dialectical use of reason, is the ideal of pure reason. Reason in this case does not, as with the psychological and the cosmological Ideas, begin from experience, and err by exaggerating its grounds, in striving to attain, if possible, the absolute completeness of their series. It rather totally breaks with experience, and from mere concepts of what constitutes the absolute completeness of a thing in general, consequently by means of the idea of a most perfect primal Being, it proceeds to determine the possibility and therefore the actuality of all other things. And so the mere presupposition of a Being, who is conceived not in the series of experience, yet for the purposes of experience-for the sake of comprehending its connection, order, and unity -i.e., the idea [the notion of it], is more easily distinguished from the concept of the understanding here, than in the former cases. Hence we can easily expose the dialectical illusion which arises from our making the subjective conditions of our thinking objective conditions of objects themselves, and an hypothesis necessary for the satisfaction of our reason, a dogma. As the observations of the Critique on the pretensions of transcendental theology are intelligible, clear, and decisive, I have nothing more to add on the subject.

General Remark on the Transcendental Ideas.

Sect. 56. The objects, which are given us by experience, are in many respects incomprehensible, and many questions, to which the law of nature leads us, when carried beyond a certain point (though quite conformably to the laws of nature), admit of no answer; as for example the question: why substances attract one another? But if we entirely quit nature, or in pursuing its combinations, exceed all possible experience, and so enter the realm of mere ideas, we cannot then say that the object is incomprehensible, and that the nature of things proposes to us insoluble

problems. For we are not then concerned with nature or in general with given objects, but with concepts, which have their origin merely in our reason, and with mere creations of thought; and all the problems that arise from our notions of them must be solved, because of course reason can and must give a full account of its own procedure. [35] As the psychological, cosmological, and theological Ideas are nothing but pure concepts of reason, which cannot be given in any experience, the questions which reason asks us about them are put to us not by the objects, but by mere maxims of our reason for the sake of its own satisfaction. They must all be capable of satisfactory answers, which is done by showing that they are principles which bring our use of the understanding into thorough agreement, completeness, and synthetical unity, and that they so far hold good of experience only, but of experience as a whole.

Although an absolute whole of experience is impossible, the idea of a whole of cognition according to principles must impart to our knowledge a peculiar kind of unity, that of a system, without which it is nothing but piecework, and cannot be used for proving the existence of a highest purpose (which can only be the general system of all purposes), I do not here refer only to the practical, but also to the highest purpose of the speculative use of reason.

The transcendental Ideas therefore express the peculiar application of reason as a principle of systematic unity in the use of the understanding. Yet if we assume this unity of the mode of cognition to be attached to the object of cognition, if we regard that which is merely regulative to be constitutive, and if we persuade ourselves that we can by means of these Ideas enlarge our cognition transcendently, or far beyond all possible experience, while it only serves to render experience within itself as nearly complete as possible, i.e., to limit its progress by nothing that cannot belong to experience: we suffer from a mere misunderstanding in our estimate of the proper application of our reason and of its principles, and from a Dialectic, which both confuses the empirical use of reason, and also sets reason at variance with itself.

Conclusion: On The Determination Of The Bounds Of Pure Reason.

Sect. 57. Having adduced the clearest arguments, it would be absurd for us to hope that we can know more of any object, than belongs to the possible experience of it, or lay claim to the least atom of knowledge about anything not assumed to be an object of possible experience, which would determine it according to the constitution it has in itself. For how could we determine anything in this way, since time, space, and the categories, and still more all the concepts formed by empirical experience or perception in the sensible world [*Anschauung*], have and can have no other use, than to make experience possible. And if this condition is omitted from the pure concepts of the understanding, they do not determine any object, and have no meaning whatever.

But it would be on the other hand a still greater absurdity if we conceded no things in themselves, or set up our experience for the only possible mode of knowing things, our way of beholding [*Anschauung*] them in space and in time for the only possible way, and our discursive understanding for the archetype of every possible understanding; in fact if we wished to have the principles of the possibility of experience considered universal conditions of things in themselves.

Our principles, which limit the use of reason to possible experience, might in this way become transcendent, and the limits of our reason be set up as limits of the possibility of things in themselves (as Hume's dialogues may illustrate), if a careful critique did not guard the bounds of our reason with respect to its empirical use, and set a limit to its pretensions. Skepticism originally arose from metaphysics and its licentious dialectics. At first it might, merely to favor the empirical use of reason, announce everything that transcends this use as worthless and deceitful; but by and by, when it was perceived that the very same principles that are used in experience, insensibly, and apparently with the same right, led still further than experience extends, then men began to doubt even the propositions of experience. But here there is no danger; for common sense will doubtless always assert its rights. A certain confusion, however, arose in science which cannot determine how far reason is to be trusted, and why only so far and no further, and this confusion can only be cleared up and all future relapses obviated by a formal determination, on principle, of the boundary of the use of our reason.

We cannot indeed, beyond all possible experience, form a definite notion of what things in themselves may be. Yet we are not at liberty to abstain entirely from inquiring into them; for experience never satisfies reason fully, but in answering questions, refers us further and further back, and leaves us dissatisfied with regard to their complete solution. This any one may gather

from the Dialectics of pure reason, which therefore has its good subjective grounds. Having acquired, as regards the nature of our soul, a clear conception of the subject, and having come to the conviction, that its manifestations cannot be explained materialistically, who can refrain from asking what the soul really is, and, if no concept of experience suffices for the purpose, from accounting for it by a concept of reason (that of a simple immaterial being), though we cannot by any means prove its objective reality? Who can satisfy himself with mere empirical knowledge in all the cosmological questions of the duration and of the quantity of the world, of freedom or of natural necessity, since every answer given on principles of experience begets a fresh question, which likewise requires its answer and thereby clearly shows the insufficiency of all physical modes of explanation to satisfy reason? Finally, who does not see in the thoroughgoing contingency and dependence of all his thoughts and assumptions on mere principles of experience, the impossibility of stopping there? And who does not feel himself compelled, notwithstanding all interdictions against losing himself in transcendent ideas, to seek rest and contentment beyond all the concepts which he can vindicate by experience, in the concept of a Being, the possibility of which we cannot conceive, but at the same time cannot be refuted, because it relates to a mere being of the understanding, and without it reason must needs remain forever dissatisfied?

Bounds (in extended beings) always presuppose a space existing outside a certain definite place, and enclosing it; limits do not require this, but are mere negations, which affect a quantity, so far as it is not absolutely complete. But our reason, as it were, sees in its surroundings a space for the cognition of things in themselves, though we can never have definite notions of them, and are limited to appearances only.

As long as the cognition of reason is homogeneous, definite bounds to it are inconceivable. In mathematics and in natural philosophy human reason admits of limits but not of bounds, viz., that something indeed lies without it, at which it can never arrive, but not that it will at any point find completion in its internal progress. The enlarging of our views in mathematics, and the possibility of new discoveries, are infinite; and the same is the case with the discovery of new properties of nature, of new powers and laws, by continued experience and its rational combination. But limits cannot be mistaken here, for mathematics refers to appearances only, and what cannot be an object of sensuous contemplation, such as the concepts of metaphysics and of morals, lies entirely without its sphere, and it can never lead to them; neither does it require them. It is therefore not a continual progress and an approximation towards these sciences, and there is not, as it were, any point or line of contact. Natural science will never reveal to us the internal constitution of things, which though not appearance, yet can serve as the ultimate ground of explaining appearance. Nor does that science require this for its physical explanations. Nay even if such grounds should be offered from other sources (for instance, the influence of immaterial beings), they must be rejected and not used in the progress of its explanations. For these explanations must only be grounded upon that which as an object of sense can belong to experience, and be brought into connection with our actual perceptions and empirical laws.

But metaphysics leads us towards bounds in the dialectical attempts of pure reason (not undertaken arbitrarily or wantonly, but stimulated thereto by the nature of reason itself). And the transcendental Ideas, as they do not admit of evasion, and are never capable of realization, serve to point out to us actually not only the bounds of the pure use of reason, but also the way to determine them. Such is the end and the use of this natural predisposition of our reason, which has brought forth metaphysics as its favorite child, whose generation, like every other in the world, is not to be ascribed to blind chance, but to an original germ, wisely organized for great ends. For

metaphysics, in its fundamental features, perhaps more than any other science, is placed in us by nature itself, and cannot be considered the production of an arbitrary choice or a casual enlargement in the progress of experience from which it is quite disparate.

Reason with all its concepts and laws of the understanding, which suffice for empirical use, i.e., within the sensible world, finds in itself no satisfaction because ever-recurring questions deprive us of all hope of their complete solution. The transcendental ideas, which have that completion in view, are such problems of reason. But it sees clearly, that the sensuous world cannot contain this completion, neither consequently can all the concepts, which serve merely for understanding the world of sense, such as space and time, and whatever we have adduced under the name of pure concepts of the understanding. The sensuous world is nothing but a chain of appearances connected according to universal laws; it has therefore no subsistence by itself; it is not the thing in itself, and consequently must point to that which contains the basis of this experience, to beings which cannot be known merely as phenomena, but as things in themselves. In the cognition of them alone reason can hope to satisfy its desire of completeness in proceeding from the conditioned to its conditions.

We have above (Sects. 33, 34) indicated the limits of reason with regard to all cognition of mere creations of thought. Now, since the transcendental ideas have urged us to approach them, and thus have led us, as it were, to the spot where the occupied space (viz., experience) touches the void (that of which we can know nothing, viz., noumena), we can determine the bounds of pure reason. For in all bounds there is something positive (e.g., a surface is the boundary of corporeal space, and is therefore itself a space, a line is a space, which is the boundary of the surface, a point the boundary of the line, but yet always a place in space), whereas limits contain mere negations. The limits pointed out in those paragraphs are not enough after we have discovered that beyond them there still lies something (though we can never know what it is in itself). For the question now is, What is the attitude of our reason in this connection of what we know with what we do not, and never shall, know? This is an actual connection of a known thing with one quite unknown (and which will always remain so), and though what is unknown should not become the least more known-which we cannot even hope-yet the notion of this connection must be definite, and capable of being rendered distinct.

We must therefore accept an immaterial being, a world of understanding, and a Supreme Being (all mere noumena), because in them only, as things in themselves, reason finds that completion and satisfaction, which it can never hope for in the derivation of appearances from their homogeneous grounds, and because these actually have reference to something distinct from them (and totally heterogeneous), as appearances always presuppose an object in itself, and therefore suggest its existence whether we can know more of it or not.

But as we can never know these beings of understanding as they are in themselves, that is, definitely, yet must assume them as regards the sensible world, and connect them with it by reason, we are at least able to think this connection by means of such concepts as express their relation to the world of sense. Yet if we represent to ourselves a being of the understanding by nothing but pure concepts of the understanding, we then indeed represent nothing definite to ourselves, consequently our concept has no significance; but if we think it by properties borrowed from the sensuous world, it is no longer a being of understanding, but is conceived as an appearance, and belongs to the sensible world. Let us take an instance from the notion of the Supreme Being.

Our deistic conception is quite a pure concept of reason, but represents only a thing containing all

realities, without being able to determine any one of them; because for that purpose an example must be taken from the world of sense, in which case we should have an object of sense only, not something quite heterogeneous, which can never be an object of sense. Suppose I attribute to the Supreme Being understanding, for instance; I have no concept of an understanding other than my own, one that must receive its perceptions [*Anschauung*] by the senses, and which is occupied in bringing them under rules of the unity of consciousness. Then the elements of my concept would always lie in the appearance; I should however by the insufficiency of the appearance be necessitated to go beyond them to the concept of a being which neither depends upon appearance, nor is bound up with them as conditions of its determination. But if I separate understanding from sensibility to obtain a pure understanding, then nothing remains but the mere form of thinking without perception [*Anschauung*], by which form alone I can know nothing definite, and consequently no object. For that purpose I should conceive another understanding, such as would directly perceive its objects, [36] but of which I have not the least notion; because the human understanding is discursive, and can [not directly perceive, it can] only know by means of general concepts. And the very same difficulties arise if we attribute a will to the Supreme Being; for we have this concept only by drawing it from our internal experience, and therefore from our dependence for satisfaction upon objects whose existence we require; and so the notion rests upon sensibility, which is absolutely incompatible with the pure concept of the Supreme Being.

Hume's objections to deism are weak, and affect only the proofs, and not the deistic assertion itself. But as regards theism, which depends on a stricter determination of the concept of the Supreme Being which in deism is merely transcendent, they are very strong, and as this concept is formed, in certain (in fact in all common) cases irrefutable. Hume always insists, that by the mere concept of an original being, to which we apply only ontological predicates (eternity, omnipresence, omnipotence), we think nothing definite, and that properties which can yield a concept in concrete must be superadded; that it is not enough to say, it is Cause, but we must explain the nature of its causality, for example, that of an understanding and of a will. He then begins his attacks on the essential point itself, i.e., theism, as he; had previously directed his battery only against the proofs of deism, an attack which is not very dangerous to it in its consequences. All his dangerous arguments refer to anthropomorphism, which he holds to be inseparable from theism, and to make it absurd in itself; but if the former be abandoned, the latter must vanish with it, and nothing remain but deism, of which nothing can come, which is of no value, and which cannot serve as any foundation to religion or morals. If this anthropomorphism were really unavoidable, no proofs whatever of the existence of a Supreme Being, even were they all granted, could determine for us the concept of this Being without involving us in contradictions.

If we connect with the command to avoid all transcendent judgments of pure reason, the command (which apparently conflicts with it) to proceed to concepts that lie beyond the field of its immanent (empirical) use, we discover that both can subsist together, but only at the boundary of all lawful use of reason. For this boundary belongs as well to the field of experience, as to that of the creations of thought, and we are thereby taught, as well, bow these so remarkable ideas serve merely for marking the bounds of human reason. On the one hand they give warning not boundlessly to extend cognition of experience, as if nothing but world[37] I remained for us to know, and yet, on the other hand, not to transgress the bounds of experience, and to think of judging about things beyond them, as things in themselves.

But we stop at this boundary if we limit our judgment merely to the relation which the world may have to a Being whose very concept lies beyond all the knowledge which we can attain within the

world. For we then do not attribute to the Supreme Being any of the properties in themselves, by which we represent objects of experience, and thereby avoid dogmatic anthropomorphism; but we attribute them to his relation to the world, and allow ourselves a symbolical anthropomorphism, which in fact concerns language only, and not the object itself.

If I say that we are compelled to consider the world, as if it were the work of a Supreme Understanding and Will, I really say nothing more, than that a watch, a ship, a regiment, bears the same relation to the watchmaker, the shipbuilder, the commanding officer, as the world of sense (or whatever constitutes the substratum of this complex of appearances) does to the Unknown, which I do not hereby know as it is in itself, but as it is for me or in relation to the world, of which I am a part.

Sect. 58. Such a cognition is one of analogy, and does not signify (as is commonly understood) an imperfect similarity of two things, but a perfect similarity of relations between two quite dissimilar things. [38] By means of this analogy, however, there remains a concept of the Supreme Being sufficiently determined for us, though we have left out everything that could determine it absolutely or in itself; for we determine it as regards the world and as regards ourselves, and more do we not require. The attacks which Hume makes upon those who would determine this concept absolutely, by taking the materials for so doing from themselves and the world, do not affect us; and he cannot object to us, that we have nothing left if we give up the objective anthropomorphism of the concept of the Supreme Being.

For let us assume at the outset (as Hume in his dialogues makes Philo grant Cleanthes), as a necessary hypothesis, the deistical concept of the First Being, in which this Being is thought by the mere ontological predicates of substance, of cause, etc. This must be done, because reason, actuated in the sensible world by mere conditions, which are themselves always conditional, cannot otherwise have any satisfaction, and it therefore can be done without falling into anthropomorphism (which transfers predicates from the world of sense to a Being quite distinct from the world), because those predicates are mere categories, which, though they do not give a determinate concept of God, yet give a concept not limited to any conditions of sensibility. Thus nothing can prevent our predicating of this Being a causality through reason with regard to the world, and thus passing to theism, without being obliged to attribute to God in himself this kind of reason, as a property inhering in him. For as to the former, the only possible way of prosecuting the use of reason (as regards all possible experience, in complete harmony with itself) in the world of sense to the highest point, is to assume a supreme reason as a cause of all the connections in the world. Such a principle must be quite advantageous to reason and can hurt it nowhere in its application to nature. As to the latter, reason is thereby not transferred as a property to the First Being in himself, but only to his relation to the world of sense, and so anthropomorphism is entirely avoided. For nothing is considered here but the cause of the form of reason which is perceived everywhere in the world, and reason is attributed to the Supreme Being, so far as it contains the ground of this form of reason in the world, but according to analogy only, that is, so far as this expression shows merely the relation, which the Supreme Cause unknown to us has to the world, in order to determine everything in it conformably to reason in the highest degree. We are thereby kept from using reason as an attribute for the purpose of conceiving God, but instead of conceiving the world in such a manner as is necessary to have the greatest possible use of reason according to principle. We thereby acknowledge that the Supreme Being is quite inscrutable and even unthinkable in any definite way as to what he is in himself. We are thereby kept, on the one band, from making a transcendent use of the concepts which we have of reason as an efficient

cause (by means of the will), in order to determine the Divine Nature by properties, which are only borrowed from human nature, and from losing ourselves in gross and extravagant notions, and on the other hand from deluging the contemplation of the world with hyperphysical modes of explanation according to our notions of human reason, which we transfer to God, and so losing for this contemplation its proper application, according to which it should be a rational study of mere nature, and not a presumptuous derivation of its appearances from a Supreme Reason. The expression suited to our feeble notions is, that we conceive the world as if it came, as to its existence and internal plan, from a Supreme Reason, by which notion we both know the constitution, which belongs to the world itself, yet without pretending to determine the nature of its cause in itself, and on the other hand, we transfer the ground of this constitution (of the form of reason in the world) upon the relation of the Supreme Cause to the world, without finding the world sufficient by itself for that purpose. [39]

Thus the difficulties which seem to oppose theism -disappear by combining with Hume's principle -- "not to carry the use of reason dogmatically beyond the field of all possible experience" -- this other principle, which be quite overlooked: "not to consider the field of experience as one which bounds itself in the eye of our reason." The Critique of Pure Reason here points out the true mean between dogmatism, which Hume combats, and skepticism, which he would substitute for it-a mean which is not like other means that we find advisable to determine for ourselves as it were mechanically (by adopting something from one side and something from the other), and by which nobody is taught a better way, but such a one as can be accurately determined on principles.

Sect. 59. At the beginning of this annotation I made use of the metaphor of a boundary, in order to establish the limits of reason in regard to its suitable use. The world of sense contains merely appearances, which are not things in themselves, but the understanding must assume these latter ones, viz., noumena. In our reason both are comprised, and the question is, How does reason proceed to set boundaries to the understanding as regards both these fields? Experience, which contains all that belongs to the sensuous world, does not bound itself; it only proceeds in every case from the conditioned to some other equally conditioned object. Its boundary must lie quite without it, and this field is that of the pure beings of the understanding. But this field, so far as the determination of the nature of these beings is concerned, is an empty space for us, and if dogmatically- determined concepts alone are in question, we cannot pass out of the field of possible experience. But as a boundary itself is something positive, which belongs as well to that which lies within, as to the space that lies without the given complex, it is still an actual positive cognition, which reason only acquires by enlarging itself to this boundary, yet without attempting to pass it; because it there finds itself in the presence of an empty space, in which it can conceive forms of things, but not things themselves. But the setting of a boundary to the field of the understanding by something, which is otherwise unknown to it, is still a cognition which belongs to reason even at this standpoint, and by which it is neither confined within the sensible, nor straying without it, but only refers, as befits the knowledge of a boundary, to the relation between that which lies without it, and that which is contained within it.

Natural theology is such a concept at the boundary of human reason, being constrained to look beyond this boundary to the Idea of a Supreme Being (and, for practical purposes to that of an intelligible world also), not in order to determine anything relatively to this pure creation of the understanding, which lies beyond the world of sense, but in order to guide the use of reason within it according to principles of the greatest possible (theoretical as well as practical) unity. For this purpose we make use of the reference of the world of sense to an independent reason, as the cause

of all its connections. Thereby we do not purely invent a being, but, as beyond the sensible. world there must be something that can only be thought by the pure understanding, we determine that something in this particular way, though only of course according to analogy.

And thus there remains our original proposition, which is the resume of the whole Critique: "that reason by all its *a priori* principles never teaches us anything more than objects of possible experience, and even of these nothing more than can be known in experience." But this limitation does not prevent reason leading us to the objective boundary of experience, viz., to the reference to something which is not itself an object of experience, but is the ground of all experience. Reason does not however teach us anything concerning the thing in itself: it only instructs us as regards its own complete and highest use in the field of possible experience. But this is all that can be reasonably desired in the present case, and with which we have cause to be satisfied.

Sect. 60. Thus we have fully exhibited metaphysics as 'it is actually given in the natural predisposition of human reason, and in that which constitutes the essential end of its pursuit, according to its subjective possibility. Though we have found, that this merely natural use of such a predisposition of our reason, if no discipline arising only from a scientific critique bridles and sets limits to it, involves us in transcendent, either apparently or really conflicting, dialectical syllogisms; and this fallacious metaphysics is not only unnecessary as regards the promotion of our knowledge of nature, but even disadvantageous to it: there yet remains a problem worthy of solution, which is to find out the natural ends intended by this disposition to transcendent concepts in our reason, because everything that lies in nature must be originally intended for some useful purpose.

Such an inquiry is of a doubtful nature; and I .acknowledge, that what I can say about it is conjecture only, like every speculation about the first ends of nature. The question does not concern the objective validity of metaphysical judgments, but our natural predisposition to them, and therefore does not belong to the system of metaphysics but to anthropology.

When I compare all the transcendental Ideas, the totality of which constitutes the particular problem of natural pure reason, compelling it to quit the mere contemplation of nature, to transcend all possible experience, and in this endeavor to produce the thing (be it knowledge or fiction) called metaphysics, I think I perceive that the aim of this natural tendency is, to free our notions from the fetters of experience and from the limits of the mere contemplation of nature so far as at least to open to us a field containing mere objects for the pure understanding, which no sensibility can reach, not indeed for the purpose of speculatively occupying ourselves with them (for there we can find no ground to stand on), but because practical principles, which, without finding some such scope for their necessary expectation and hope, could not expand to the universality which reason unavoidably requires from a moral point of view.

So I find that the Psychological Idea (however little it may reveal to me the nature of the human soul, which is higher than all concepts of experience), shows the insufficiency of these concepts plainly enough, and thereby deters me from materialism, the psychological notion of which is unfit for any explanation of nature, and besides confines reason in practical respects. The Cosmological Ideas, by the obvious insufficiency of all possible cognition of nature to satisfy reason in its lawful inquiry, serve in the same manner to keep us from naturalism, which asserts nature to be sufficient for itself. Finally, all natural necessity in the sensible world is conditional, as it always presupposes the dependence of things upon others, and unconditional necessity must be sought only in the unity of a cause different from the world of sense. But as the causality of this cause, in its turn, were it

merely nature, could never render the existence of the contingent (as its consequent) comprehensible, reason frees itself by means of the Theological Idea from fatalism, (both as a blind natural necessity in the coherence of nature itself, without a first principle, and as a blind causality of this principle itself), and leads to the concept of a cause possessing freedom, or of a Supreme Intelligence. Thus the transcendental Ideas serve, if not to instruct us positively, at least to destroy the rash assertions of Materialism, of Naturalism, and of Fatalism, and thus to afford scope for the moral Ideas beyond the field of speculation. These considerations, I should think, explain in some measure the natural predisposition of which I spoke.

The practical value, which a merely speculative science may have, lies without the bounds of this science, and can therefore be considered as a scholion merely, and like all scholia does not form part of the science itself. This application however surely lies within the bounds of philosophy, especially of philosophy drawn from the pure sources of reason, where its speculative use in metaphysics must necessarily be at unity with its practical use in morals. Hence the unavoidable dialectics of pure reason, considered in metaphysics, as a natural tendency, deserves to be explained not as an illusion merely, which is to be removed, but also, if possible, as a natural provision as regards its end, though this duty, a work of supererogation, cannot justly be assigned to metaphysics proper.

The solutions of these questions which are treated in the chapter on the Regulative Use of the Ideas of Pure Reason[40] should be considered a second scholion which however has a greater affinity with the subject of metaphysics. For there certain rational principles are expounded which determine *a priori* the order of nature or rather of the understanding, which seeks nature's laws through experience. They seem to be constitutive and legislative with regard to experience, though they spring from pure reason, which cannot be considered, like the understanding, as a principle of possible experience. Now whether or not this harmony rests upon the fact, that just as nature does not inhere in appearances or in their source (the sensibility) itself, but only in so far as the latter is in relation to the understanding, as also a systematic unity in applying the understanding to bring about an entirety of all possible experience can only belong to the understanding when in relation to reason; and whether or not experience is in this way mediately subordinate to the legislation of reason: may be discussed by those who desire to trace the nature of reason even beyond its use in metaphysics, into the general principles of a history of nature; I have represented this task as important, but not attempted its solution, in the book itself. [41]

And thus I conclude the analytical solution of the main question which I had proposed: How is metaphysics in general possible? by ascending from the data of its actual use in its consequences, to the grounds of its possibility.

Prolegomena

Immanuel Kant
1783

Solution Of The General Question Of The Prolegomena: "How Is Metaphysics Possible As A Science?"

Metaphysics, as a natural disposition of reason, is actual, but if considered by itself alone (as the analytical solution of the third principal question showed), dialectical and illusory. If we think of taking principles from it, and in using them follow the natural, but on that account not less false, illusion, we can never produce science, but only a vain dialectical art, in which one school may outdo another, but none can ever acquire a just and lasting approbation.

In order that as a science metaphysics may be entitled to claim not mere fallacious plausibility, but insight and conviction, a Critique of Reason must itself exhibit the whole stock of *a priori* concepts, their division according to their various sources (Sensibility, Understanding, and Reason), together with a complete table of them, the analysis of all these concepts, with all their consequences, especially by means of the deduction of these concepts, the possibility of synthetical cognition *a priori*, the principles of its application and finally its bounds, all in a complete system. Critique, therefore, and critique alone, contains in itself the whole well- proved and well-tested plan, and even all the means required to accomplish metaphysics, as a science; by other ways and means it is impossible. The question here therefore is not so much how this performance is possible, as how to set it going, and induce men of clear heads to quit their hitherto perverted and fruitless cultivation for one that will not deceive, and how such a union for the common end may best be directed.

This much is certain, that whoever has once tasted Critique will be ever after disgusted with all dogmatical twaddle which be formerly put up with, because his reason must have something, and could find nothing better for its support.

Critique stands in the same relation to the common metaphysics of the schools, as chemistry does to alchemy, or as astronomy to the astrology of the fortune-teller. I pledge myself that nobody who has read through and through, and grasped the principles of, the Critique even in these Prolegomena only, will ever return to that old and sophistical pseudo-science; but will rather with a certain delight look forward to metaphysics which is now indeed in his power, requiring no more preparatory discoveries, and now at last affording permanent satisfaction to reason. For here is an advantage upon which, of all possible sciences, metaphysics alone can with certainty reckon: that it can be brought to such completion and fixity as to be incapable of further change, or of any augmentation by new discoveries; because here reason has the sources of its knowledge in itself,

not in objects and their observation [*Anschauung*], by which latter its stock of knowledge cannot be further increased. When therefore it has exhibited the fundamental laws of its faculty completely and so definitely as to avoid all misunderstanding, there remains nothing for pure reason to know *a priori*, nay, there is even no ground to raise further questions. The sure prospect of knowledge so definite and so compact has a peculiar charm, even though we should set aside all its advantages, of which I shall hereafter speak.

All false art, all vain wisdom, lasts its time, but finally destroys itself, and its highest culture is also the epoch of its decay. That this time is come for metaphysics appears from the state into which it has fallen among all learned nations, despite of all the zeal with which other sciences of every kind are prosecuted. The old arrangement of our university studies still preserves its shadow; now and then an Academy of Science tempts men by offering prizes to write essays on it, but it is no longer numbered among thorough sciences; and let any one judge for himself how a man of genius, if he were called a great metaphysician, would receive the compliment, which may be well- meant, but is scarce envied by anybody.

Yet, though the period of the downfall of all dogmatical metaphysics has undoubtedly arrived, we are yet far from being able to say that the period of its regeneration is come by means of a thorough and complete Critique of Reason. All transitions from a tendency to its contrary pass through the stage of indifference, and this moment is the most dangerous for an author, but, in my opinion, the most favorable for the science. For, when party spirit has died out by a total dissolution of former connections, minds are in the best state to listen to several proposals for an organization according to a new plan.

When I say, that I hope these Prolegomena will excite investigation in the field of critique and afford a new and promising object to sustain the general spirit of philosophy, which seems on its speculative side to want sustenance, I can imagine beforehand, that every one, whom the thorny paths of my Critique have tired and put out of humor, will ask me, upon what I found this hope. My answer is, upon the irresistible law of necessity.

That the human mind will ever give up metaphysical researches is as little to be expected as that we should prefer to give up breathing altogether, to avoid inhaling impure air. There will therefore always be metaphysics in the world; nay, every one, especially every man of reflection, will have it, and for want of a recognized standard, will shape it for himself after his own pattern. What has hitherto been called metaphysics, cannot satisfy any critical mind, but to forego it entirely is impossible; therefore a Critique of Pure Reason itself must now be attempted or, if one exists, investigated, and brought to the full test, because there is no other means of supplying this pressing want, which is something more than mere thirst for knowledge.

Ever since I have come to know critique, whenever I finish reading a book of metaphysical contents, which, by the preciseness of its notions, by variety, order, and an easy style, was not only entertaining but also helpful, I cannot help asking, 11 Has this author indeed advanced metaphysics a single step?" The learned men, whose works have been useful to me in other respects and always contributed to the culture of my mental powers, will, I hope, forgive me for saying, that I have never been able to find either their essays or my own less important ones (though self-love may recommend them to me) to have advanced the science of metaphysics in the least, and why?

Here is the very obvious reason: metaphysics did not then exist as a science, nor can it be gathered piecemeal, but its germ must be fully preformed in the Critique. But in order to prevent all

misconception, we must remember what has been already said, that by the analytical treatment of our concepts the understanding gains indeed a great deal, but the science (of metaphysics) is thereby not in the least advanced, because these dissections of concepts are nothing but the materials from which the intention is to carpenter our science. Let the concepts of substance and of accident be ever so well dissected and determined, all this is very well as a preparation for some future use. But if we cannot prove, that in all which exists the substance endures, and only the accidents vary, our science is not the least advanced by all our analyzes.

Metaphysics has hitherto never been able to prove *a priori* either this proposition, or that of sufficient reason, still less any more complex theorem, such as belongs to psychology or cosmology, or indeed any synthetical proposition. By all its analyzing therefore nothing is affected, nothing obtained or forwarded and the science, after all this bustle and noise, still remains as it was in the days of Aristotle, though far better preparations were made for it than of old, if the clue to synthetical cognitions had only been discovered.

If any one thinks himself offended, he is at liberty to refute my charge by producing a single synthetical proposition belonging to metaphysics, which he would prove dogmatically *a priori*, for until he has actually performed this feat, I shall not grant that he has truly advanced the science; even should this proposition be sufficiently confirmed by common experience. No demand can be more moderate or more equitable, and in the (inevitably certain) event of its non-performance, no assertion more just, than that hitherto metaphysics has never existed as a science.

But there are two things which, in case the challenge be accepted, I must deprecate: first, trifling about probability and conjecture, which are suit-d as little to metaphysics, as to geometry; and secondly, a decision by means of the magic wand of common sense, which does not convince every one, but which accommodates itself to personal peculiarities.

For as to the former, nothing can be more absurd, than in metaphysics, a philosophy from pure reason to think of grounding our judgments upon probability and conjecture. Everything that is to be known *a priori*, is thereby announced as apodictically certain, and must therefore be proved in this way. We might as well think of grounding geometry or arithmetic upon conjectures. As to the doctrine of chances in the latter, it does not contain probable, but perfectly certain, judgments concerning the degree of the probability of certain cases, under given uniform conditions, which, in the sum of all possible cases, infallibly happen according to the rule, though it is not sufficiently determined in respect to every single chance. Conjectures (by means of induction and of analogy) can be suffered in an empirical science of nature only, yet even there the possibility at least of what we assume must be quite certain.

The appeal to common sense is even more absurd, when concept and principles are announced as valid, not in so far as they hold with regard to experience, but even beyond the conditions of experience. For what is common sense? It is normal good sense, so far it judges right. But what is normal good sense? It is the faculty of the knowledge and use of rules in concreto, as distinguished from the speculative understanding, which is a faculty of knowing rules in abstracto. Common sense can hardly understand the rule, 11 that every event is determined by means of its cause," and can never comprehend it thus generally. It therefore demands an example from experience, and when it hears that this rule means nothing but what it always thought when a pane was broken or a kitchen-utensil missing, it then understands the principle and grants it. Common sense therefore is only of use so far as it can see its rules (though they actually are *a priori*) confirmed by experience; consequently to comprehend them *a priori*, or independently of experience, belongs to

the speculative understanding, and lies quite beyond the horizon of common sense. But the province of metaphysics is entirely confined to the latter kind of knowledge, and it is certainly a bad index of common sense to appeal to it as a witness, for it cannot here form any opinion whatever, and men look down upon it with contempt until they are in difficulties, and can find in their speculation neither in nor out.

It is a common subterfuge of those false friends of common sense (who occasionally prize it highly, but usually despise it) to say, that there must surely be at all events some propositions which are immediately certain, and of which there is no occasion to give any proof, or even any account at all, because we otherwise could never stop inquiring into the grounds of our judgments. But if we except the principle of contradiction, which is not sufficient to show the truth of synthetical judgments, they can never adduce, in proof of this privilege, anything else indubitable, which they can immediately ascribe to common sense, except mathematical propositions, such as twice two make four, between two points there is but one straight line, etc. But these judgments are radically different from those of metaphysics. For in mathematics I myself can by thinking construct whatever I represent to myself as possible by a concept: I add to the first two the other two, one by one, and myself make the number four, or I draw in thought from one point to another all manner of lines, equal as well as unequal; yet I can draw one only, which is like itself in all its parts. But I cannot, by all my power of thinking, extract from the concept of a thing the concept of something else, whose existence is necessarily connected with the former, but I must call in experience. And though my understanding furnishes me *a priori* (yet only in reference to possible experience) with the concept of such a connection (i.e., causation), I cannot exhibit it, like the concepts of mathematics, by [*Anschauung*] visualizing them, *a priori*, and so show its possibility *a priori*. This concept, together with the principles of its application, always requires, if it shall hold *a priori* as is requisite in metaphysics -a justification and deduction of its possibility, because we cannot otherwise know how far it holds good, and whether it can be used in experience only or beyond it also.

Therefore in metaphysics, as a speculative science of pure reason, we can never appeal to common sense, but may do so only when we are forced to surrender it, and to renounce all purely speculative cognition, which must always be knowledge, and consequently when we forego metaphysics itself and its instruction, for the sake of adopting a rational faith which alone may be possible for us, and sufficient to our wants, perhaps even more salutary than knowledge itself. For in this case the attitude of the question is quite altered. Metaphysics must be science, not only as a whole, but in all its parts, otherwise it is nothing; because, as a speculation of pure reason, it finds a hold only on general opinions. Beyond its field, however, probability and common sense may be used with advantage and justly, but on quite special principles, of which the importance always depends on the reference to practical life.

This is what I hold myself justified in requiring for the possibility of metaphysics as a science.

Prolegomena

Immanuel Kant
1783

Appendix: On What Can Be Done To Make Metaphysics Actual As A Science.

Since all the ways heretofore taken have failed to attain the goal, and since without a preceding critique of pure reason it is not likely ever to be attained, the present essay now before the public has a fair title to an accurate and careful investigation, except it be thought more advisable to give up all pretensions to metaphysics, to which, if men but would consistently adhere to their purpose, no objection can be made.

If we take the course of things as it is, not as it ought to be, there are two sorts of judgments: (1) one a judgment which precedes investigation (in our case one in which the reader from his own metaphysics pronounces judgment on the Critique of Pure Reason which was intended to discuss the very possibility of metaphysics); (2) the other a judgment subsequent to investigation. In the latter the reader is enabled to waive for awhile the consequences of the critical researches that may be repugnant to his formerly adopted metaphysics, and first examines the grounds whence those consequences are derived. If what common metaphysics propounds were demonstrably certain, as for instance the theorems of geometry, the former way of judging would bold good. For if the consequences of certain principles are repugnant to established truths, these principles are false and without further inquiry to be repudiated. But if metaphysics does not possess a stock of indisputably certain (synthetical) propositions, and should it even be the case that there are a number of them, which, though among the most specious, are by their consequences in mutual collision, and if no sure criterion of the truth of peculiarly metaphysical (synthetical) propositions is to be met with in it, then the former way of judging is not admissible, but the investigation of the principles of the critique must precede all judgments as to its value.

On A Specimen Of A Judgment Of The Critique Prior To Its Examination.

This judgment is to be found in the Gottingischen gelehrten Anzeigen, in the supplement to the third division, of January 19, 1782, pages 40 et seq.

When an author who is familiar with the subject of his work and endeavors to present his independent reflections in its elaboration, falls into the hands of a reviewer who in his turn, is keen enough to discern the points on which the worth or worthlessness of the book rests, who does not cling to words, but goes to the heart of the subject, sifting and testing more than the mere principles which the author takes as his point of departure, the severity of the judgment may

indeed displease the latter, but the public does not care, as it gains thereby; and the author himself may be contented, as an opportunity of correcting or explaining his positions is afforded to him at an early date by the examination of a competent judge, in such a manner, that if he believes himself fundamentally right, he can remove in time any stone of offense that might hurt the success of his work.

I find myself, with my reviewer, in quite another position. He seems not to see at all the real matter of the investigation with which (successfully or unsuccessfully) I have been occupied. It is either impatience at thinking out a lengthy work, or vexation at a threatened reform of a science in which he believed he had brought everything to perfection long ago, or, what I am unwilling to imagine, real narrow-mindedness, that prevents him from ever carrying his thoughts beyond his school-metaphysics. In short, he passes impatiently in review a long series of propositions, by which, without knowing their premises, we can think nothing, intersperses here and there his censure, the reason of which the reader understands just as little as the propositions against which it is directed; and hence [his report] can neither serve the public nor damage me, in the judgment of experts. I should, for these reasons, have passed over this judgment altogether, were it not that it may afford me occasion for some explanations which may in some cases save the readers of these Prolegomena from a misconception.

In order to take a position from which my reviewer could most easily set the whole work in a most unfavorable light, without venturing to trouble himself with any special investigation, he begins and ends by saying: "This work is a system of transcendent (or, as he translates it, of higher) Idealism." [42]

A glance at this line soon showed me the sort of criticism that I had to expect, much as though the reviewer were one who had never seen or heard of geometry, having found a Euclid, and coming upon various figures in turning over its leaves, were to say, on being asked his opinion of it: "The work is a text-book of drawing; the author introduces a peculiar terminology, in order to give dark, incomprehensible directions, which in the end teach nothing more than what every one can effect by a fair natural accuracy of eye, etc."

Let us see, in the meantime, what sort of an idealism it is that goes through my whole work, although it does not by a long way constitute the soul of the system.

The dictum of all genuine idealists from the Eleatic school to Bishop Berkeley, is contained in this formula: "All cognition through the senses and experience is nothing but sheer illusion, and only, in the ideas of the pure understanding and reason there is truth."

The principle that throughout dominates and determines my Idealism, is on the contrary: "All cognition of things merely from pure understanding or pure reason is nothing but sheer illusion, and only in experience is there truth."

But this is directly contrary to idealism proper. How came I then to use this expression for quite an opposite purpose, and how came my reviewer to see it everywhere?

The solution of this difficulty rests on something that could have been very easily understood from the general bearing of the work, if the reader had only desired to do so. Space and time, together with all that they contain, are not things nor qualities in themselves, but belong merely to the appearances of the latter: up to this point I am one in confession with the above idealists. But these, and amongst them more particularly Berkeley, regarded space as a mere empirical presentation that, like the phenomenon it contains, is only known to us by means of experience or perception,

together with its determinations. I, on the contrary, prove in the first place, that space (and also time, which Berkeley did not consider) and all its determinations *a priori*, can be known by us, because, no less than time, it inheres in our sensibility as a pure form before all perception or experience and makes all intuition of the same, and therefore all its phenomena, possible. It follows from this, that as truth rests on universal and necessary laws as its criteria, experience, according to Berkeley, can have no criteria of truth, because its phenomena (according to him) have nothing *a priori* at their foundation; whence it follows, that they are nothing but sheer illusion; whereas with us, space and time (in conjunction with the pure conceptions of the understanding) prescribe their law to all possible experience *a priori*, and at the same time afford the certain criterion for distinguishing truth from illusion therein. [43]

My so-called (properly critical) Idealism is of quite a special character, in that it subverts the ordinary idealism, and that through it all cognition *a priori*, even that of geometry, first receives objective reality, which, without my demonstrated ideality of space and time, could not be maintained by the most zealous realists. This being the state of the case, I could have wished, in order to avoid all misunderstanding, to have named this conception of mine otherwise, but to alter it altogether was impossible. It may be permitted me however, in future, as has been above intimated, to term it the formal, or better still, the critical Idealism, to distinguish it from the dogmatic Idealism of Berkeley, and from the skeptical Idealism of Descartes.

Beyond this, I find nothing further remarkable in the judgment of my book. The reviewer criticizes here and there, makes sweeping criticisms, a mode prudently chosen, since it does not betray one's own knowledge or ignorance; a single thorough criticism in detail, had it touched the main question, as is only fair, would have exposed, it may be my error, or it may be my reviewer's measure of insight into this species of research. It was, moreover, not a badly conceived plan, in order at once to take from readers (who are accustomed to form their conceptions of books from newspaper reports) the desire to read the book itself, to pour out in one breath a number of passages in succession, torn from their connection, and their grounds of proof and explanations, and which must necessarily sound senseless, especially considering how antipathetic they are to all school-metaphysics; to exhaust the reader's patience ad nauseam, and then, after having made me acquainted with the sensible proposition that persistent illusion is truth, to conclude with the crude paternal moralization: to what end, then, the quarrel with accepted language, to what end, and whence, the idealistic distinction? A judgment which seeks all that is characteristic of my book, first supposed to be metaphysically heterodox, in a mere innovation of the nomenclature, proves clearly that my would-be judge has understood nothing of the subject, and in addition, has not understood himself. [44]

My reviewer speaks like a man who is conscious of important and superior insight which he keeps hidden; for I am aware of nothing recent with respect to metaphysics that could justify his tone. But he should not withhold his discoveries from the world, for there are doubtless many who, like myself, have not been able to find in all the fine things that have for long past been written in this department, anything that has advanced the science by so much as a finger-breadth; we find indeed the giving a new point to definitions, the supplying of lame proofs with new crutches, the adding to the crazy-quilt of metaphysics fresh patches or changing its pattern; but all this is not what the world requires. The world is tired of metaphysical assertions; it wants the possibility of the science, the sources from which certainty therein can be derived, and certain criteria by which it may distinguish the dialectical illusion of pure reason from truth. To this the critic seems to possess a key, otherwise he would never have spoken out in such a high tone.

But I am inclined to suspect that no such requirement of the science has ever entered his thoughts, for in that case he would have directed his judgment to this point, and even a mistaken atteriipt in such an important matter, would have won his respect. If that be the case, we are once more good friends. He may penetrate as deeply as he likes into metaphysics, without any one hindering him; only as concerns that which lies outside metaphysics, its sources, which are to be found in reason, he cannot form a judgment. That my suspicion is not without foundation, is proved by the fact that he does not mention a word about the possibility of synthetic knowledge *a priori*, the special problem upon the solution of which the fate of metaphysics wholly rests, and upon which my Critique (as well as the present Prolegomena) entirely hinges. The Idealism he encountered, and which he hung upon,: was only taken up in the doctrine as the sole means of solving the above problem (although it received its confirmation on other grounds), and hence he must have shown either that the above problem does not possess the importance I attribute to it (even in these Prolegomena), or that by my conception of appearances, it is either not solved at all, or can be better solved in another way; but I do not find a word of this in the criticism. The reviewer, then, understands nothing of my work, and possibly also nothing of the spirit and essential nature of metaphysics itself; and it is not, what I would rather assume, the hurry of a man incensed at the labor of plodding through so many obstacles, that threw an unfavorable shadow over the work lying before him, and made its fundamental features unrecognizable.

There is a good deal to be done before a learned journal, it matters not with what care its writers may be selected, can maintain its otherwise well-merited reputation, in the field of metaphysics as elsewhere. Other sciences and branches of knowledge have their standard. Mathematics has it, in itself; history and theology, in profane or sacred books; natural science and the art of medicine, in mathematics and experience; jurisprudence, in law books; and even matters of taste in the examples of the ancients. But for the judgment of the thing called metaphysics, the standard has yet to be found. I have made an attempt to determine it, as well as its use. What is to be done, then, until it be found, when works of this kind have to be judged of? If they are of a dogmatic character, -one may do what one likes; no one will play the master over others here for long, before some one else appears to deal with him in the same manner. If, however, they are critical in their character, not indeed with reference to other works, but to reason itself, so that the standard of judgment cannot be assumed but has first of all to be sought for, then, though objection and blame may indeed be permitted, yet a certain degree of leniency is indispensable, since the need is common to us all, and the lack of the necessary insight makes the high-handed attitude of judge unwarranted.

In order, however, to connect my defense with the interest of the philosophical commonwealth, I propose a test, which must be decisive as to the mode, whereby all metaphysical investigations may be directed to their common purpose. This is nothing more than what formerly mathematicians have done, in establishing the advantage of their methods by competition. I challenge my critic to demonstrate, as is only just, on *a priori* grounds, in his way, a single really metaphysical principle asserted by him. Being metaphysical it must be synthetic and known *a priori* from conceptions, but it may also be any one of the most indispensable principles, as for instance, the principle of the persistence of substance, or of the necessary determination of events in the world by their causes. If he cannot do this (silence however is confession), he must admit, that as metaphysics without apodictic certainty of propositions of this kind is nothing at all, its possibility or impossibility must before all things be established in a critique of the pure reason. Thus he is bound either to confess that my principles in the Critique are correct, or he must prove their invalidity. But as I can already foresee, that, confidently as he has hitherto relied on the certainty of his principles, when it

comes to a strict test he will not find a single one in the whole range of metaphysics he can bring forward, I will concede to him an advantageous condition, which can only be expected in such a competition, and will relieve him of the onus probandi by laying it on myself.

He finds in these Prolegomena and in my Critique (chapter on the "Theses and Antitheses Antinomies") eight propositions, of which two and two contradict one another, but each of which necessarily belongs to metaphysics, by which it must either be accepted or rejected (although there is not one that has not in this time been held by some philosopher). Now he has the liberty of selecting any one of these eight propositions at his pleasure, and accepting it without any proof, of which I shall make him a present, but only one (for waste of time will be just as little serviceable to him as to me), and then of attacking my proof of the opposite proposition. If I can save this one, and at the same time show, that according to principles which every dogmatic metaphysics must necessarily recognize, the opposite of the proposition adopted by him can be just as clearly proved, it is thereby established that metaphysics has an hereditary failing, not to be explained, much less set aside, until we ascend to its birth-place, pure reason itself, and thus my Critique must either be accepted or a better one take its place; it must at least be studied, which is the only thing I now require. If, on the other hand, I cannot save my demonstration, then a synthetic proposition *a priori* from dogmatic principles is to be reckoned to the score of my opponent, then also I will deem my impeachment of ordinary metaphysics as unjust, and pledge myself to recognize his stricture on my Critique as justified (although this would not be the consequence by a long way). To this end it would be necessary, it seems to me, that he should step out of his incognito. Otherwise I do not see how it could be avoided, that instead of dealing with one, I should be honored by several problems coming from anonymous and unqualified opponents.

Proposals As To An Investigation Of The Critique Upon Which A Judgment May Follow.

I feel obliged to the honored public even for the silence with which it for a long time favored my Critique, for this proves at least a postponement of judgment, and some supposition that in a work, leaving all beaten tracks and striking out on a new path, in which one cannot at once perhaps so easily find one's way, something may perchance lie, from which an important but at present dead branch of human knowledge may derive new life and productiveness. Hence may have originated a solicitude for the as yet tender shoot, lest it be destroyed by a hasty judgment. A test of a judgment, delayed for the above reasons, is now before my eye in the Gothaischen gelehrten Zeitung, the thoroughness of which every reader will himself perceive, from the clear and unperverted presentation of a fragment of one of the first principles of my work, without taking into consideration my own suspicious praise.

And now I propose, since an extensive structure cannot be judged of as a whole from a hurried glance, to test it piece by piece from its foundations, so thereby the present Prolegomena may fitly be used as a general outline with which the work itself may occasionally be compared. This notion, if it were founded on nothing more than my conceit of importance, such as vanity commonly attributes to one's own productions, would be immodest and would deserve to be repudiated with disgust. But now, the interests of speculative philosophy have arrived at the point of total extinction, while human reason hangs upon them with inextinguishable affection, and only after having been ceaselessly deceived does it vainly attempt to change this into indifference.

In our thinking age it is not to be supposed but that many deserving men would use any good

opportunity of working for the common interest of the more and more enlightened reason, if there were only some hope of attaining the goal. Mathematics, natural science, laws, arts, even morality, etc., do not completely fill the soul; there is always a space left over, reserved for pure and speculative reason, the vacuity of which prompts us to seek in vagaries, buffooneries, and mysticism for what seems to be employment and entertainment, but what actually is mere pastime; in order to deaden the troublesome voice of reason, which in accordance with its nature requires something that can satisfy it, and not merely subserve other ends or the interests of our inclinations. A consideration, therefore, which is concerned only with reason as it exists for it itself, has as I may reasonably suppose a great fascination for every one who has attempted thus to extend his conceptions, and I may even say a greater than any other theoretical branch of knowledge, for which he would not willingly exchange it, because here all other cognitions, and even purposes, must meet and unite themselves in a whole. [45]

I offer, therefore, these Prolegomena as a sketch and text- book for this investigation, and not the work itself. Although I am even now perfectly satisfied with the latter as far as contents, order, and mode of presentation, and the care that I have expended in weighing and testing every sentence before writing it down, are concerned (for it has taken me years to satisfy myself fully, not only as regards the whole but in some cases even as to the sources of one particular proposition); yet I am not quite satisfied with my exposition in some sections of the doctrine of elements, as for instance in the deduction of the conceptions of the Understanding, or in that on the paralogisms of pure reason, because a certain diffuseness takes away from their clearness, and in place of them, what is here said in the Prolegomena respecting these sections, may be made the basis of the test.

It is the boast of the Germans that where steady and continuous industry are requisite, they can carry things farther than other nations. If this opinion be well founded, an opportunity, a business, presents itself, the successful issue of which we can scarcely doubt, and in which all thinking men can equally take part, though they have hitherto been unsuccessful in accomplishing it and in thus confirming the above good opinion. But this is chiefly because the science in question is of so peculiar a kind, that it can be at once brought to completion and to that enduring state that it will never be able to be brought in the least degree farther or increased by later discoveries, or even changed (leaving here out of account adornment by greater clearness in some places, or additional uses), and this is an advantage no other science has or can have, because there is none so fully isolated and independent of others, and which is concerned with the faculty of cognition pure and simple. And the present moment seems, moreover, not to be unfavorable to my expectation, for just now, in Germany, no one seems to know wherewith to occupy himself, apart from the so-called useful sciences, so as to pursue not mere play, but a business possessing an enduring purpose.

To discover the means how the endeavors of the learned may be united in such a purpose, I must leave to others. In the meantime, it is my intention to persuade any one merely to follow my propositions, or even to flatter me with the hope that he will do so; but attacks, repetitions, limitations, or confirmation, completion, and extension, as the case may be, should be appended. If the matter be but investigated from its foundation, it cannot fail that a system, albeit not my own, shall be erected, that shall be a possession for future generations for which they may have reason to be grateful.

It would lead us too far here to show what kind of metaphysics may be expected, when only the principles of criticism have been perfected, and how, because the old false feathers have been pulled out, she need by no means appear poor and reduced to an insignificant figure, but may be in

other respects richly and respectably adorned. But other and great uses which would result from such a reform, strike one immediately. The ordinary metaphysics had its uses, in that it sought out the elementary conceptions of the pure understanding in order to make them clear through analysis, and definite by explanation. In this way it was a training for reason, in whatever direction it might be turned; but this was all the good it did; service was subsequently effaced when it favored conceit by venturesome assertions, sophistry by subtle distinctions and adornment, and shallowness by the ease with which it decided the most difficult problems by means of a little school-wisdom, which is only the more seductive the more it has the choice, on the one hand, of taking something from the language of science, and on the other from that of popular discourse, thus being everything to everybody, but in reality nothing at all. By criticism, however, a standard is given to our judgment, whereby knowledge may be with certainty distinguished from pseudo-science, and firmly founded, being brought into full operation in metaphysics; a mode of thought extending by degrees its beneficial influence over every other use of reason, at once infusing into it the true philosophical spirit. But the service also that metaphysics performs for theology, by making it independent of the judgment of dogmatic speculation, thereby assuring it completely against the attacks of all such opponents, is certainly not to be valued lightly. For ordinary metaphysics, although it promised the latter much advantage, could not keep this promise, and moreover, by summoning speculative dogmatics to its assistance, did nothing but arm enemies against itself. Mysticism, which can prosper in a rationalistic age only when it hides itself behind a system of school-metaphysics, under the protection of which it may venture to rave with a semblance of rationality, is driven from this, its last hiding-place, by critical philosophy. Last, but not least, it cannot be otherwise than important to a teacher of metaphysics, to be able to say with universal assent, that what he expounds is Science, and that thereby genuine services will be rendered to the commonweal.

Prolegomena

Immanuel Kant
1783

Notes

[2] Says Horace: " Rusticus expectat, dum defluat amnis, at ille Labitur et labetur in omne volubilis aevum; " A rustic fellow waiteth on the shore For the river to flow away, But the river flows, and flows on as before, And it flows forever and aye."

[3] Nevertheless Hume called this very destructive science metaphysics and attached to it great value. "Metaphysics and morals" he declares "are the most important branches of science; mathematics and physics are not nearly so important" ["On the Rise and Progress of Arts and Sciences," Essays, Moral, Political, and Literary]. But the acute man merely regarded the negative use arising from the moderation of extravagant claims of speculative reason, and the complete settlement of the many endless and troublesome controversies that mislead mankind. He overlooked the positive injury which results, if reason be deprived of its most important prospects, which can alone supply to the will the highest aim for all its endeavor.

[4] [The term *Anschauung* here used means sense-perception. It is that which is given to the senses and apprehended Immediately, as an object is seen by merely looking at it. The translation intuiition, though etymologically correct, is misleading. In the present passage the term is not used in its technical significance but means " practical experience."-Ed.]

[5] [The term apodictic is borrowed by Kant from Aristotle who uses it in the sense of "certain beyond dispute." The word is derived from [Greek] (= I show) and is contrasted to dialectic propositions, i. e., such statements " admit of controversy. -- Ed.]

[6] It is unavoidable that as knowledge advances, certain expressions which have become classical, after having been used since the infancy: of science, will be found inadequate and unsuitable, and a newer and more appropriate application of the terms will give rise to confusion. [This is the case with the term " analytical."] The analytical method, so far as it is opposed to the synthetical, is very different from that which constitutes the essence of analytical propositions: it signifies only that we start from what is sought, as if it were given, and ascend to the only

conditions under which it is possible. In this method we often use nothing but synthetical propositions, as in mathematical analysis, and it were better to term it the regressive method, in contradistinction to the synthetic or progressive. A principal part of Logic too is distinguished by the name of Analytics, which here signifies the logic of truth in contrast to Dialectics, without considering whether the cognitions belonging to it are analytical or synthetical.

[7] [This whole paragraph (Sect. 9) will be better understood when compared with Remark I., following this section. - Ed.]

[8] [Empirical judgments (emfiirische Urtheile) are either mere statements of fact, viz.. records of a perception, or statements of a natural law, implying a causal connection between two facts. The former Kant calls" judgments of perception" (Wahrnehmungsurtheile), the latter "judgments of experience " (Erfahrungsurtheile).-Ed.]

[9] I freely grant that these examples do not represent such judgments of perception as ever could become judgments of experience, even though a concept of the understanding were superadded, because they refer merely to feeling, which everybody knows to be merely subjective, and which of course can never be attributed to the object, and consequently never become objective. I only wished to give here an example of a judgment that is merely subjectively valid, containing no ground for universal validity, and thereby for a relation to the object. An example of the judgments of perception, which become judgments of experience by superadded concepts of the understanding, will be given in the next note.

[10] As an easier example, we may take the following: " When the sun shines on the stone, it grows warm." This judgment, however often I and others may have perceived it, is a mere judgment of perception, and contains no necessity; perceptions are only usually conjoined in this manner. But if I say, "The sun warms the stone," I add to the perception a concept of the understanding, viz., that of cause, which connects with the concept of sunshine that of heat as a necessary consequence, and the synthetical judgment becomes of necessity universally valid, viz., objective, and is converted from a perception into experience.

[11] This name seems preferable to the term particularia, which is used for these judgments in logic. For the latter implies the idea that they are not universal. But when I start from unity (in single judgments) and so proceed to universality, I must not [even indirectly and negatively] imply any reference to universality. I think plurality merely without universality, and not the exception from universality. This is necessary, if logical considerations shall form the basis of the pure concepts of the understanding. However, there is no need of making changes in logic.

[12] But how does this proposition, 11 that judgments of experience contain necessity in the synthesis of perceptions," agree with my statement so often before inculcated, that "experience as cognition *a posteriori* can afford contingent judgments only? "When I say that experience teaches me something, I mean only the perception that lies in experience,- for example, that heat always follows the shining of the sun on a stone; consequently the proposition of experience is always so far accidental. That this heat necessarily follows the shining of the sun is contained indeed in the judgment of experience (by means of the concept of cause), yet is a fact not learned by experience; for conversely, experience is first of all generated by this addition of the concept of the understanding (of cause) to perception. How perception attains this addition may be seen by referring in the Critique itself to the section on the Transcendental faculty of Judgment Lviz-, in the first edition, Vex dem Schematismxs der Taxes Verstandsbegrirel.

13 [Kant uses the term physiological in its etymological meaning as "pertaining to the science of physics," i.e., nature in general, not as we use the term now as "pertaining to the functions of the living body." Accordingly it has been translated "physical." -- Ed.]

14 The three following paragraphs will hardly be understood unless reference be made to what the Citique itself says on the subject of the Principles; they will, however, be of service in giving a general view of the Principles, and in fixing the attention of the main points.

15 [Kant uses here the equivocal term Wechsetwirkung. --Ed.]

16 Heat and light are in a small space just as large as to degree as in a large one; in like manner the internal representations, pain, consciousness in general, whether they last a short or a long time, need not vary as to the degree. Hence the quantity is here in a point and in a moment just as great as in any space or time however great. Degrees are therefore capable of increase, but not in intuition, rather in mere sensation (or the quantity of the degree of an intuition). Hence they can only be estimated quantitatively by the relation of 1 to 0, viz, by their capability of decreasing by infinite intermediate degrees to disappearance, or of increasing from naught through infinite gradations to a determinate sensation in a certain time. Quantitas qualitatis est gradus [i.e., the degrees of quality must be measured by equality.]

17 We speak of the "intelligible world," not (as the usual expression is) "intellectual world." For cognitions are intellectual through the understanding, and refer to our world of sense also; but objects, so far as they can be represented merely by the understanding, and to which none of our sensible intuitions can refer, are termed " intelligible." But as some possible intuition must correspond to every object, we would have to assume an understanding that intuits things immediately; but of such we have not the least notion, nor have we of the things of the understanding [Verstandes wasen], to which it should be applied.

18 Crusius alone thought of a compromise: that a Spirit, who can neither err nor deceive, implanted these laws in us originally. But since false principles often intrude themselves, as indeed the very system of this man shows in not a few examples, we are involved ill difficulties as to the use of such a principle in the absence of sure criteria to distinguish the genuine origin from the spurious as we never can know certainly what the Spirit of truth or the father of lies may have instilled into us.

19 The definition of nature is given in the beginning of the Second Part of the " Transcendental Problem," in Sect. 14.

20 1. Substantia, 2. Qualitas 3, Quamtitas, 4. Relatio, 5. Actio, 6. Passio, 7. Quando, 8. Ubi, 9. Situs, 10. Habitus.

21 Oppositum, Prius, Simul, Motus, Habere.

22 See the two tables in the chapters Von den Paralogismen der reinen Verunft and the first division of the Antinomy of Pure Reason, System der kosmologischen Ideen.

23 On the table of the categories many neat observations may be made, for instance (1) that the third arises from the first and the second joined in one concept (2) that in those of Quantity and of Quality there is merely a progress from unity to totality or from something to nothing (for this purpose the categories of Quality must stand thus: reality, limitation, total negation), without correlata or opposita, whereas those of Relation and of Modality have them; (3) that, as in Logic categorical judgments are the basis of all others, so the category of Substance is the basis of all

concepts of actual things; (4) that as Modality in the judgment is not a particular predicate, so by the modal concepts a determination is not superadded to things, etc., etc. Such observations are of great use. If we besides enumerate all the predicables, which we can find pretty completely in any good ontology (for example, Baumgarten's), and arrange them in classes under the categories, in which operation we must not neglect to add as complete a dissection of all these concepts as possible, there will then arise a merely analytical part of metaphysics, which does not contain a single synthetical proposition. which might precede the second (the synthetical), and would by its precision and completeness be not only useful, but, in virtue of its system, be even to some extent elegant.

24 See Critique of Pure Reason, Von der Amphibolie der Reflexbergriffe.

25 If we can say, that a science is actual at least in the idea of all men, as soon as it appears that the problems which lead to it are proposed to everybody by the nature of human reason, and that therefore many (though faulty) endeavors are unavoidably made in its behalf, then we are bound to Fay that metaphysics is subjectively (and indeed necessarily) actual, and therefore we justly ask, how is it (objectively) possible.

26 In disjunctive judgments we consider all possibility as divided in respect to a particular concept. By the ontological principle of the universal determination of a thing in general, I understand the principle that either the one or the other of all possible contradictory predicates must be assigned to any object. This is at the same time the principle of all disjunctive judgments, constituting the foundation of our conception of possibility, and in it the possibility of every object in general is considered as determined. This may serve as a slight explanation of the above proposition: that the activity of reason in disjunctive syllogisms is formally the same as that by which it fashions the idea of a universal conception of all reality, containing in itself that which is positive in all contradictory predicates.

27 See Critique of Pure Reason, Von ded Paralogismen der reinen Verunft.

28 Were the representation of the apperception (the Ego) a concept, by which anything could be thought, it could be used as a predicate 'of other things or contain predicates in itself. But it is nothing more than the feeling of an existence without the least definite conception and is only the representation of that to which all thinking stands in relation (relative accidentis).

29 Cf. Critique, Von den Analogien der Erfahrung.

30 It is indeed very remarkable how carelessly metaphysicians have always passed over the principle of the permanents of substances without ever attempting a proof of it; doubtless because they found themselves abandoned by all proofs as soon as they began to deal with the concept of substance. Common sense, which felt distinctly that without this presupposition no union of perceptions in experience is possible, supplied the want by a postulate. From experience itself it never could derive such a principle, partly because substances cannot be so traced in all their alterations and dissolutions, that the matter can always be found undiminished, partly because the principle contains Necessity. which is always the sign of an *a priori* principle. People then boldly applied this postulate to the concept of soul as a substance, and concluded a necessary continuance of the soul after the death of man (especially as the simplicity of this substance, which is interred from the indivisibility of consciousness, secured it from destruction by dissolution). Had they found the genuine source of this principles discovery which requires deeper researches than they were ever inclined to make -- they would have seen, that the law of the permanence of substances has

place for the purposes of experience only, and hence can hold good of things so far as they are to be known and conjoined with others in experience, but never independently of all possible experience, and consequently cannot hold good of the soul after death.

[31] Cf. Critique, Die antinomie der reinen Vernunft.

[32] I therefore would be pleased to have the critical reader to devote to this antinomy of pure reason his chief attention, because nature itself seems to have established it with a view to stagger reason in its daring pretensions, and to force it to self-examination. For every proof, which I have given, as well of the thesis as of the antithesis, I undertake to be responsible, and thereby to show the certainty of the inevitable antinomy of reason. When the reader is brought by this curious phenomenon to fall back upon the proof of the presumption upon which it rests, he will feet himself obliged to investigate the ultimate foundation of all the cognition of pure reason with me more thoroughly.

[33] The idea of freedom occurs only in the relation of the intellectual, as cause, to the appearance, as effect. Hence we cannot attribute freedom to matter in regard to the incessant action by which it fills its space. though this action takes place from an internal principle. We dan likewise find no notion of freedom suitable to purely rational beings, for instance, to God, so far as his action is immanent. For his action, though independent of external determining causes, is determined in his eternal reason, that is, in the divine nature. It is only, if something, is to start by an action, and so the effect occurs in the sequence of time, or in the world of sense (e.g., the beginning of the world), that we can put the question, whether the causality of the cause must in its turn have been started, or whether the cause can originate an effect without its causality itself beginning. In the former case the concept of this causality is a concept of natural necessity, in the latter, that of freedom. From this the reader will see. that, as I explained freedom to be the faculty of starting an event spontaneously, I have exactly hit the notion which is the problem of metaphysics.

[34] Cf. Critique, the chapter on "Transcendental Ideals."

[35] Herr Platner in his Aphorisms acutely says (Sects. 728, 729), "If reason be a criterion, no concept, which is incomprehensible to human reason, can be possible. Incomprehensibility has place in what is actual only. Here incomprehensibility arises from the insufficiency of the acquired ideas." It sounds paradoxical, but is otherwise not strange to say, that in nature there is much incomprehensible (e.g., the faculty of generation) but if we mount still higher, and even go beyond nature, everything again becomes comprehensible; for we then quit entirely the objects, which can be given us, and occupy ourselves merely about ideas, in which occupation we can easily comprehend the law that reason prescribes by them to the understanding for its use in experience, because the law is the reason's own production.

[36] Der die Gegenstande anschaute.

[37] [The use of the word "world" without article, though odd, seems to be the correct reading, but it may be a mere misprint. -- Ed.]

[38] There is, e.g., an analogy between the juridical relation of human actions and the mechanical relation of motive powers. I never can do anything to an. other man without giving him a right to do the same to me on the same conditions; just as no mass can act with its motive power on another mass without thereby occasioning the other to react equally against it. Here right and motive power are quite dissimilar things, but in their relation there is complete similarity. By

means of such an analogy I can obtain a notion of the relation of things which absolutely are unknown to me. For instance, as the promotion of the welfare of children (= a) is to the love of parents (= b), so the welfare of the human species (= c) is to that unknown [quantity which is] in God (= x), which we call love; not as if it had the least similarity to any human inclination, but because we can suppose its relation to the world to be similar to that which things of the world bear one another. But the concept of relation in this case is a mere category, viz., the concept of cause, which has nothing to do with sensibility.

[39] I may say, that the causality of the Supreme Cause holds the same place with regard to the world that human reason does with regard to its works of art. Here the nature of the Supreme Cause itself remains unknown to me: I only compare its effects (the order of the world) which I know, and their conformity to reason, to the effects of human reason which I also know; and hence I term the former reason, without attributing to it on that account what I understand in man by this term, or attaching to it anything else known to me, as its property.

[40] Critique Pure Reason, II., chap. 3, section 7.

[41] Throughout in the Critique I never lost sight of the plan not to neglect anything, were it ever so recondite, that could render the inquiry into the nature of pure reason complete. Everybody may afterwards carry his researches as far as he pleases, when he has been merely shown what yet remains to be done. It is this a duty which must reasonably be expected of him who has made it his business to survey the whole field, in order to consign it to others for future cultivation and allotment. And to this branch both the scholia belong, which will hardly recommend themselves by their dryness to amateurs, and hence are added here for connoisseurs only.

[42] By no means "higher." High towers, and metaphysically-great man resembling them, round both of which there is commonly much wind, are not for me. My place is the fruitful bathos, the bottom-land, of experience; and the word transcendental, the meaning of which is so often explained by me but not once grasped by my reviewer (so carelessly has he regarded everything), does not signify something passing beyond all experience, but some. thing that indeed precedes it *a priori*, but that is intended simply to make cognition of experience possible. If these conceptions overstep experience, their employment is termed transcendent, a word which must be distinguished from transcendental, the latter being limited to the immanent use, that is, to experience. All misunderstandings of this kind have been sufficiently guarded against in the work itself, but my reviewer found his advantage in misunderstanding me.

[43] Idealism proper always has a mystical tendency, and can have no other, but mine is solely designed for the purpose of comprehending the possibility of our cognition *a priori* as to objects of experience, which is a problem never hitherto solved or even suggested. In this way all mystical idealism falls to the ground, for (as may be seen already in Plato) it inferred from our cognitions *a priori* (even from those of geometry) another intuition different from that of the senses (namely, an intellectual intuition), because it never occurred to any one that the senses themselves might intuit *a priori*.

[44] The reviewer often fights with his own shadow. When I oppose the truth of experience to dream, he never thinks that I am here speaking simply of the well-known somnio objective sumto of the Wolffian philosophy, which is merely formal, and with which the distinction between sleeping and waking is in no way concerned, and in a transcendental philosophy indeed can have

no place. For the rest, he calls my deduction of the categories and table of the principles of the understanding," common well- known axioms of logic and ontology, expressed in an idealistic manner." The reader need only consult these Prolegomena upon this point, to convince himself that a more miserable and historically incorrect, judgment, could hardly be made.

45 [Kant rewrote these sections in the second edition of the Critique.]

PREFATORY NOTE.

THIS work has been with me a labor of love. The gathering of materials for it, and the writing of it, as carrying me into what I feel to be interesting scenes, have afforded me great pleasure, which is the only reward I am likely to get. I publish it, as the last, and to me the only remaining, means of testifying my regard for my country -- loved all the more because I am now far from it -- and my country's philosophy, which has been the means of stimulating thought in so many of Scotland's sons.

The English-speaking public, British and American, has of late been listening to divers forms of philosophy, -- to Coleridge, to Kant, to Cousin, to Hegel, to Comte, to Berkeley, -- and is now inclined to a materialistic psychology. Not finding permanent satisfaction in any of these, it is surely possible that it may grant a hearing to the sober philosophy of Scotland.

M. Cousin has remarked that the philosophy of Scotland is part of the history of the country. I have treated it as such; and I claim to have one qualification for the work: I am in thorough sympathy with the characteristic sentiments of my native land. I have farther tried to make my work a contribution to what {iv} may be regarded as a new department of science, the history of thought, which is quite as important as the history of wars, of commerce, of literature, or of civilization.

Some of these articles have appeared in the "North British Review," the "British and Foreign Evangelical Review," and the "Dublin University Magazine; " but the greater number are now given to the public for the first time, and all of them have been rewritten.

I.-- CHARACTERISTICS OF THE SCHOOL

THE Germans have histories without number of their philosophy from Kant to Hegel, with not a few historical reviews of the later speculations. The French, too, have numerous sketches of the philosophy of their country generally, and of individual systems, such as that of Descartes. It is no way to the credit of British thought, and least of all to that of the Scotch metaphysicians, that we have not in our language a history of the Scottish school of philosophy. There are valuable notices of it, it is true, in Dugald Stewart's Historical Dissertation, and in his Eloges of Reid and Adam Smith; but Stewart is far too dignified and general in his style to be able to give an articulate account of the special doctrines of the different masters of the school, or a vivid picture of the times, with many of the marked characteristics of which he had no sympathy. The best history of the Scottish Philosophy is by a Frenchman, and has not been translated into English. We look on "Philosophic Ecossaise," the volume in which M. Cousin treats of the Scottish school, as containing upon the whole the most faultless of all his historical disquisitions. In his other volumes he scarcely does justice to Locke, whom he always judges from the evil consequences which have flowed from his philosophy on the continent, and he is not able to wrestle successfully with the powerful logical intellect of Kant; but he has a thorough appreciation of the excellencies of the Scottish metaphysicians, and, when he finds fault, his criticisms are always worthy of being considered. But it could not be expected of a foreigner, that he should thoroughly comprehend the state of Scotland when its peculiar philosophy arose, nor be able to estimate its relation to the national character; and the account given by M. Cousin is fragmentary, and critical rather than expository.

The Scottish Philosophy possesses a unity, not only in the circumstance that its expounders have been Scotchmen, but also and more specially in its method, its doctrines, and its spirit. It is distinguished by very marked and decided features, which we may represent as determined by the bones rather than the flesh or muscles.

1. It proceeds on the method of observation, professedly and really. In this respect it is different from nearly all the philosophies which went before, from many of those which were contemporary, and from some of those which still linger among us. The method pursued in Eastern countries, in ancient Greece and Rome, in the scholastic times, and in the earlier ages of modern European speculation, had not been that of induction, either avowedly or truly. No doubt, speculators have been obliged in all ages and countries to make some use of facts, in the investigation of both mind and matter. But in the earlier theosophies, physiologies, and philosophies, they looked at the phenomena of nature merely as furnishing a starting-point to their systems, or a corroboration of them; and their inquiries were conducted in the dogmatic, or deductive, or analytic manner,

explaining phenomena by assumed principles, or bringing facts to support theories, or resolving the complexities of the universe by refined mental distinctions. This spirit had been banished from physical science, first, by the great realistic awakening of the sixteenth century; then by the profound wisdom and far-sighted sagacity of Bacon; and, finally, by the discoveries of Newton and the establishment of the Royal Society of London. But it lingered for some ages longer in material science, from which it has not even yet been finally expelled. Bacon had declared, that his method was applicable to all other sciences as well as to the investigation of the material universe. "Does any one doubt (rather than object)," says he, "whether we speak merely of natural philosophy or of other sciences also, such as logics, ethics, politics, as about to be perfected by our method?" "We certainly," he replies, "understand all these things which have been referred to; and like as the vulgar logic, which regulates things by the syllogism, pertains not to the natural but all sciences, so ours, which proceeds by induction, embraces them all. For thus we would form a history and tables concerning anger, fear, modesty, and the like, as also examples of civil affairs, not omitting the mental emotions of memory, composition, division, judgment, and the rest, just as we form such of heat and cold, of light, vegetation, and such like." Sir Isaac Newton had said in his Optics: "And if natural philosophy in all its parts, by pursuing this method, shall at length be perfected, the bounds of moral philosophy will also be enlarged." But the employment of the method of induction in the study of the human mind was for ages slow, wavering, and uncertain. It has been asserted, that Descartes proceeded on the method of induction; but the statement has been made by metaphysicians who have never correctly apprehended the mode of procedure recommended by Bacon. Descartes does indeed appeal to profound ideas, which may be regarded as mental facts; but it is not by them to arrive at laws by a gradual generalization; it is rather to employ them as foundation-stones of his structure, which is reared high above them by the joint dogmatic and deductive method, and on the geometric and not the inductive plan. It has been averred that Hobbes proceeded on the method of his friend Bacon; but Hobbes nowhere professes to do so: his doctrine of the origin of civil government is a mere theory, and his system of the human mind and of morals is obtained by a very defective analysis, and in fact, is mainly borrowed from Aristotle, whose profounder principles he was incapable of appreciating. It cannot be denied that Locke does proceed very largely in the way of observation; but it is a curious circumstance that he nowhere professes to follow the method of induction; and his great work may be summarily represented as an attempt to establish by internal facts the preconceived theory, that all our ideas are derived from sensation and reflection. To the Scottish school belongs the merit of being the first, avowedly and knowingly, to follow the inductive method, and to employ it systematically in psychological investigation. As the masters of the school were the first to adopt it, so they, and those who have borrowed from them, are almost the only persons who have studiously adhered to it. The school of Condillac in France, and its followers in England {4} and Germany, do indeed profess to attend to observation, but it is after the manner of the empiricists, described by Bacon as beginning with experience, but immediately abandoning it for premature hypotheses. It will be seen, as we advance, that Kant followed the critical and not the inductive method. Hutcheson and Turnbull, and especially Reid and Stewart, have the credit of announcing unambiguously, that the human mind is to be studied exclusively by the method of observation, and of consistently employing this mode of procedure in all their investigations.

II. It employs self-consciousness as the instrument of observation. It may thus be distinguished from some other schools with which it has been confounded. Bacon, we have seen, did believe in the applicability of his method to all the mental sciences. But he had no clear apprehension of the

agency by which the observation is to be accomplished; he supposed it to be by " the history and tables concerning anger, fear, modesty, the memory, composition, division, judgment, and the like." In respect of the means of observation, philosophy is greatly indebted to Descartes, who taught men, in studying the human mind, to seize on great internal ideas. The questions started by Locke, and his mode of settling them, tend towards the same issue; he dwells fondly on reflection as the alone source of the ideas which we have of the workings of the human mind, and ever appeals to the internal sense as an arbiter in discussions as to the origin of ideas. But the Scottish philosophers took a step in advance of any of their predecessors, inasmuch as they professed to draw all the laws of mental philosophy -- indeed, their whole systems -- from the observations of consciousness.

By this feature they are at once distinguished from those who would construct a science of the human mind from the observation of the brain or nerves, or generally from animal physiology. Not indeed that the Scottish philosophy is required, by its manner or its principles, to reject the investigation of the functions of the bodily frame, as fitted to throw light on mental action. Certain of the masters of the school, such as Reid, Brown, and Hamilton, were well acquainted with physiology in its latest discoveries in their day, and carefully employed their knowledge to illustrate the operations of the human mind. {5} There is nothing in the method, or the spirit, or the cherished doctrines of the school tending to discountenance or disparage a painstaking experimental investigation of the parts of the bodily frame most intimately connected with mental action. Possibly the next great addition may be made to psychology, when internal observation of the thoughts and feelings, and external observation of the brain and nerves and vital forces, are in circumstances to combine their lights. But in the days of the great masters of the Scottish school, physiology was not in a state, nor is it yet in a position, to furnish much aid in explaining mental phenomena. The instrument employed by them was the internal sense; and they always maintained that it is only by it that we can reach an acquaintance with mind proper and its various operations, and that the knowledge acquired otherwise must ever be regarded as subordinate and subsidiary. They might have admitted that the occasion of the production, and the modifications of our mental states, could so far be influenced by the cerebro-spinal mass, or the forces operating in it; but they strenuously maintained that we can know what our perceptions, and judgments, and feelings, and wishes, and resolves, and moral appreciations are, not by the senses or the microscope, not by chemical analysis, or the estimation of the vital forces, but solely through our inward experience revealed by consciousness.

But let us properly understand what the Scottish school intend when they maintain that a science of the human mind can be constructed only by immediate consciousness. They do not mean that the study of the mind can be prosecuted in no other way than by looking in for ever on the stream of thought as it flows on without interruption. The operation of introspection is felt to be irksome in the extreme if continued for any length of time, and will certainly be abandoned when thought is rapid or feeling is intense; and those who trust to it exclusively are apt to fix their attention on a few favorite mental states, and omit many others no less characteristic of the human mind. He who would obtain an adequate and comprehensive view of our complex mental nature must not be satisfied with occasional glances at the workings of his own soul: he must take a survey of the thoughts and feelings of others so far as he can gather them from their deeds and from their words; from the {6} acts of mankind generally, and of individual men, women, and children; from universal language as the expression of human cogitation and sentiment; and from the commerce we hold with our fellow-men by conversation, by writing, or by books. Reid in particular is ever

appealing to men's actions and language, as a proof that there must be certain principles, beliefs, and affections in the mind. Still this evidence ever carries us back to consciousness, as after all both the primary witness and the final judge of appeal; as it is only by it, and by what has passed through our own minds, that we can come to discern and appreciate the feelings of our brother men.[2]

III. By the observations of consciousness, principles are reached which are prior to and independent of experience. This is another grand characteristic of the school, distinguishing it, on the one hand, from empiricism and sensationalism; and, on the other hand, from the dogmatism and *a priori* speculation of all ages and countries. It agrees with the former in holding that we can construct a science of mind only by observation, and out of the facts of experience; but then it separates from them, inasmuch as it resolutely maintains that we can discover principles which are not the product of observation and experience, and which are in the very constitution of the mind, and have there the sanction of the Author of our nature. These are somewhat differently apprehended and described by the masters of the school, some taking a deeper and others a more superficial view of them. Hutcheson calls them senses, and finds them in the very constitution of the mind. Reid designates them principles of common sense, and represents them as being natural, original, and necessary. Stewart characterizes them as fundamental laws of human thought and belief. Brown makes them intuitions simple and original. Hamilton views them under a great many aspects, but seems {7} to contemplate them most frequently and fondly after the manner of Kant, as *a priori* forms or conditions. But whatever minor or major differences there may be in the fulness of their exposition, or in the favorite views which they individually prefer, all who are truly of the Scottish school agree in maintaining that there are laws, principles, or powers in the mind anterior to any reflex observation of them, and acting independently of the philosophers' classification or explanation of them. While the Scottish school thus far agrees with the rational and *a priori* systems, it differs from them most essentially, in refusing to admit any philosophic maxims except such laws or principles as can be shown by self-inspection to be in the very constitution of the mind. It has always looked with doubt, if not suspicion, on all purely abstract and rational discussions, such as that by which Samuel Clarke demonstrated the existence of God; and its adherents have commonly discountenanced or opposed all ambitious *a priori* systems, such as those which were reared in imposing forms in Germany in the end of last, and the beginning of the present, century.

These three characters are found, in a more or less decided form, in the works of the great masters of the school. I am not sure indeed whether they have been formally announced by all, nor whether they have always been consistently followed out. I allow that the relation of the three principles one to another, and their perfect congruity and consistency, have not always been clearly discerned or accurately expressed. In particular, I am convinced that most of the Scottish metaphysicians have not clearly seen how it is that we must ever proceed in mental science by observation, while there are at the same time in the mind laws superior to and independent of observation; how it is that while there are *a priori* principles in the mind, it is yet true that we cannot construct a philosophy by *a priori* speculation. But with these explanations and deductions, it may be maintained that the characters specified are to be found, either announced or acted on, in the pages of all the writers of the school, from Hutcheson to Hamilton. Whenever they are discovered in the works of persons connected with Scotland, the writers are to be placed among the adherents of the school. Wherever there is the total absence of any one of them, we cannot allow the author a place in the fraternity. {8}

The Scottish metaphysicians and moralists have left their impression their own land, not only on the ministers of religion, and through them upon the body of the people, but also on the whole thinking mind of the country. The chairs of mental science in the Scottish colleges have had more influence than any others in germinating thought in the minds of Scottish youth, and in giving a permanent bias and direction to their intellectual growth. We have the express testimony of a succession of illustrious men for more than a century, to the effect that it was Hutcheson, or Smith, or Reid, or Beattie, or Stewart, or Jardine, or Mylne, or Brown, or Chalmers, or Wilson, or Hamilton, who first made them feel that they had a mind, and stimulated them to independent thought. We owe it to the lectures and writings of the professors of mental science, acting always along with the theological training and preaching of the country, that men of ability in Scotland have commonly been more distinguished by their tendency to inward reflection than inclination to sensuous observation. Nor is it to be omitted that the Scottish metaphysicians have written the English language, if not with absolute purity, yet with propriety and taste, -- some of them, indeed, with elegance and eloquence, -- and have thus helped to advance the literary cultivation of the country. All of them have not been men of learning in the technical sense of the term, but they have all been well informed in various branches of knowledge (it is to a Scottish metaphysician we owe the "Wealth of Nations"); several of them have had very accurate scholarship; and the last great man among them was not surpassed in erudition by any scholar of his age. Nor has the influence of the Scottish philosophy been confined to its native soil. The Irish province of Ulster has felt it quite as much as Scotland, in consequence of so many youths from the north of Ireland having been educated at Glasgow University. Though Scotch metaphysics are often spoken of with contempt in the southern part of Great Britain, yet they have had their share in fashioning the thought of England, and, in particular, did much good in preserving it, for two or three ages towards the end of last century and the beginning of this, from falling altogether into low materialistic and utilitarian views; and in this last age Mr. J. S. Mill got some of his views through his father from Hume, Stewart, and Brown, {9} and an active philosophic school at Oxford has built on the foundation laid b Hamilton. The United States of America especially the writers connected with the Presbyterian and Congregational Churches, have felt pleasure in acknowledging-, their obligations to the Scottish thinkers. It is a most interesting circumstance, that when the higher metaphysicians of France undertook, in the beginning of this century, the laborious work of throwing back the tide of materialism, scepticism, and atheism which had swept over the land, they called to their aid the sober and well-grounded philosophy of Scotland. Nor is it an unimportant fact in the history of philosophy, that the great German metaphysician, Emmanuel Kant, was roused, as he acknowledges, from his dogmatic slumbers by the scepticism of David Hume.

But the great merit of the Scottish philosophy lies in the large body of truth which it has -- if not discovered -- at least settled on a foundation which can never be moved. It has added very considerably to our knowledge of the human mind, bringing out to view the characteristics of mental as distinguished from material action; throwing light on perception through the senses; offering valuable observations on the intellectual powers, and on the association of ideas; furnishing, if not ultimate, yet very useful provisional classifications of the mental faculties; unfolding many of the peculiarities of man's moral and emotional nature, of his conscience, and of his taste for the beautiful; resolving many complex mental phenomena into their elements; throwing aside by its independent research a host of traditional errors which had been accumulating for ages; and, above all, establishing certain primary truths as a foundation on which to rear other truths, and as a breakwater to resist the assaults of scepticism.

In comparing it with other schools, we find that the transcendental speculators of Germany have started discussions which they cannot settle, and followed out their principles to extravagant consequences, which are a *reductio ad absurdum* of the whole method on which they proceed. Again, the physiologists have failed to furnish any explanation of consciousness, of thought, of moral approbation, or of any other peculiar mental quality. Meanwhile, the philosophy of consciousness has coordinated many facts, ascertained many mental laws, {10} explained many curious phenomena of our inward experience, and established a body of intuitive truths. By its method of careful observation, and by it alone, can the problems agitated in the rival *a priori* schools be solved, so far as they can be solved by the human faculties. Whatever aid physiological research as it advances may furnish to psychology, it must always be by the study, not of the brain, and nerves, and vital forces, but of our conscious operations, that a philosophy of the human mind is to be constructed. Whether the Scottish philosophy is to proceed exclusively in its old method, and go on co-ordinating facts with ever-increasing care, and expressing them with greater and greater precision, or whether it is to borrow from other schools, -- say to resolve in its own way the questions started by Schelling and Hegel, or to call in physiology to account for the rise of mental states, -- it is at least desirable that we should now have a combined view of what has been accomplished by the philosophy of consciousness. This is what is attempted in this work.

It should be freely admitted that the Scottish school has not discovered all truth, nor even all discoverable truth, in philosophy; that it does not pretend to have done so is one of its excellencies, proceeding from the propriety of its method and the modesty of its character. Among the writings of the Scottish school, it is only in those of Sir William Hamilton that we find some of the profoundest problems of philosophy, such as the conditions of human knowledge and the idea of the infinite discussed; and the majority of the genuine adherents of the school are inclined to think that on these subjects his conclusions are too bare and negative, and that he has not reached the full truth. Reid and Stewart are ever telling us that they have obtained only partial glimpses of truth, and that a complete science of the human mind is to be achieved solely by a succession of inquirers prosecuting the investigation through a series of ages. Brown and Hamilton make greater pretensions to success in erecting complete systems, but this is one of the defects of these great men, arising, as we shall see, from their departing from the genuine Scottish method, and adopting, so far, other and continental modes of philosophizing, the one betaking himself to the empirical analysis of the French sensational school, and the other adopting the critical method {11} of Kant; and it is to be said in behalf of Brown, that he never mounts into a re.-lion of cloudy speculation; and in favor of Hamilton, that his most vigorous efforts were employed in showing how little can be known by man. All the great masters of the school not only admit, but are at pains to show, that there are mysteries in the mind of man, and in every department of human speculation, which they cannot clear up. This feature has tempted some to speak of the whole school with contempt, as doing little because attempting little. They have been charged with their country's sin of caution, and the national reproach of poverty has been unsparingly cast upon them. Let them not deny, let them avow, that the charge is just. Let them acknowledge that they have proceeded in time past in the patient method of induction, and announce openly, and without shame, that they mean to do so in time to come. Let it be their claim, that if they have not discovered all truth, they have discovered and settled some truth -- while they have not promulgated much error, or wasted their strength in rearing showy fabrics, admired in one age and taken down the next. It is the true merit of Scotchmen that, without any natural advantages of soil or climate, they have carefully cultivated their land, and made it yield a liberal produce, and that they have been roused to activity, and

stimulated to industry, by their very poverty. Let it, in like manner, be the boast of the Scottish philosophy, that it has made profitable use of the materials at its disposal, and that it has by patience and shrewdness succeeded in establishing a body of fundamental truth, which can never be shaken, but which shall stand as a bulwark in philosophy, morals, and theology, as long as time endures.

The Scottish Philosophy

James McCosh
1875

II. STATE OF SCOTLAND.

DURING the seventeenth century, the three kingdoms had passed through a series of political and religious convulsions, and in the opening of the following century the Protestant people were seeking to enjoy and improve the seasonable -- as they reckoned it the providential -- rest which was brought by the Revolution Settlement. The floods had swept over the {12} country, partly to destroy and partly to fertilize, and men are busily employed in removing the evils (as they reckon them) which had been left, and in sowing, planting, and building on the now dry and undisturbed territory. In particular, there is a strong desire on the part of the great body of the people to make the best use of the peace which they now possess, and to employ it to draw forth the material resources of the country. As a consequence of the intellectual stimulus which had been called forth mainly by the previous great contests, and of the liberty achieved, and the industry in active exercise, the riches of the nation are increasing, agriculture begins to make progress, great commercial cities are aggregating, household and social elegance and comfort are sought after and in a great measure secured, refinement of manners is cultivated, and civilization is advancing. In the eager pursuit of these worldly ends, the Generation then springing up scarcely set sufficient value on the higher blessings which had been secured by the struggles of their forefathers. By the profound discussions of the seventeenth century, the great body of the people had been made to read their Bibles, and to inquire into the foundation and functions of political government. By the deeds done, by the sufferings endured, and the principles enunciated, the great questions of civil and religious liberty had been started, and opinions set afloat which were ultimately to settle them theoretically and practically. But the race now reared did not sufficiently appreciate the advantages thence accruing. They were kept from doing so by two impressions left by the terrible battles which had been fought on their soil.

Every one who has read the history of the period knows that a large amount of profligacy had prevailed among certain classes in the latter reigns of the Stuarts. The rampant vice led naturally to religious infidelity, and the two continued to act and react on each other. Self-indulgent men were little inclined to value the truths of spiritual religion, and lent their ears to plausible systems of belief or unbelief which left them undisturbed in their worldly enjoyments; while youths who had broken loose from the old religious trammels were often tempted to break through moral restraints likewise, and to rush into vice, as exhibiting spirit and courage. The great cavalier party, composed largely of the upper classes, and of {13} those who aspired to rise to them, had been all along in the habit of ridiculing the fervor and strictness of the puritan movement, which bad sprung up chiefly among the middle and better portion of the lower classes, and of describing all

who made solemn pretensions to religion as being either knaves or fools. Many of those who had originally brought the charge did not believe it in their hearts, as they had been constrained to respect the great and good qualities of their opponents; but they succeeded in instilling their sentiments into the minds of their children, who were taught to regard it as a mark of a gentleman to swear and to scoff at all religion. From whatever causes it may have proceeded, it is certain that in the first half of the eighteenth century there is a frequent and loud complaint on the part of theologians, both within and beyond the Established Churches, of the rapid increase and wide prevalence of infidelity, and even of secret or avowed atheism.

The struggles of the seventeenth century had left another very deep sentiment. The sects had contended so much about minor points, that now, in the reaction, there was a strong disposition, both among the professedly religious and irreligious, to set little or no value on doctrinal differences, and to turn away with distaste from all disputes among ecclesiastical bodies. The indifference thence ensuing tended, equally with the mistaken zeal of the previous age, to prevent the principles of toleration from being thoroughly carried out. Those who stood up for what were esteemed small peculiarities were reckoned pragmatical and obstinate. Their attempts to secure full liberty of worship and of propagation met with little sympathy, and were supposed to be fitted to bring back needlessly the battles and the sufferings of the previous ages. The two sentiments combined, the desire to have a liberal or a loose creed, and the aversion to the discussion of lesser differences, issued in a result which it is more to our present purpose to contemplate. It led the great thinkers of the age, such as Samuel Clarke, Berkeley, and Butler, to spend their strength, not so much in discussing doctrines disputed among Christians, as in defending religion in general, and in laying a deep foundation on which to rest the essential principles of morality and the eternal truths of religion, natural and revealed. The first age of the eighteenth century, as it was the period {14} in which the first serious attacks were made on Christianity, so it was also the time in which were produced the first great modern defences of religion, natural and supernatural. Men of inferior philosophical breadth, but of eminent literary power, such as Addison, were also employing their gifts and accomplishments and contributing to what they reckoned the same good end, by writing apologies in behalf of religion, and laboring to make it appear amiable, reasonable, and refined. These same causes led preachers of the new school to assume a sort of apologetic air in their discourses, to cultivate a refined language, moulded on the French, and not the old English model, to avoid all extravagance of statement and appeal, to decline doctrinal controversy, and to dwell much on truths, such as the immortality of the soul, common to Christianity and to natural religion, and to enlarge on the loveliness of the Bible morality. The manner and spirit were highly pleasing to many in the upper and refined classes were acceptable to those who disliked earnest religion, as they had nothing of "the offence of the cross;" and were commended by some who valued religion, as it seemed to present piety in so attractive a light to their young men, about whom they were so anxious in those times, and of whom they hoped that they would thus be led to imbibe its elements, and thereby acquire a taste for its higher truths. But all this was powerless on the great body of the people, who were perfectly prepared to believe the preacher when he told them that they were sinners, and that God bad provided a Saviour, but felt little interest in refined apologies in behalf of God and Christ and duty; and they gradually slipped away from a religion and a religious worship which had nothing to interest, because they had nothing to move them. All this was offensive in the extreme to those who had been taught to value a deeper doctrine and a warmer piety. They complained that when they needed food they were presented with flowers; and, discontented with the present state of things, they were praying for a better era.

To complete the picture of the times, it should be added that there was little vital piety among the clergy to counteract the tendency to religious indifference. The appointments to the livings in England and Ireland lay in the hands of the government and the upper classes, who preferred men of refinement {15} and prudence, inclined to political moderation or subserviency, to men of spiritual warmth and religious independence. The Nonconformists themselves felt the somnolent influence creeping over them, after the excitement of the battle in which they had been engaged was over. Their pastors were restrained in their ministrations, and consequently in their activities, by laws which were a plain violation of the principles of toleration, but which, as they did not issue in any overt act of bitter persecution, were not resented with keenness by the higher class of Dissenters, who, to tell the truth, after what they had come through in the previous age, were not much inclined to provoke anew the enmity from which they had suffered, but were rather disposed, provided only their individual convictions were not interfered with, to take advantage of what liberty they had, to proclaim peace with others, and to embrace the opportunities thrown open to them in the -- rowing cities and manufactories, of promoting the temporal interests of themselves and their families. In these circumstances, the younger ministers were often allured (as Butler was) to go over to the Established Church; and those who remained were infected with the spirit which prevailed around them, and sought to appear as elegant and as liberal as the clergy of the church, who were beginning to steal from them the more genteel portion of the younger members of their flocks. The design of those who favored this movement was no doubt to make religion attractive and respected. The result did not realize the expectation. The upper classes were certainly not scandalized by a religion which was so inoffensive, but they never thought of heartily embracing what they knew had no earnestness; and, paying only a distant and respectful obeisance to religion in the general, they gave themselves up to the fashion. able vices, or, at best, practised only the fashionable moralities of their times. The common people, little cared for by the clergy, and caring nothing for the refined emptiness presented to them instead of a living religion, went through their daily toils with diligence, but in most districts, both of town and country, viewed religion with indifference, and relieved their manual labor with low indulgences. England is rapidly growing in wealth and civilization, and even in industry, mainly from the intellectual stimulus imparted by moral causes acting in the {16} previous ages; but it is fast descending to the most unbelieving, condition to which it has ever been reduced. From this state of religious apathy it is roused, so far as the masses of the people are concerned, in the next age, and ere the life had altogether died out, by the trumpet voices of Whitfield and Wesley. It was in a later age, and after the earthquake convulsions of the French Revolution had shaken society to its foundation, that the upper classes were made to know and feel that when " the salt has lost its savor," it is good for nothing but to be cast out and trodden under foot of men, and that a dead religion is of no use either to rich or poor, either for political ends or for personal comfort.

An analogous, but by no means identical, process begins and goes on, and is consummated in Scotland about half an age or an age later in point of time. All throughout the seventeenth century, Scotland, like England, had been ploughed by religious contests. But the penetrating observer notices a difference between the shape taken by the struggle in the two countries. In England, the war had been a purely internal one between opposing principles, the prelatic and puritan; whereas, in Scotland, the battle had been mainly against an external foe, that is, an English power, which sought to impose a prelatic church on the people contrary to their wishes. Again, in England the contest had been against an ecclesiastical power, which sought to crush civil liberty; whereas, in Scotland, the power of the Church of Scotland had been exerted in behalf of the people, and

against a foreign domination. This difference in the struggle was followed by a difference in the state of feeling resulting when the contest was terminated by the accession of William and Mary.

The great body of the people, at least in the Lowlands, acquiesced in the Revolution Settlement, and clung round the Government and the Presbyterian Church as by law established. But there soon arose antagonisms, which, though they did not break out into open wars, as in the previous century, did yet range the country into sections and parties with widely differing sympathies and aims. In fact, Scotland was quite as much divided in opinion and sentiment in the eighteenth, as it ever was in the seventeenth century. In saying so, I do not refer to the strong prelatic feeling which existed all over the north {17} east coast of Scotland, or to the attachment to the house of Stuart which prevailed in the Highlands, -- for these, though they led to the uprisings of 1715 and 1745, were only the backward beatings of the retreating tide, -- but to other and stronger currents which have been flowing and coming into more or less violent collision with one another from that day till ours.

At the close of the seventeenth and beginning of the eighteenth century, the Church of Scotland was composed of a somewhat heterogeneous mixture of covenanting ministers, who had lived in the times of persecution; of prelatic clergy whose convictions in favor of Episcopacy were not sufficiently deep to induce them to abandon their livings, and to suffer the annoyances and persecutions to which the more sincere non jurors were exposed and of a race of young men zealous for the Presbyterian establishment, but "only half educated and superficially accomplished." The conforming "curates" were commonly indifferent to religion of every kind, and it was hoped that they would soon die out, and that the heritors and elders, with whom the election of pastors lay, would fill the churches with a learned and zealous ministry. But, in 1711, the Jacobite government of Queen Anne took the power of election from the parish authorities, and vested it in the ancient patrons, being the Crown for above five hundred and fifty livings, and noblemen, gentlemen of landed property, and town-councils, for the remaining four hundred.[3] The effect of this new law became visible in the course of years, in the appointment of persons to the churches who, for good reasons or bad, were acceptable to the government of the day, or were able to secure the favor of the private patrons. Forced upon the people in the first instance, there was a public feeling ready to gather round this law of patronage. From bad motives and from good -- like those which we have traced in England -- there was a desire among the upper, and a portion of the middle and educated, classes to have a clergy suited to the new age which had come in. As the result, there was formed a type of ministers which has continued till nearly our time in Scotland, called "New light" by the people, and designating themselves " moderates," as claiming the virtue of being moderate in all things, though, as Witherspoon charges {18} them, they became very immoderate for moderation, when they rose to be the dominant party. Most of them refrained in their preaching from uttering a very decided sound on disputed doctrinal points; some of them were suspected of Arianism or Socinianism, which, however, they kept to themselves out of respect for, or fear of, the Confession of Faith, which they had sworn to adhere to; the more highly educated of them cultivated a refinement and elegance of diction, and dwelt much on the truths common to both natural and revealed religion; and all of them were fond of depicting the high morality of the New Testament, and of recommending the example of Jesus. It is scarcely necessary to remark, that this style of preaching did not gain, as it did not warm, the hearts of the common people, who either became callous to all religion, without any zealous efforts being made to stir them up, or longed and prayed for a better state of things. The enforcement of the law of patronage, and the settlement of ministers against the wishes of the people, led to the separation of

the Erskines and the Secession Body in 1733, and of Gillespie and the Relief Body in 1753. In the Established Church there still remained a number of men of evangelical views and popular sympathies, such as Willison and Boston, who hoped that they might stem and ultimately turn the tide which was for the time against them. The boast of the moderate party was, that they were introducing into Scotland a greater liberality of sentiment on religious topics, and a greater refinement of taste. The charge against them is, that they abandoned the peculiar doctrines of the gospel, that they could not draw towards them the affections of the people who, in rural districts, sank into a stupid ignorance of religious truth, and, in the crowded lanes of the rising cities, into utter ungodliness and criminality, -- except, indeed, in so far as they were drawn out by the rapidly increasing dissenters, or by the evangelical minority within the Established Church. The collisions of the century took various forms. After the Union with England, dancing assemblies, theatres, and wandering players (with Allan Ramsay to patronize them), dancing on the tight-rope, cock-fighting, gambling, and horse-racing make their appearance, and receive considerable countenance and patronage from various classes, upper and lower; while {19} ineffectual attempts are made to put them down by civil penalties inflicted by burgher magistrates, and by public ecclesiastical censures, which the zealous clergy rigidly enforce, but which the new-light clergy are anxious to relax. In the turmoil of opinions which sprang up in this new state of things, there are rumors of deism, and even of atheism, being secretly entertained or openly avowed, and of the establishment here and there, in town and country, of " hell-fire clubs," where bold men met to discuss new opinions, and even, it is said, to act mock ceremonies, intended to ridicule the sacraments, and all that is awful in religion. Worse than all, and without being Much noticed, or meeting with much opposition on the part of the clergy of either party, there is the commencement of those drinking customs, which have ever since exercised so prejudicial an influence on the Scottish character.

If we look to the common people in the first quarter of the century, we find them in a state of great rudeness in respect of the comforts and elegancies of life. In the Highlands, they are scarcely removed above the lowest state of barbarism; and in the borders between the Highlands and Lowlands, the Celts are lifting cattle and exacting black-mail from the Lowlanders. Even in the more favored districts in the south of Scotland, the ground is unfenced; roads are very rare; and goods are carried on the backs of horses. The clothing of the people in the same region is of undyed black and white plaiding, and neither men nor women have shoes or stockings. Their ordinary food is oatmeal, pease, or beer, with kail groats and milk, and they rarely partake of flesh meat. The houses have only the bare ground as floors, with a fireplace in the midst, and the smoke escaping out of a hole in the roof, and with seats and the very beds of turf; even in the dwellings of the farmers there are seldom more than two apartments; not unfrequently, however, in the south-west of Scotland, there is in addition a closet, to which the head of the house would retire at set times for devotion. Superstitious beliefs are still entertained in all ranks of life, and are only beginning to disappear among the educated classes. In the Highlands and Islands, second-sight is as firmly believed by the chieftain as by the clansmen. In the Lowlands, mysterious diseases, arising from a deranged nervous {20} system, are ascribed to demoniacal possessions; and witches, supposed to have sold themselves to the Evil One, and accomplishing his purposes in inflicting direful evils on the persons and properties of neighbors, are being punished by the magistrates, who are always incited on by the people, and often by the more zealous ministers of religion. Toleration is not understood or acknowledged by any of the great parties, political or religious.

What, it may be asked, is there in the condition of this people fitted to raise any hope that they are

ever to occupy a high place among the nations of the earth? I am sure that a worldly-minded traveller, or an admirer of mere refinement and art, in visiting the country at those times, and comparing it with France or Italy, would have discovered nothing in it to lead him to think that it was to have a glorious future before it. But a deeper and more spiritually-minded observer might have discovered already the seeds of its coming intelligence and love of freedom: -- in the schools and colleges planted throughout the land in the love of education instilled into the minds of the people and, above all, in their acquaintance with the Bible, and in their determined adherence to what they believed to be the truth of God.[4]

Before the first age of the century has passed, there are unmistakable signs of industrial and intellectual activity. The Union has connected the upper classes with the metropolis and the Court of England, from which they are receiving a new refinement and some mental stimulus. The middle classes, and even the lower orders, are obtaining instruction from a very different quarter, from their parochial schools and churches, {21} from their burgh academies and their universities. The towns are hastening to take advantage of the new channels of trade and commerce; manufactures are springing up in various places, and already there is a considerable trading intercourse between the west of Scotland and America. The proprietors of the soil, in need of money to support their English life and to buy luxuries, are beginning to subdivide and enclose their lands, and to grant better dwellings and leases to their tenantry, who, being thereby placed in circumstances fitted to encourage and reward industry, are prepared to reclaim waste lands, to manure their grounds, to improve their stock of sheep and cattle, and introduce improved agricultural implements.

This imperfect sketch may help the reader to comprehend the circumstances in which the Scottish philosophy sprang up and grew to maturity, and the part which its expounders acted in the national history. It could have appeared only in a time of peace and temporal prosperity, but there had been a preparation for it in the prior struggles. The stream which had risen in a higher region, and long pursued its course in ruggedness, -- like the rivers of the country, -- is now flowing through more level ground, and raising up plenty on its banks. It is a collegiate, and therefore a somewhat isolated, element among the agencies which were forming the national character and directing the national destiny; but it had its sphere. Through the students at the universities, it fostered a taste for literature and art; it promoted a spirit of toleration, and softened the national asperities in religious and other discussions; it is identified with the liberalism of Scotland, and through Adam Smith, D. Stewart, Mackintosh, Horner, Brougham, Jeffrey, Sydney Smith, Lord John Russell, and Palmerston, with the liberalism of the three kingdoms; and, above all, it has trained the educated portion of the inhabitants of North Britain to habits of reflection and of independent thought. The Scottish metaphysicians, with the exception of Chalmers, have never identified themselves very deeply with the more earnest spiritual life of the country; but they defended the fundamental truths of natural religion, and they ever spoke respectfully of the Bible. The Scottish philosophy, so far as it is a co-ordination of the facts of consciousness, never can be antagonistic to a true theology; I believe indeed it may help to establish some {22} of the vital truths of religion, by means, for instance, of the moral faculty, the existence of which has been so resolutely maintained by the Scottish school. Some of the moderate clergy did at times preach the Scottish moral philosophy instead of scriptural truth; but they did so in opposition to the counsel of the metaphysicians, at least of Hutcheson, who recommended his students to avoid the discussion of philosophic topics in the pulpit. Some of those who have been the most influential expounders of the Scottish theology, such as Chalmers and Welsh, have also been supporters of the Scottish

philosophy, and have drawn from its established doctrines arguments in favor of evangelical religion.

The Scottish Philosophy

James McCosh
1875

III. -- PRECURSORS OF THE SCHOOL.

IN the Libraries of some of the Scotch Colleges are collected a number of the theses which had been defended in the Scottish Universities in the seventeenth century. These seem to fall under the heads of Theses Logicae, Theses Ethicae, Theses Physicae, Theses Sphericae. Aristotle still rules both in logic and ethics. In logic, there is much abstract enunciation, and there are many acute distinctions in regard to Ens and unity, singulars and universals; and in ethics, the discussions are about virtue and vice, and choice. In physics, there are rational and deductive investigations of the nature of motion and resistance. During the century, the courses of study differ somewhat in the different universities, but still there is a general correspondence. In the course of Philosophy the Regents use Aristotle *De Anima*, Porphyry's Introduction, the Categories of Aristotle, the Dialectics of Ramus, and the Rhetoric of Vossius, with the works of such writers as Crassotus, Reas, Burgersdicius, Ariaga, Oviedo, &c. The ethics include politics and economics, and there are discussions about the nature of habits. It is scarcely necessary to say that all topics are treated in a logical and rational, and not in an observational, manner and spirit.

The Parliamentary Commission for visiting the universities, appointed in 1690, and following years, directed, in 1695, the {23} professors of philosophy in St. Andrews to prepare the heads of a system of logic, and the corresponding professors in Edinburgh to prepare a course of metaphysics. The compends drawn up in consequence were passed from one college to another for revision there is no evidence that they were finally sanctioned, but they may be accepted as giving a fair idea of the instructions in philosophy conveyed in the universities of Scotland at the close of the eighteenth century, -- at the very time when Locke's Essay was finding its way so rapidly over the three kingdoms.[5] Logic is called the instrument to acquire other sciences, inasmuch as it prescribes rules for rightly apprehending, judging, and arguing. It is said to be defined by others as the science which directs the operations of the mind for finding out truth in every other science. It is represented as treating of the three operations of apprehension, judgment, and discourse, to which some add a fourth part, on method, under which analysis and synthesis are explained. In all this there is nothing but the commonplace of by-gone ages. But in this same text-book of logic we have the distinction drawn in the Port Royal Logic, between the extension and comprehension of the notion, adopted and stated. "We must distinguish betwixt the extension and comprehension of an idea. All the essential attributes of an idea are called its comprehension, as being, substance, vegetative, sensitive, and rational are the comprehension of man; but Peter, Paul, &c., contained under man, are called the extent of man." It can be shown that this distinction comes down in an unbroken historical chain in Glasgow to Sir W. Hamilton, who has so profitably amplified and

applied it. It is found in the Introduction to Logic by Carmichael, and in the Logical Compend of Hutcheson; and the latter continued to be used in Glasgow till towards the time when Hamilton was a student there. Metaphysics are said to be defined by some, as a science of being as being; by others as a speculative science, which considers being in general, and its properties and kinds, as abstracted from matter. The benefits arising from the study of metaphysics are said to be, that treating of undoubted truths and axioms, we are enabled by their assistance the better to discover truths generally, and avoid errors; that as dividing {24} beings into classes it keeps us from confusion; that giving general names to common and abstracted beings, it aids the understanding in every kind of learning, and specially in theology, in which use is made of metaphysical terms. The first part of metaphysics treats of the principles of being, and of the various species of beings. The second part treats of the properties of being, such as unity, verity, goodness; and under this head we have abstract discussions as to the finite and infinite, the necessary and contingent, the absolute and relative, cause and effect, means and end, substance and quality. Such was the pabulum on which college youths fed during the century. This was the learning which helped to sharpen the intellects of such men as Henderson, Rutherford, Leighton, Gillespie, Baillie, Dickson, Burnet (Bishop), Stair (Lord), and Carstairs, who acted so important a part in the affairs of their country.

But in order to appreciate fully the philosophic tastes and capacities of Scotchmen, we must follow them into France. From a very old date, certainly from the thirteenth century, there had been a close connection between that country and Scotland, arising from the jealousy entertained by both nations of the power and ambition of England. The Scottish youth who had a love of adventure, or a thirst for military glory, had a splendid opening provided for them in the Scottish Guard, which protected the person of the king of France, while those who had a taste for letters found means of instruction and employment in the numerous French colleges.[6] The Scotch scholars who returned to their own land brought back the French learning with them. Bishop Elphinston, who was the founder, and Hector Boece, who was the first principal of King's College, Aberdeen, had both taught in the University of Paris; and they set up the Scottish University on the model of the French one. John Major or Mair, who taught scholastic theology in Glasgow and St. Andrews, and who was the preceptor of Knox and Buchanan, had been for some time in the University of Paris. During the sixteenth, and the early part of the seventeenth century, there was a perpetual stream of Scottish scholars flowing into France. Some of these were Catholics, {25} to whom toleration was denied at home, and who betook themselves to a country where they had scope for the free exercise of their gifts. But quite as many were Protestants, who finding (as Scotchmen in later ages have done) their own land too narrow, or thirsting for farther knowledge or learned employment, connected themselves with one or other of the reformed colleges of Saumur, Montauban, Sedan, Montpellier, and Nismes, where some of them remained all their lives, while others returned to their own country. Some of these emigrants were lawyers or physicians; but by far the greater number of them were devoted to literature, philosophy, or theology. George Buchanan, Thomas Ricalton, three Blackwoods, Thomas Dempster, two Barclays, Andrew Melville, John Cameron, Walter Donaldson, and William Chalmers are only a few of the Scotchmen who occupied important offices in France. Two deserve to be specially named, as they wrote able logical works, -- the one, Robert Balfour, a Catholic, and Principal of Guienne College, Bourdeaux, and an erudite commentator on Aristotle; and the other, Mark Duncan, a Protestant, and Principal of the University of Saumur, and author of Institutes of Logic. There must have been some reality as the ground of the extravagant statement of Sir Thomas Urquhart in his "Discovery of a Most

Exquisite jewel," that "the most of the Scottish nation, never having restricted themselves so much to the propriety of words as to the knowledge of things, where there was one preceptor of languages among them, there was above forty professors of philosophy." "The French conceived the Scots to have above all nations in matter of their subtlety in philosophical disputations, that there have not been till of late for these several years together any lord, gentleman, or other in all that country, who, being desirous to have his son instructed in the principles of philosophy, would entrust him to the discipline of any other than a Scottish master." He adds, that "if a Frenchman entered into competition, a Scotchman would be preferred."

By such teaching at home, and by such foreign intercourse, a considerable amount of narrow but intense intellectual life was produced and fostered in Scotland. But youths were beginning to feel that the air was too close, too confined, and too monastic for them, and were longing for greater freedom and {26} expansion. While Aristotle and the scholastic method still hold their place in the cloisters of the colleges, there is a more bracing atmosphere in the regions without and beyond; and this is now to rush into Scotland. From the time of the revival of letters in the sixteenth century, almost every great and original thinker had thought it necessary to protest against the authority of Aristotle and the schoolmen. Bacon left Cambridge with a thorough contempt for the scholastic studies pursued there; and the grand end aimed at in his "Novum Organum," was to carry away men's regards from words and notions, to which they had paid too exclusive attention, and to fix them on things. In respect of a disposition to rebel against Aristotle and the schoolmen, Descartes was of the same spirit as Bacon; and Gassendi and Hobbes agreed with Descartes, with whom they differed in almost every thing else. It would be easy to produce a succession of strong testimonies against the Stagyrite and the Mediaevals, spread over the whole of the seventeenth century. The rising sentiment is graphically expressed by Glanvil in his "Scepsis Scientifica," published in 1665. He declares that the " ingenious world is grown quite weary of qualities and forms-," he declaims against "dry spinosities, lean notions, endless altercations about things of nothing; " and he recommends a " knowledge of nature, without which our hypotheses are but dreams and romances, and our science mere conjecture and opinion; for, while we have schemes of things without consulting the phenomena, we do but build in the air, and describe an imaginary world of our own making, that is but little akin to the real one that God made."

The realistic reaction took two different but not totally divergent directions in the seventeenth century, and both the streams reached Scotland in the following century. In the works of Grotius and Puffendorf, an elaborate attempt was made to determine the laws of nature in regard to man's political and social conditions, and apply the same to the examination and rectification of national and international laws. This was thought by many to be a more profitable and promising theme than the perpetual discussion of the nature of being and universals. This school had undoubtedly its influence in Scotland, where Carmichael, in 1718, edited and annotated Puffendorf, {27} and where Hutcheson, and Hume, and A. Smith, and Ferguson, and D. Stewart, combined juridical and political with moral inquiries, and became the most influential writers of the century on all questions of what has since been called social science.

But a stronger and deeper current was setting in about the same time,-a determination to have the experimental mode of investigation applied to every department of knowledge. This method had already been applied to physical science with brilliant results. And now there was a strong desire felt to have the new manner adopted in the investigation of the human mind. In 1670, John Locke and five or six friends are conversing in his chamber in Oxford on a knotty topic, and quickly they find themselves at a stand; and it occurred to Locke that, before entering " on inquiries of that

nature, it was necessary to examine our own abilities, and see what objects our understandings were or were not fitted to deal with." He pondered and wrote on this subject for twenty years, at the close of which (in 1690) he published his immortal " Essay on the Human Understanding." In this work he would banish for ever those innate ideas which had offered such obstacles to the progress of thought; and, by an inquiry into the actual operations of the human mind, he would trace the ways in which mankind attain ideas and knowledge, and settle the bounds imposed on the human understanding. Locke's Essay was hailed with acclamation by all who were wearied of the old scholastic abstractions and distinctions, and who had caught the new spirit that was abroad.

Still Locke's Essay was not allowed to take possession of the thinking minds of the country without a vigorous opposition. Locke was met in his own day by Stillingfleet, the Bishop of Worcester, who argued resolutely that the view given in the Essay of our idea of substance was not sufficiently deep to enable it to bear up the great truths of religion, especially the doctrine of the Trinity. The great Leibnitz severely blamed Locke for overlooking necessary truth, and reviewed his work, 'book by book and chapter by chapter, in his "Nouveaux Essais sur l'Entendement Humain; " which, however, in consequence of Locke's death taking place in the mean time, was not published for many years after. It was felt by many otherwise {28} favorable to the new spirit, that Locke had not laid a sufficiently deep foundation for morality in his account of our idea of virtue, which he derived from mere sensations of pleasure and pain, with the law of God superadded in utter inconsistency with his theory. There were still in England adherents of the great English moralists, More and Cudworth, who had opposed Hobbes with learning and ability; and these maintained that there was need of deeper principles than those laid down by Locke to oppose the all-devouring pantheistic fatalism of Spinoza on the one hand, and the rising materialistic spirit on the other.

In the early part of the eighteenth century, there appeared several works which were not conceived at least wholly in the spirit of Locke. I do not refer to such works as Norris's "Ideal World," in which we have an able defence of the Aristotelian analysis of reasoning, and an exposition of Platonism, more ideal far than that presented in Plato's own dialectic; nor to Collier's "Clavis," "being a demonstration of the non-existence or impossibility of an external world:" I allude to works which left a far deeper impression on their age. Samuel Clarke, with vast erudition and great logical power, was establishing, in a mathematical manner, the existence and attributes of God, giving virtue a place among the eternal relations of things perceived by reason, and defending the doctrine of human freedom and responsibility against those who were reducing men to the condition of brutes or machines. Berkeley did adopt the theory of Locke as to the mind being percipient only of ideas, but the view which he took of human knowledge was very different; for while Locke, consistently or inconsistently, was a sober realist, Berkeley labored to show that there was no substantial reality except spirit, and thought in this way to arrest the swelling tide of materialism and scepticism. A more accurate thinker than either, Bishop Butler, was establishing the supremacy of conscience, and showing that there was a moral government in the world; and that revealed religion was suited to the constitution of the mind, and to the position in which man is placed.

It was while philosophic thought was in this state that the Scottish Philosophy sprang up. The Scottish metaphysicians largely imbibed the spirit of Locke; all of them speak of him {29} with profound respect; and they never differ from him without expressing a regret or offering an apology. Still the Scottish school never adopted the full theory of Locke; on the contrary, they opposed it in some of its most essential points; and this while they never gave in to the mathematical method of Clarke, and while they opposed the ingenuities of Berkeley. Hutcheson,

the founder of the Scottish school, was a rather earlier author than Butler, to whom therefore he was not indebted for the peculiarities of his method and system. But there was a writer to whom both Butler and Hutcheson, and the early Scottish school generally, were under deeper obligation than to any other author, or all other authors, and who deserves in consequence a more special notice.

1875

IV. -- SHAFTESBURY.

THE author who exercised the most influence on the earlier philosophic school of Scotland was not Locke, but Lord Shaftesbury (born 1671, died 1713), the grandson of the Lord Chancellor Shaftesbury, who bad been the friend of Locke. " Peace," says he, " be with the soul of that charitable and courteous author, who, for the common benefit of his fellow-authors, introduced the way of miscellaneous writing." He follows this miscellaneous method. The pieces which were afterwards combined in his " Characteristics of Men, Manners, and Times," were written at various times, from I 707 to 1712. They consist of a " Letter Concerning Enthusiasm," " Sensus Communis, an Essay on the Freedom of Wit and Humor," " Soliloquy, or, Advice to an Author," "An Inquiry Concerning Virtue and Merit," "The Moralists, a Philosophical Rhapsody," "Miscellaneous Reflections on the said Treatises, and other Critical Subjects," "A Notion of the Historical Draught or Tablature of the judgment of Hercules, with a Letter concerning Design." He tells us that the miscellaneous manner was in the highest esteem in his day, that the old plan of subdividing into firsts and seconds had grown out of fashion, and that the " elegant court divine exhorts in miscellany, and is ashamed to bring his {30} twos and threes before a fashionable assembly." " Ragouts and fricassees are the reigning dishes; so authors, in order to become fashionable, have run into the more savory way of learned ragout and medley." His style is evidently after the French, and not the old English, model. It has the jaunty air of one who affects to be a man of elegance and fashion. Undoubtedly he was extensively read in the Greek and Roman philosophy, especially in Plato, Aristotle, Cicero, and the Roman Stoics, and he has many just and profound views, but these are ever made to appear as the ornaments of a modern nobleman, who studies philosophy as an accomplishment.

His " Characteristics" open with remarks on " Enthusiasm," and on " Wit and Humor." He tells us that "vapors naturally rise," and he would dispel them by ridicule. " The melancholy way of treating religion is that which, according to my apprehension, renders it so tragical, and is the occasion of its acting in reality such dismal tragedies in the world." He would " recommend wisdom and virtue in the way of pleasantry and mirth," and tells us that " good-humor is not only the best security against enthusiasm, but the best foundation of piety and true religion." It does not appear very clearly what is the nature of the piety and religion which he would recommend. Sometimes he seems to scoff at the Scriptures, and at all their spiritual verities and holy mysteries; at other times he would make it appear as if he wished to be thought a believer in Christianity. There is, I suspect, much of latent levity in the profession he makes: " We may in a proper sense be said faithfully and dutifully to embrace those holy mysteries even in their minutest particulars, and

without the least exception on account of their amazing depth," " being," he adds, " fully assured of our own steady orthodoxy, resignation, and entire submission to the truly Christian and catholic doctrines of our holy church, as by law established."

But he reckons these pleasantries merely as an introduction to graver subjects. He has largely caught the spirit of Locke, but he by no means follows him, especially in his rejection of innate ideas. "No one," says he, "has done more than Locke towards recalling of true philosophy from barbarity into the use and practice of the world, and into the company of the better and politer sort, who might well be ashamed of it in its {31} other dress. No one has opened a better and clearer way to reason." But he qualifies his praise. "'Twas Mr. Locke that struck at all fundamentals, threw all order and virtue Out Of the world, and made the ideas of these, which are the same with those of God, unnatural, and without foundation in our minds. *Innate* is a word he poorly plays upon: the right word, though less used, is *connatural*." He shows that there are many of our mental qualities natural to us. " Life, and the sensations which accompany life, come when they will, are from mere nature and nothing else. Therefore, if you dislike the word innate, let us change it, if you will, for instinct, and call instinct that which nature teaches, exclusive of art, culture, or discipline." Beginning with these lower affections, he goes on to show that preconceptions of a higher kind have place in human kind, preconceptions' of the 'fair and beautiful.'"[7]

He reviews the famous argument of Descartes, " We think, therefore we are." "Nothing more certain: for the Ego or I being established in the first part of the proposition, the Ergo, no doubt, must hold it good in the latter." "For my own part," he adds, "I take my being upon trust" He everywhere appeals to the "Sensus Communis," or Common Sense. His general doctrine is thus expressed: "Some moral and philosophical truths there are withal so evident in themselves, that it would be easier to imagine half mankind to have run mad, and joined precisely in one and the same species of folly, than to admit any thing as truth which should be advanced against such *natural knowledge, fundamental reason, and common sense*."[8] He allows that what is natural to us may require labor and pains to bring it out. " Whatever materials or principles of this kind we may possibly bring with us, whatever good faculties, senses, or anticipating sensations and imaginations may be of nature's growth, and arise properly of themselves without our art, promotion, or assistance, the general *idea* which is formed of all this management, and the clear notion we attain of what is preferable and principal in all these subjects of choice and estimation, will not, as I imagine, by any person be taken for {32} *innate*. Use, practice, and culture must precede the under standing and wit of such an advanced size and growth as this." These surely are the very views which were developed more fully and articulately by Reid, in his opposition to the scepticism of Hume. The object of his works is to carry out these principles to taste and morals. "Nor do I ask more when I undertake to prove the reality of virtue and morals. If I be certain that I am, it is certain and demonstrable who and what I should be." Should one who had the countenance of a gentleman ask me why I would avoid being nasty when nobody was present?' in the first place, I should be fully satisfied that he himself was a very nasty gentleman who could ask this question, and that it would be a hard matter for me to make him ever conceive what true cleanliness was. However, I might, notwithstanding this, be contented to give him a slight answer, and say, I It was because I had a nose.' Should he trouble me further, and ask again, 'What if I had a cold? or what if naturally I had no such nice smell?' I might answer perhaps, 'That I cared as little to see myself nasty as that others should see me in that condition.' I But what if it were in the dark?' 'Why, even then, though I had neither nose nor eyes, my *sense* of the matter would still be

the same: my nature would rise at the thought of what was sordid."' He thus reaches a sense of beauty. "Much in the same manner have I heard it asked, 'Why should a man be honest in the dark?"' The answer to this question brings him to a moral sense.

He speaks of nature in general, and human nature in particular, as an " economy," and as having a "constitution" and a "frame." In examining the nature of the soul, he finds (1) self-affections, which lead only to " the good of the private." He enumerates, as belonging to this class, ,love of life, resentment of injury, pleasure, or appetite towards nourishment and the means of generation; interest, or the desire of those conveniences by which we are well provided for or maintained; emulation, or love of praise and honor; indolence, or love of ease and rest." But he finds also (2) natural affections, which lead to the good of the public. He takes great pains to establish the existence of disinterested affections, and opposes the views of those who, like Rochefoucauld, would resolve all human action {33} into a refined selfishness. Referring to the common saying, that interest governs the world, he remarks shrewdly: " Whoever looks narrowly into the affairs of it, will find that passion, humor, caprice, zeal, faction, and a thousand other springs which are counter to self-interest, have as considerable a part in the movements of this machine. There are more wheels and counterpoises in this engine than are easily imagined." With such affections, " man is naturally social, and society is natural to him;" and in illustrating this position, he sets himself vigorously against the social theory of Hobbes, who represents the original state of man as one of war. Virtue consists in the proper exercise of these two classes of affections. Vice arises when the public affections are weak and deficient, when the private affections are too strong, or affections spring up which do not tend to the support of the public or private system. He shows that virtue, as consisting in these affections, is natural to man, and that he who practises it is obeying the ancient Stoic maxim, and living according to nature. The virtues which he recommends fall far beneath the stern standard of the Stoics, and leave out all the peculiar graces of Christianity: they consist of, -- "a mind subordinate to reason, a temper humanized and fitted to all natural affection, an exercise of friendship uninterrupted, thorough candor, benignity, and good-nature, with constant security, tranquillity, equanimity."

He would establish a morality on grounds independent of religion. "Whoever thinks that there is a God, and pretends formally to believe that he is just and good, must suppose that there is, independently, such a thing as justice, truth, and falsehood, right and wrong, according to which he pronounces that God is just, righteous, and true." " If virtue be not really estimable in itself, I can see nothing estimable in following it for the sake of a bargain; " and he complains of those who " speak so much of the rewards and punishments, and so little of the worth or value of the thing itself." He remarks very justly: " By building a future state on the ruins of virtue, religion in general, and the cause of a deity, is betrayed; and by making rewards and punishments the principal motives to duty, the Christian religion in particular is overthrown, and its greatest principle, that of love, rejected and exposed." He admits, how {34} ever, that a good God, as a model, has an effect on our views of morals and conduct; and allows that "fear of future punishment and hope of future reward, how mercenary and servile however it may be accounted, is yet, in many circumstances, a great advantage, security, and support to virtue."

Such is his view of the nature of virtue. But Shaftesbury is quite aware that the question of the character of the virtuous act is not the same as that of the mental faculty which looks at it and appreciates it. This faculty he represents as being of the nature of a sense. Locke had allowed the existence of two senses, an external and an internal; and had labored in vain to derive all men's ideas from these two sources. Hutcheson, perceiving that the inlets to the mind were too few

according to the theory of Locke, calls in other senses. These senses become very numerous in the systems of some of the Scottish metaphysicians, such as Gerard. In the writings of Shaftesbury, two occupy an important place, -- the sense of beauty and the moral sense.

"No sooner," he says, "does the eye open upon figures, the ear to sounds, than straight the Beautiful results, and grace and harmony are known and acknowledged. No sooner are actions viewed, no sooner the human affections and passions discerned (and they are most of them as soon discerned as felt), than straight an *inward* eye distinguishes and sees the *fair* and *shapely*, the *amiable* and *admirable*, apart from the *deformed*, the *foul*, the *odious*, or the *despicable*." Though in all this advancing quite beyond the "Essay on the Human Understanding," yet he seems to be anxious to connect his view of the moral sense with the reflection or inward sense of Locke. "In a creature capable of forming general notions of things, not only the outward beings which offer themselves to the sense are the objects of the affections, but the very actions themselves, and the affections of pity, kindness, gratitude, and their contraries, being brought into the mind by reflection, become objects. So that by means of this reflected sense, there arises another kind of affection towards these very affections themselves, which have been already felt, and are now become the subject of a new liking or dislike." Conscience is represented by him "as the reflection in the mind of any unjust action or behavior, which he knows to be naturally odious and ill-deserving. {35} No creature can maliciously and intentionally do ill, without being sensible, at the same time, that he deserves ill. And in this respect, every sensible creature may be said to have a conscience."[9]

He has evidently been smitten with some of the Platonic views of beauty. "We have," he says, "a sense of order and proportion; and having, a sensation, reason can give this account of it, that whatever things have order, the same have unity of design and concur in one, are parts constituent of one whole, or are in themselves one system. Such is a tree with all its branches, an animal with all its members, an edifice with all exterior and interior ornaments." He is fond of connecting or identifying the beautiful and the good; in fact, virtue is represented by him as a higher kind of beauty. "It is, I must own, on certain relations or respective proportions, that all natural affection does in some measure depend." "The same numbers, harmony, and proportions have a place in morals." He evidently clings fondly to the idea that " beauty and good are one and the same."

We have given so full an account of the philosophy of Shaftesbury, because of the influence which it exercised on the Scottish Philosophy. Francis Hutcheson did little more than expound these views, with less versatility, but in a more equable, thorough, and systematic manner. Turnbull, who founded the Aberdeen branch of the school, and influenced greatly the mind of Reid, avowedly drew largely from Hutcheson in his theories of taste and virtue. Reid and Beattie got their favorite phrase, " common sense," I have no doubt, directly or indirectly from the treatise so entitled in the " Characteristics." Hume was evidently well acquainted with the writings of {36} Shaftesbury; and I am inclined to think that they may have helped to form his style, and to suggest some of his essays. We have an anticipation of the spirit of Hume in the miscellany entitled, " Philocles to Palemon:" "You know that in this Academic Philosophy I am to present you with, there is a certain way of questioning and doubting, which in no way suits the genius of our age. Men love to take party instantly. They can't bear being kept in suspense. The examination torments them." Theocles observes, that "if there be so much disorder in the present state of things, he would not be disposed to think better of the future." Lord Monboddo declares that " Shaftesbury's Inquiry is the best book in English on the subject of morals." His Draught or Tablature of the judgment of Hercules, and his Disquisitions on Taste, originated the theories of

Beauty which formed an essential part of Scottish metaphysics for more than a century.

The Scottish Philosophy

James McCosh
1875

V. -- GERSHOM CARMICHAEL.

SIR WILLIAM HAMILTON says that Gershom Carmichael "may be regarded, on good grounds, as the real founder of the Scottish school of philosophy." ("Reid's Works," P. 30.) I am disposed to retain the honor for Francis Hutcheson, to whom it is usually ascribed. Carmichael does not possess the full characteristics of the school. He seems to me to be the bond which connects the old philosophy with the new in Scotland.

He was descended from a genuine covenanting stock. His father was Alexander Carmichael, the son of Frederick Carmichael, who had been minister in various places in Fifeshire, and who died in 1667; his mother was relict (she had been the second wife) of Fraser of Bray. Alexander was minister at Pittenain, and had at one time been attached to prelacy, but abandoned it to join the suffering ministers. Early in 1672, he is in the tolbooth of Edinburgh. On February 22, he is before the Council, charged with keeping conventicles, and is ordered to depart the kingdom, never to return without license; and February 26, he is transported in a ship to London, where {37} he was useful as a minister, and died about the year 1676 or 1677. In 1677, shortly after his death, there was published, from the copy which he had left, a treatise, entitled, "The Believer's Mortification of Sin by the Spirit," edited by Thomas Lye, who says in the preface, "As for that flesh of his flesh, and the fruit of his loins, as for that Ruth and Gershom he hath left behind him, I question not but as long as the saints among you continue to bear your old name, Philadelphia (so the old Puritans of England have used to style you), you will not, you cannot, forget to show kindness to Mephibosheth for Jonathan's sake." Gershom, so called by his father because he was "a stranger in a strange land," seems to have been born in London about 1672. It may be supposed that the family returned to Scotland after the father's death. We certainly find Gershom enrolled a Master of Arts in the University of Edinburgh, July 31, 1691. He afterwards became Regent at St. Andrews, where he took the oath of allegiance, and subscribed the Assurance. On November 22, 1694, he is elected and admitted Master in the University of Glasgow, having been brought in by public dispute, that is, by disputation on comparative trial, through the influence of Lord Carmichael, afterwards the first Earl of Hyndford. About the same time he lost his mother, and "married a good woman, the daughter of Mr. John Inglis." Wodrow, who tells us this (" Letters "), was his pupil, and describes him as at that time possessed of little reading, as dictating several sheets of peripatetic physics *de materia prima*, as teaching Rohault, and being very much a Cartesian, -- this seven years after the publication of Newton's " Principia." Afterwards he made himself master of the mathematics and the new philosophy, and Wodrow used to jest with him on this matter of his juvenile teaching. From these notices it appears that, by parentage and birth and

training and ancestral prepossessions, he belongs to the seventeenth, but catches the spirit of the eighteenth century. He exhibits in his own personal history the transition from the old to the new thought of Scotland.

He is represented as a hard student, a thinking, poring man, his favorite study being moral philosophy. At the commencement of his professorial life, a Master took up the batch of students as they entered on the study of philosophy, and carried {38} them in successive years through all the branches, including logic, pneumatology, moral philosophy, and natural philosophy. This system required the teacher to be a well-informed man in various departments, but was a hindrance to eminence in any one branch of learning. But from 1727 the Masters are restricted to their several classes, and to Carmichael is consigned moral philosophy. It appears that, in 1726, there were thirty-six students in the third year's class, and nineteen in that of the fourth year; in the latter days of Carmichael the numbers were larger. The classes were swelled by non-conforming students from England, who, shut out from the English universities by their tests and their churchified influence, betook themselves to the Scottish colleges. Many of these were attracted to Glasgow by the fame of Carmichael. The college session lasted from the beginning of November to the end of May. On the Lord's day, the Masters met with their classes, to take an account of the sermons, and this was a work in which Carmichael felt a special interest.

Carmichael was a most affectionate, friendly man, but withal a little warm in his temper, and became involved in consequence in scenes which seem somewhat inconsistent with the supposed calm of an academic life. The college corporation was evidently much agitated by internal feuds, and Carmichael takes his part in them, commonly siding with the party of independence against the Principal. In 1704, joined by Mr. Loudon, he protests that several things minuted as Acts of Faculty were written and signed privately by the Principal. The Faculty finds the charge unfounded, and suspends the two from their functions. Subsequently they ask forgiveness, and are restored. In 1705, Mr. Law, one of the Regents, complains that some expressions had been uttered against him by Mr. Carmichael, who is gravely admonished, and exhorted to avoid every thing irritating towards his colleagues in time to come. In 1717, there are hot disputes as to who should elect the Rector. The Masters combine against the Principal, call the students to the common hall, and choose their man. But, in 1718, the Commission for the Visitation of the College finds some of the Masters, including Carmichael, guilty of great disorder in the election of the Rector; and they are discharged for a time from exercising any part of their office (such as choosing professors), {39} except the ordinary discipline in the class. In 1722, a bonfire was kindled by the students on a decision in favor of the election of Lord Molesworth (we shall meet with him again in these articles) to Parliament, and Carmichael rushes into the heart of the mob, and gets into trouble in extinguishing the flames. In November, 1728, we find him joining in a protest against the claim of the Chancellor to sit and vote. It was by such disputes that the constitution of the Scottish colleges came to be settled.

Patriotic exertions helped to relieve the sameness of the college life, and in these the collegiate body in Glasgow (it was different in Aberdeen) are of one mind. In 1708, the kingdom is threatened with "an invasion of French and Irish papists," and the Masters agree each to maintain a number of foot soldiers; and Carmichael signs for five men. In September, 1715, the rising in the north of Scotland in favor of the pretender becomes known. The Faculty agrees to raise fifty men at sixpence a day; the Principal provides eight, the professor of divinity five, and Carmichael subscribes for four. It was by such active exertions in the south of Scotland that the progress of the Rebellion was so speedily arrested.

In his later years, as he became known, Carmichael carried on a correspondence with Barbeyrac and other learned men. He had a numerous family, "who were all a comfort to him, except one, who was a cause of great distress." Wodrow says, that " in his advanced years he was singularly religious. I know he was under great depths of soul exercise, and much the worse that he did not communicate his distress to anybody almost." This is the only record we have of a Scottish metaphysician having had his" soul exercises;" but surely there must have been others who had their conflicts as they dived into the depths of the human soul. For the last two or three years of his life, he had a cancerous wart, which spread over one eye and across his nose to the other eye, and at last carried him off. During all his illness he remained a hard student and serious Christian. He died, November 25, 1729. On his death the English students leave the university, the attendance at which is reported by Wodrow as very thin in December; and it does not seem to improve till Hutcheson commences his lectures in the following October. {40}

Carmichael published "Breviuscula Introductio ad Logicam," which reached a second edition in 1722. He defines logic as the science which shows the method of discovering truth, and of expounding it to others. He represents it as having to do with judgment, but then it also treats of apprehension as necessary to judgment. Under apprehension he speaks of the doctrine of the difference of the comprehension and extension of a notion, and of the former being evolved by definition, and the latter by division, as being quite commonplace. He distinguishes between immediate and mediate judgment. Immediate is between two ideas immediately compared; mediate, in which the comparison is by means of a third judgment, is called discourse. He says all knowledge may ultimately be resolved into immediate judgments, known in their own light; and he divides immediate judgments into two classes: one abstract, in which there is no direction of the mind to the thing itself as really existing, *e.g.*, the whole is greater than a part; and the other intuitive, when the mind has a consciousness of the thing as present, as, for example, the proposition, *Ego cogitaits existo*. Coming to mediate judgment, he gives as the supreme rule of affirmative syllogism the axiom, "Things which are the same with one and the same third are the same with one another g, " and of negative syllogisms the axiom, " Things of which one is the same with a third, and the other not the same, are not the same with one another." These statements show a " thinking, poring," man, and will be valued most by those who have thought longest on these subjects. We see a new historical step in the transmission of the distinction between the extension and comprehension of a notion; we see that the difference between immediate and mediate judgments was known in these times; and that there was an attempt to find a supreme rule of mediate reasoning in the sameness (here lies the looseness) of two things with a third. Carmichael is aware that there are propositions seen to be true in their own light; and that there is an intuitive apprehension, in which the thing is known as present; and many will think that the *ego cogitaiis existo* is a preferable form to the *cogito ergo sum* of Descartes.

Carmichael published an edition of Puffendorf, " De Officio Hominis et Civis," with Notes and Supplements, for the use of students, described by Hutcheson as more valuable than the {41} original work. In the notes he offers many acute observations, and gives extracts from De Vries, Titius, and Grotius. In the first supplement he speaks of a divine law, to which all morality has reference, which alone obliges, and to which all obligation of human laws is ultimately to be referred. The law may be made known either by means of signs, oral or written, or by the constitution of human nature, and other things which offer themselves to the observation of men. What is known by the latter is called *natural law*, which has two meanings, -- one the faculty of reason itself as given to man by God, and the other such a power of intelligence as can discover

what is in nature by ordinary diligence. He takes far higher grounds of religion than those adopted by Shaftesbury and Hutcheson. He declares that no one can be said to obey the law who does not know what the law enjoins, or who acts without reference to God and his law. At the same time, he seems to be a eudaimonist, and inclined to look on God as having an ultimate respect to happiness in his law. He has a second supplement, calm, moderate, and sensible, on the " Duties of Man towards his own Mind," and a third on " Quasi-Contracts."

His latest work, published in 1729, shortly before his death, is " Synopsis Theologiae Naturalis." In his preface he tells us that, in teaching pneumatology, he had used two Belgian textbooks. He advises that the forms of the Aristotelian school be avoided, as obscure and artificial, but declares at the same time that the doctrines of the scholastics, at least of the older, are more agreeable to reason and holy Scripture than those opposed to them in his day, especially in their finding a foundation for morality and obligation in God; and he denounces some who, of late years, with a showy appearance of genius and eloquence, would separate morality from religion, referring, I should suppose, to the school of Shaftesbury, against which, therefore, he thus gives his dying testimony, as it were in the name of. the old philosophy.

In establishing the existence and perfections of God, he draws arguments from a variety of sources. He would call in metaphysical principles. Thus he urges that there must be *ens aliquod independens*, otherwise we are landed in an infinite series of causes, which he declares (with Aristotle) self-evidently impossible. He appeals, with the French theologian Abbadie, {42} to universal consent. But he reckons the arguments of Descartes and De Vries, and that by Samuel Clarke, as unsatisfactory. He maintains that we can argue that what we attribute to a thing in idea exists, only after we have shown that the thing exists. He maintains that the existence of God as an existing being is to be established, not *a priori*, but *a posteriori*, and appeals to the traces of order, beauty, and design in the universe, and to the illustrations to be found in the writings of Ray, Pelling, Cheyne, Derham, Niewentite, and in Pitcairn on the Circulation of the Blood. He refers to the properties of matter, as established by Newton; and argues, as Baxter did so resolutely afterwards, that matter cannot move of itself, but needs a new force impressed on it. In regard to the dependence of creature on created power, he holds that things spiritual and corporeal exist so long as they have being from the creative efficacy of God, and speaks of the need of a divine *precursus* or *concursus*. He admits, however, that created spirits have efficacy in themselves. He refers to Leibnitz, and shows that he was well acquainted with his theory of possible worlds. It is surely interesting to observe a modest and retiring Scottish writer so thoroughly acquainted with the highest philosophy of his time, British and Continental, and yet retaining his own independence in the midst of his learning. If he cannot be regarded as the founder of the new school, he has the credit of judiciously combining some of the best properties of the old and new philosophy.

1875

VI. -- ANDREW BAXTER

BAXTER cannot be justly described as a leader or a follower of the Scottish school. His method is not really nor professedly that of inductive observation. He belongs rather to the school of Samuel Clarke, to whom he often refers, and always with admiration. But be was a Scotchman, and an independent thinker: he does not belong to the old philosophy; but he was a contemporary of the men who founded the Scottish school, and treated of many of the same topics. He had readers both in England and Scotland in his own day, and for some years after his death; and he deserves a passing notice as the representative of a style of thought which met with considerable favor in his time, but had to give way before the new school. {43}

We have a life of him in Kippis's " Biographia Britannica," drawn up from materials supplied by his son. He was the son of a merchant in Old Aberdeen, where he was born in 1686 or 1687. His mother was Elizabeth Frazer, descended from a considerable family in the north. He was educated at King's College, Aberdeen, where, at the beginning of last century, he would be trained in the old logic and metaphysics. But, as we shall see more fully in future articles, a considerable amount of a fresh literary taste, and of a spirit of philosophical inquiry, began to spring up in Aberdeen in connection with the two Universities pretty early in that century. Baxter, besides being a good mathematician, was well acquainted with the discoveries of Sir Isaac Newton, and with the theories of Leibnitz as to matter and motion. He was familiar with the Essay on the Human Understanding, but had a deeper appreciation of the speculations of Clarke.

The chief professional employment of his life was that of tutor to young men of good family. The boys who, in our days, would be sent to the great public schools of England taught by Oxford or Cambridge masters, were very often, in the seventeenth and eighteenth centuries, put under tutors, who went about with them to the colleges at home, or travelled with them abroad. The occupation of teaching and travelling tutor was one coveted by young men of limited means and of a reading taste, who did not wish officially to enter the church, and had no other office open to them than that referred to, fitted to furnish them with means of study. When the tutor had trained and travelled with the heir of a good estate, the family felt bound to make provision for him for life. It was thus that, in the seventeenth century, Hobbes had been tutor to two successive Earls of Devonshire; that, in the eighteenth century, Thomson the poet became tutor to the Lord Chancellor Talbot's son on the Grand Tour; that Hume coveted the office of travelling tutor to Murray of Broughton; and Turnbull and A. Smith gave up chairs in the Scottish colleges to become tutors, -- the one to the Wauchopes of Niddrie (?) and the other to the Duke of Buccleuch Baxter was tutor, among others, to Lord John Gray, Lord Blantyre, and Mr. Hay of Drummelzier.

In the spring Of 1741, he went abroad with Mr. Hay, having also Lord Blantyre under his care. He resided some years at Utrecht, and thence made excursions into Flanders, France, and Germany. Carlyle met him -- " Immateriality Baxter," as he calls him -- at Utrecht in 1745, and says of him, 'though he was a profound philosopher and a hard student, he was at the same time a man of the world, and of such pleasing conversation as attracted the young." His son bad described him as being at polite assemblies in Holland, and a favorite of ladies; but a writer in the Corrigenda of the following volume of the " Biographia," after mentioning that he saw him daily for more than two years at Utrecht, declares: " His dress was plain and simple, -- not that of a priggish French man, but of a mathematician who was not a sloven. I am pretty well persuaded that while in the Low Countries, he never had any conversation with women of higher or lower degree, unless it were to ask for the bill at an ordinary, or desire the servant maid to bring up the turf for his chimney." The same writer describes him as a "plain, decent, good humored man, who passed all his time, but {44} what was bestowed at his meals, in meditation and study." His son describes him as social and cheerful, and extremely studious, sometimes' sitting up whole nights reading and writing.

In 1724, he had married the daughter of Mr. Mebane, a minister in Berwickshire; and, while he was abroad, his wife and family seem to have resided at Berwick-on-Tweed. In 1747, he returned to Scotland, and resided till his death at Whittingham, in East Lothian, where he employed himself in country affairs, and in his philosophic studies. In his latter years, he was much afflicted with gout and gravel. In January 29, 1750, he wrote to (the afterwards notorious) John Wilkes, with whom he bad formed a friendship in Holland, " I am a trouble to all about me, especially my poor wife, who has the life of a slave night and day in helping to take care of a diseased carcass." He had long, be states, considered the advantages of a separate state, but " I shall soon know more than all men I leave behind me." He died April 13, 1750, and was buried in the family vault of Mr. Hay at Whittingham.

He wrote a book in two volumes entitled " Matho," being a compend of the universal scientific knowledge of the day. He published his principal work, " An Inquiry into the Nature of the Human Soul," in 1733,[10] and it reached a second edition in 1737. In 1750, shortly after his death, was published, "An Appendix to his Inquiry into the Nature of the Human Soul." He had taken a great body of manuscripts with him to Holland; in the letter referred to, he speaks fondly of his unfinished manuscripts, in which he had discussed " a great many miscellaneous subjects in philosophy of a very serious nature, few of them ever considered before, as I know of" In 1779, the Rev. Dr. Duncan of South Warnborough published from his manuscripts, after correcting the style, " The Evidence of Reason in proof of the Immortality of the Soul," and at the close is his letter to Wilkes. Another work of his, entitled " Histor," discussing, on the English side, the controversy between the British and Continental writers as to force, and on the side of Clarke, the controversy between Clarke and Leibnitz, was offered to Millar the bookseller; but the new generation did not appreciate his life-labors; his day was over, and the offer was declined.

The avowed design of Baxter, in all his works, is to establish the existence of an immaterial power. Such a defence seemed to him to be required, in consequence of the new views of the powers of matter founded on the discoveries of Sir Isaac Newton; by the equivocal language of Locke, frequently quoted about our not being "able to know whether any material being thinks or not;" and by the materialistic spirit abroad. The new doctrine of all matter attracting other matter seemed to show that we must be prepared to modify the old doctrine, that body is altogether passive. Leibnitz, on metaphysical grounds, and in opposition to the accepted Cartesian {45} doctrine, had maintained that matter has an essential potency. Baxter proceeds on the doctrine of

Clarke, the friend of Newton, and quotes his language. "All things that are done in the world are done either immediately by God himself, or by created intelligent beings; matter being evidently not at all capable of any laws or powers whatsoever, any more than it is capable of intelligence, excepting only this one negative power, that every part of it will always and necessarily continue in that state, whether of rest or motion, wherein it at present is. So that all those things which we commonly say are the effects of the natural powers of matter and laws of motion, of gravitation, attraction, or the like, are indeed (if one will speak strictly and properly) the effects of God's acting continually and every moment, either immediately by himself, or mediately by some created intelligent being," The first volume of Baxter's work on the "Nature of the Soul," his "Appendix" and a large part of his "Evidence," are mainly occupied with a full elucidation and elaborate defence of the views summarily expressed in this passage.

He labors to prove that a *vis inertiae*, or resistance to a change of present state of rest or motion, is essential to matter; that matter hath this and nothing else; that it cannot have any sort of active power; that what are called the powers of matter is force impressed upon it *ab extra*. He maintains that matter is "liable to but one change or casualty, viz., to be annihilated, or to be destroyed by a Being to whose power that effect is competent," and lie denies that Infinite Power may " superadd a property to a substance incapable of receiving it." He maintains this doctrine as resolutely as if it were the foundation of religion, which must stand or fall with it. The questions which he has taken up had been discussed in a profound manner by Descartes and Leibnitz, and they cannot be regarded as settled at this day. But from his dogma of the impotency of matter he argues the necessity of an immaterial powerful being who first made the dead substance, matter, who originally impressed, and still continues to impress, motion upon it. " I am of opinion, and think it would be easy to show it, if one bad leisure to run through the several particulars, that unless an immaterial power continually re-excited motion in the material universe, all would stop in it in a very short time, perhaps in half an hour, except that the planets would run out in straight-lined directions" ! ! "To say that Deity interposes when he sees that matter would go wrong, is the same thing, in other words, as owning that lie interposes always if that were proper. Every particle of matter resists a change of its present state, and therefore could not effect a change of state in itself nor in other particles." He would thus establish his conclusion, that the " Deity, who can be excluded from no place, but is active and present everywhere, acts immediately on all the parts of matter," and that his governing is only his creating power constantly repeated. "Our philosophy can only be consistent when we take in the immediate power of the Creator as the efficient cause in all the works of nature." He looks on his own position as being very much superior, in its religious aspects, to the doctrines which had been entertained by many others. " Low and pitiful are the shifts we are put to when we would remove the Deity to the head of nature, and the head of nature out of sight." {46}

"It is not right to exalt the Deity in words and derogate from his perfections in facts. This is only paying him a compliment, and then setting aside his government in whole or in part, -- a state artifice. Cicero objects this low cunning to Epicurus, when he says, it is " verbis ponere re tollere." " Descartes, before Spinoza, had given the government of the universe to matter and motion; and Leibnitz, under a pretence of extolling the original contrivance of things, leaves the execution of all this to dead substance. According to all these schemes, we see nothing that the Deity does now: we behold only the operations of matter. This fills the mind with anxious doubts. If matter performs all that is wonderful, it catches our first admiration; and we know not where to search for the being who contrived that which we see matter executes with such dexterity." Much may be said in

favor of the doctrine, that God acts in all physical action; but it is wiser not to found it on the peculiar dogma of Baxter, that matter is inactive.

But the grand aim of Baxter, in depriving matter of its powers, is to establish the immateriality, and consequent immortality, of the soul. It is a fundamental position with him, that "a power always belongs to something living." He is thus able to establish the existence of a human soul active and immortal. He maintains that " no substance or being can have a natural tendency to annihilation or become nothing," and argues that the soul must endlessly abide an active perceptive substance, without either fear or hopes of dying, through all eternity." When we find such positions coolly assumed, one almost feels justified in rejoicing that in that very age David Hume rose up to dispute all such dogmas; and that in the following age Emmanuel Kant examined narrowly the foundations both of rational theology and of rational psychology. We are certainly warranted in feeling a high gratification that Thomas Reid, a wiser man than any of these, did immediately after the time of Hume, and before the time of Kant, set about establishing natural religion and philosophy upon a safer foundation.

Baxter is prepared to follow out his principles to all their consequences, however preposterous they might appear. The phenomena of dreaming came in his way, and he gives an explanation of them. He cannot refer these dreams to dead matter, nor can it be the soul that forms the scenes present to it. His theory is, that separate immaterial beings act upon the matter of our bodies, and produce on the sensory a [Greek term] or vision, which is perceived by the active and recipient mind. He acknowledges that he knows nothing of the conditions and circumstances of these separate agencies, but he evidently clings to the idea that there is no scarcity of living immaterial beings, and asks triumphantly: "Why so much dead matter, without living immaterial substance in proportion? " " Hath not the most despicable reptile animalcule an immaterial soul joined to it?"

It ought to be added, that in his " Evidence " be adduces stronger arguments, than those derived from his favorite view of matter, in favor of the soul's immortality. He shows that if there be no state beyond the grave, our existence is incomplete, without design, irrelative; and he calls in the divine perfections as furnishing 'a certain ground of confidence that our existence will not be finally broken off in the midst of divine purposes thus visibly unfinished here," and securing that beings "becoming good for {47} something should not instantly become nothing." In arguing thus, be shows his besetting tendency to take up extreme positions; for lie maintains that in our world pain is much more extensive in its nature than pleasure, and that all bodily pleasures are merely instigations of pains. He argues that as in this world reason may often be disobeyed with no evil consequences and obeyed without any good ones, so there must be a future world to make every thing consistent with reason. He shows that the prepossessions of mankind are in favor of this tenet. " In the very dawnings of reason, let a child be told what is death, having no idea of any way of existing beside the present, amazement seizes him: lie is perplexed, uneasy, dismayed." He is met, as so many others have been, by the objection, that most of these arguments would prove that brutes are immortal. In answering it, he is obliged to allow that immortality does not depend solely on immateriality, and to throw himself on the moral argument, which does not apply to brutes, which, not being moral agents, are not capable of rewards and punishments. But it is clear that he cherishes the idea that the immaterial part of brutes, while not constituting the same conscious being, may not perish ultimately when separated from the material frame.

In treating of these favorite topics, he discusses a great many important philosophic questions, and always gives a clear and decided opinion. He evidently favors the arguments derived from "abstract reason and the nature of things" in behalf of the divine existence. He argues the necessity

of an infinitely perfect intelligent being, -- not only from space and time, as Clarke did, but from the necessity of eternal truth in geometry or in other abstract sciences." Truth is not a being existing by itself, and therefore the immutable necessary nature of truth must be referred to some being existing of itself, and existing immutably and eternally." We have only to define truth as the conformity of our ideas to things, to see the fallacy lurking in this argument.

His view of space and time is taken from Newton and Clarke. He represents them as not beings, but the affections of beings: " And as time and space are not existences, so their correlate infinites (if I may say so), that is, eternity and immensity, are not existences, but the properties of necessary existence." In some other of his statements, be goes back to some of the mystic statements of the schoolmen, and anticipates some of the doctrines of Kant. "God's existence is unsuccessive." He says, "*Nunc stans* implies opposite ideas, if applied to our existence; but if we allow an eternal and immutable mind, the distinction of past and future vanishes with respect to such a mind, and the phrase has propriety." But surely there is an inconsistency in first arguing the divine existence from our ideas of space and time, and then declaring that our ideas in regard to space and time do not apply to Deity.

In maintaining that mind is ever active, he has to consider its seeming dormancy in sleep. "The soul in sleep seems to suffer something like what happens to a live coal covered up under ashes; which is alive all the while, but only appears so when disencumbered and exposed to open air." As to what has since been called unconscious mental action, his theory of it is the same as that defended in after years by D. Stewart; he supposes {48} that the mind was conscious of its action at the time, but that the memory could not recall it. "There is certainly a great deal of our past consciousness which we retain no memory of afterwards. It is a particular part of our finite and imperfect nature, that we cannot become Conscious of all our past consciousness at pleasure. But no man at night would infer that he was not in a state of consciousness and thinking at such a certain minute, about twelve o'clock of the day, because now perhaps he hath no memory what particular thought be had at that minute. And it is no better argument, considered in itself, that a man was not conscious at such a minute in his sleep because next morning he hath no memory of what ideas were in his mind then."

Baxter was most earnest in restricting the properties of matter, but he was equally resolute in maintaining its existence. In his work on the soul he has a long section on " Dean Berkeley's scheme." He was one of the first who examined systematically the new theory. He takes the obvious and vulgar view of it, and not the refined one ascribed to the ingenious author by his admirers: for those who have opposed Berkeley have usually given one account of his system, while those who have defended him have usually given another; and some have thence come to the conclusion, that his whole theory is so ethereal that it is not capable of definite expression. Baxter maintains that " we perceive, besides our sensations themselves, the objects of them that " we are conscious not only of sensation excited, but that it is excited by some cause beside ourselves," and that "such objects as rivers, houses, mountains, are the very things we perceive by sense." He endeavors to prove that the system of Berkeley carried out consistently would land us in a solitary egoism, for " we only collect concerning the souls of other men from the spontaneous motions and actions of their bodies; these, according to him, belong to nothing." Berkeley had boasted that, by expelling matter out of nature, he had dragged with it so many sceptical and impious notions; Baxter replies that this " puts us into a way of denying all things, that we may get rid of the absurdity of those who deny some things," -- " as if one should advance that the best way for a woman who may silence those who attack her reputation is to turn a common prostitute." He thinks that the doctrine may tend to

remove the checks to immorality; for "he who thinks theft, murder, or adultery nothing real beyond bare idea, and that for aught we know be injures nobody, will be surely under less restraint to satisfy his Declinations of any kind." The mathematician is evidently annoyed and vexed at the attacks which Berkeley bad made on his science, and shows "that if there be no such thing as quantity, we have a large body of immutable truths conversant about an impossible object."

In examining Berkeley he gives his views of sense-perception, which are not so clear and satisfactory as those of Reid; but are vastly juster than those of his contemporaries. He distinctly separates himself from those who hold that the mind can perceive nothing but its own states. " If our ideas have no parts, and yet if we perceive parts, it is plain we perceive something more than our own perceptions." He adds "We are conscious that we perceive parts as that we have perceptions at all." The {49} existence of matter in general, or at least of material sensories to which the soul is united, seems to me to be nearer intuitive than demonstrative knowledge." He declares that the "same perception of parts proves to us both the spirit and a material agency." This is so far an anticipation of the doctrine of Hamilton as an advance upon that of Reid. As to the manner of the action of matter on spirit, and spirit on matter, he says, in the very spirit of Reid. " We are certain this is matter of fact in many instances, whether we conceive it or not." He adds, in his own manner: " The Deity himself moves matter in almost all the phenomena of nature, and the soul of man perhaps moves some matter of the body, though in an infinitely less degree."

The Scottish Philosophy

James McCosh
1875

VII. -- FRANCIS HUTCHESON.[11]

DURING the greater part of the seventeenth century there was a constant immigration into the north-east of Ireland of Scotch men, who carried with them their hardy mode of life and persevering habits; their love of education and their anxiety to have an educated ministry; their attachment to the Bible and the simple Presbyterian worship. This movement commenced with the attempt of the first James of England to civilize Ireland by the Plantation of Ulster, and was continued during the period of the prelatic persecution in Scotland, whereby not a few sturdy adherents of the Solemn League and Covenant were driven for refuge to the sister isle. The Scottish Church kept a watchful guardianship over her scattered children, and sent after them a succession of ministers to preach the gospel, for a time in the Established Church, and, when churchmen from England (such as Jeremy Taylor) would not tolerate this any longer, to set up a Presbyterian organization. Among these was the Rev. Alexander Hutcheson, the second son of an old and respectable family at Monkwood, in Ayrshire, who became minister at Saintfield, in the heart of county Down, and purchased the townland of Drumalig. His second son ' 'John, was settled at Ballyrea, within two miles of Artnagh, and ministered to a Presbyterian congregation in the archiepis opal city, where he {50} was known by his church as a man of retiring habits and of superior abilities, and a firm supporter of Calvinistic doctrine. His second son, Francis, was born Aug. 8, 1694, it is said in his grandfather's house in Drumalig.[12] When about eight years of age, he (with his elder brother, Hans) was put under the care of the same grandfather, and attended a classical school kept by Mr. Hamilton in the "meeting house" at Saintfield. He was afterwards sent to Killyleagh, in the same county, to an academy kept by the Rev. James Macalpin, said to be a man of virtue and ability, and who taught the future metaphysician the scholastic philosophy. We have it on record, that the Presbyterian Church of Ireland -- seeking now, after coming through a long period of harassment and trouble, to work out its full educational system --did about this time set up several such schools for philosophy and theology. However, the great body of the young men intending for the ministry did then, and for more than a century after, resort to the University of Glasgow for their higher education. Of this college Hutcheson became a student about 1710 (he does not seem to have matriculated till 1711). During his residence with his grandfather he became such a favorite with the old man, that when he died in 1711, it was found that he bad altered a prior settlement of his family affairs, and, passing by the older grandson, had left all his landed property to the second. Francis, though a cautious, was a generous youth: he had all along taken pains, even by means of innocent artifices, to uphold his brother in the old man's esteem; and now he refused to accept the bequest, while Hans, with equal liberality, declined to receive what had

been destined for another; and the friendly dispute had at last to be settled by a partition of the lands, which again became united when Hans, dying without issue, left his share to the son of Francis.

Francis Hutcheson thus sprang, like Gershom Carmichael (and we shall afterwards see George Turnbull), from the old {51} orthodox Presbyterian Church and its educated pastors; and both were early nurtured in the scholastic logic, from which they received much benefit. But Hutcheson comes an age later than Carmichael, and falls more thoroughly under the new spirit which has gone abroad.

At Glasgow the youth followed the usual course of study in the classical languages and philosophy, and enjoyed the privilege of sitting under the prelections of Carmichael. In after years, when called back to be a professor in the college, he gives in his Introductory Lecture a glimpse of the books and branches in which he felt most interest in his student life. After referring to the pleasure which he experienced in seeing once more the buildings, gardens, fields, suburbs, and rivers' banks (more pleasant then than now), which had been so dear to him, he expresses the peculiar gratification which he felt in revisiting the place where he had drunk the first elements of the quest for truth; where Homer and Virgil, where Xenophon, Aristophanes, and Terence, where the philosophy of Cicero and the discussions of the Fathers, had been opened to him; and where be had first been taught to inquire into the nature and reasons (*rationes*) of virtue, the eternal relations of number and figures, and the character of God. Having taken the Master's degree in 1712, he entered, the following year, on the study of theology under Professor John Simson. This professor was at that time, and, indeed, for the greater part of the period from 1712 to 1729, under prosecution before the ecclesiastical courts for teaching doctrines inconsistent with the Confession of Faith. It appears from the charges brought against him, and from his shuffling and vacillating explanations (he was often in a shattered state of health), that he took a favorable view of the state of the heathen; that he was inclined to the doctrine of free-will; he maintained that punishment for original sin alone was not just; he held that rational creatures must necessarily seek their chief good, -- always under subserviency to the glory of God, who cannot impose a law contrary to his own nature and to theirs, and who cannot condemn any except those who seek their chief good in something else, and in a different way than God has prescribed: but the special charge against him was, that he denied that Jesus Christ is a necessarily existent being in the same sense as the Father is. The lengthened process {52} concluded with the General Assembly declaring, in 1729, that Mr. Simson was not fit to be intrusted with the training of students for the ministry. It does not appear that young Mr. Hutcheson ever threw himself into this agitation on the one side or other, but it doubtless left its impression on his mind; and this, I rather think, was to lead him to adopt, if not the doctrine, at least some of the liberal sentiments of Simson; to keep him from engaging in religious controversy, and to throw him back for certainty on the fundamental truths of natural theology and the lofty morality of the New Testament.

To the teaching of Simson the historians of the Church of Scotland are accustomed to trace the introduction of the " New Light " theology into the pulpits both of Scotland and Ulster. But there were other and deeper causes also at work, producing simultaneously very much the same results all over the Protestant Continent of Europe, and in England both in the Church and among Non-conformists. It was a period of growing liberality of opinion, according to the view of the rising literary men of the country. It was a time of doctrinal deterioration, followed rapidly by a declension of living piety, and in the age after of a high morality, according to the view of the great body of earnest Christians. In the preceding age, Milton, Newton, and Locke had abandoned the

belief in the divinity of Christ, and the great Church of England divine of that age, Samuel Clarke, was defending the Arian creed, and setting aside the Reformation doctrine of grace. Francis Hutcheson, by this time a preacher, writes from Ireland to a friend in Scot land, in 1718, Of the younger ministers in Ulster: "I find by the conversation I have had with some ministers and comrades, that there is a perfect Hoadley mania among our younger ministers in the north; and, what is really ridiculous, it does not serve them to be of his opinions, but their pulpits are ringing with them, as if their hearers were all absolute princes going to impose tests and confessions in their several territories, and not a set of people entirely excluded from the smallest hand in the government anywhere, and entirely incapable of bearing any other part in the prosecution but as sufferers. I have reason however, to apprehend that the antipathy to confessions is upon other grounds than a new spirit of charity. Dr. Clarke's work (on the Trinity), I'm sufficiently informed, has made several {53} unfixed in their old principles, if not entirely altered them." Hutcheson never utters any more certain sound than this on the religious controversies of his day. It is evident that his mind is all along more inclined towards ethical philosophy and natural theology. It is interesting to notice that, in 1717, he wrote a letter to S. Clarke stating objections to his famous " Demonstration of the Being and Attributes of God," and that he received a reply, both of which are lost. We are reminded that, about four years before this, Joseph Butler, then a youth of twenty-one, at a dissenting academy, had written Clarke, taking exception to certain points in his "Demonstration," and had received answers to his letters. The objections of Hutcheson must have been more fundamental as to method than those of Butler. He was convinced that, as some subjects from their nature are capable of demonstration, so others admit only of probable proof, and he had great doubts of the validity of all metaphysical arguments in behalf of the existence of Deity. Dr. Leechman tells us: "This opinion of the various degrees of evidence adapted to various subjects first led Dr. Hutcheson to treat morals as a matter of fact, and not as founded on the abstract relation of things."

During his student life he was tutor for a time to the Earl of Kilmarnock. Leaving college about 1716, he was licensed to preach the gospel by the Presbyterian Church in Ireland. His preaching does not seem to have been acceptable to the people, who were alarmed at the New Light doctrine which was creeping in among them, and felt that the young preacher's discourses were scarcely in the spirit of the Scriptures, as they were not after the model of the ministers and divines whom they reverenced.[13] However, he received a call from a country {54} congregation at Magherally, in his native county, but was easily persuaded to accept instead an invitation to open an academy in Dublin, to give instruction in the higher branches. About the time he settled there the Protestant Non-conformists, aided by the government, but after a keen opposition from the Irish bishops, had succeeded in obtaining a parliamentary repeal of the Acts which required all persons to resort to their parish church every Sunday, and imposed a fine of L100 upon the dissenting minister who officiated in any congregation. But the young teacher had to suffer two prosecutions in the Archbishop's court for daring to teach youth without subscribing the canons and obtaining a license. These attacks upon him came to nothing, as they were discouraged by the Archbishop. Dr. King, author of the metaphysical work on the " Origin of Evil," who, though he had been a determined opponent of the relaxation allowed by law to dissenters, was unwilling to oppress so accomplished a man and well-disposed a citizen as Hutcheson. In Dublin he had laborious duties to discharge, which left him, he complained, little time for literature and mental culture; but he seems to have met with congenial society. The Presbyterians and Independents were the representatives of the English Non-conformists, who had been a considerable body there when Henry Cromwell

was vice-regent, and when Winter and Charnock preached to them in Christ's Church Cathedral; and they had among them families of standing and influence. His literary accomplishments opened other circles to him. There seems to have been at that time a considerable taste for learning and philosophy in the metropolis of Ireland. From a very early date after its publication, the " Essay on the Human {55} Understanding," had been most enthusiastically welcomed by Molyneux, who corresponded with Locke, and expressed his excessive admiration of him. Berkeley, the tutor of Molyneux's son, began in 1707 to give to the world his ingenious speculations on mathematical and philosophical subjects. It does not appear that Hutcheson was acquainted with Berkeley, who, we rather think, would not appreciate the views of Hutcheson: be has certainly condemned the opinions of Shaftesbury. But he enjoyed the friendship of a number of eminent men, including Viscount Molesworth and Dr. Synge afterwards Bishop of Elphin; both of whom encouraged him to publish his first work, and assisted him in preparing it for the press. The former connects him historically with Shaftesbury, who had written letters to Molesworth, which were published in 1721. When in Dublin, Hutcheson and some others formed a club in which papers were read by the members on philosophic themes. It is an interesting circumstance, that in the next age some of the more important works of Gerard, Reid, Beattie, and Campbell sprang out of a similar society in Aberdeen.

It was in 1725 that he published in London his first work, "An Inquiry into the Original of our Ideas of Beauty and Virtue." The treatise was published anonymously, as (so he tells us in the second edition) he had so little confidence of success that he was unwilling to own it. The subject, the thoughts, and the style were suited to the age; and the work was favorably received from the first. Lord Granville (afterwards Lord Carteret), the Lord Lieutenant of Ireland, sent his private secretary to inquire at the bookseller's for the author; and when he could not learn his name he left a letter to be conveyed to him, in consequence of which Hutcheson became acquainted with his Excellency and was treated by him with distinguished marks of esteem. A second edition, corrected and enlarged, was called for in 1726.

This was the age of serial literary essays which had commenced in England with the "Tatler" and "Spectator." There was such a periodcal set up in the metropolis of Ireland called the "Dublin Journal" conducted by Hibernicus (Dr. Arbucle), and to this paper Hutcheson sent two letters, of date June 5th and June 12th, 1725, on " Laughter," in opposition to the views of Hobbes, who attributed men's actions to selfish motives, and {56} represented laughter as nothing else but sudden glory arising from some sudden conception of some eminency in ourselves, by comparison with the infirmity of others or our own formerly. He characterizes Hobbes as "having fallen into a way of speaking which was much more intelligible than that of the School men," and "so becoming agreeable to many wits of his age;" and as "assuming positive, solemn airs, which he uses most when he is going to assert some solemn absurdity or some ill natured nonsense." He finds it difficult to treat the subject of laughter "gravely," but gives his theory of the cause of laughter, which is "the bringing together of images which have contrary additional ideas, as well as some resemblance in the principal idea g, this contrast between ideas of grandeur, dignity, sanctity, perfection, and ideas of meanness, baseness, profanity, seems to be the very spirit of burlesque, and the greater part of our raillery and jest are founded on it." Some such view as this has ever since been given of wit. Samuel Johnson describes it as a sort of *Concordia discors or concors discordia*. Hutcheson ventures to specify the use of laughter: "Our passions are apt to lead us into foolish apprehensions of objects both in the way of admiration and honor, and ridicule comes in to temper our minds." This moderate view falls considerably short of that given by Shaftesbury, who

represents ridicule as a test of truth.

Mandeville, in "The Fable of the Bees," had advanced some curious and doubtful speculations as to private vices being public benefits; showing that the power and grandeur of any nation depend much upon the number of people and their industry, which cannot be procured unless there be consumption of manufactures; and that the intemperance, luxury, and pride of men consume manufactures, and promote industry. The author has here caught hold of a positive and important truth, the explanation of which carries us into some of the deepest mysteries of Providence, in which we see good springing out of vice, and God ruling this world in spite of its wickedness, and by means of its wickedness, but without identifying himself with it. But Mandeville was not able to solve the profound problem, and in dealing with it he uses expressions which look as if he intended to justify, or at least to palliate vice. Hutcheson hastens to save morality, and writes letters on the subject to Hibernicus, {57 } and easily shows that virtue tends to private and public happiness, and vice to private and public misery; and that there "would be an equal consumption of manufactures without these vices and the evils which flow from them."

Hutcheson had now tasted the draught of authorship, and must drink on. In the "London Journal" for 1725 there appeared some Letters signed "Philaretus," containing objections to the doctrine of the "Inquiry into the Ideas of Beauty and Virtue," which is represented as not giving a sufficiently deep view of virtue as founded on the nature of things and perceived by reason. Hutcheson replies in the same journal. In that same year he published his second great work, being " An Essay on the Nature and Conduct of the Passions and Affections, with illustrations of the Moral Sense." In the Preface he says, " Some Letters in the ' London journal,' in 1728, subscribed 'Philaretus,' gave occasion to the Fourth Treatise (on the Moral Sense); the answer given to them in these weekly papers bore too visible marks of the hurry in which they were wrote, and therefore the author declined to continue the debate that way, choosing to send a private letter to Philaretus to desire a more private correspondence on the subject of our debate. He was soon after informed that his death disappointed the author's great expectations from so ingenious a correspondent." Philaretus turned out to be Gilbert Burnet (second son, I believe, of the bishop), and the correspondence was published in 1735, with a postscript written by Burnet shortly before his death. Burnet examines Hutcheson from the stand-point of Clarke, and fixes on some of the weak points of the new theory.

At this time there was a keen controversy in Ulster as to whether the Presbyterian Church should require an implicit subscription to the Westminster Confession of Faith, and this issued in those who refused to subscribe forming themselves into a separate body called the Antrim Presbytery, the members of which published a " Narrative of the Proceedings of the Seven Synods," which led to their separation. The work of replying to this document was committed to Mr. Hutcheson, of Armagh, whose paper, however, was not published till after his decease, which took place in February, 1729. The old man had anxieties about his son, lest he should be tempted by the flattering attentions paid him in Dublin to conform to the Established {58} Church, and wrote a letter expressing his fears. We have the reply of the son, of date Aug. 4, 1726. In this he avows that he did not regard the "government or externals of worship so determined in the gospel as to oblige men to one particular way in either:" that he looks upon the established form as an "inconvenient one;" that he reckons the dissenters' cause "in most disputed points the better;" that he believes the original of both civil and ecclesiastical power is from God; he denounces those religious penal laws which "no magistrate can have a right to make;" but he would not blame any man of his own principles who did conform, if the "ends proposed were such as would over-balance the damage which the more just cause would sustain by his leaving, particularly if he had any prospect of an

unjust establishment being altered," of which, he confesses, he does not see the least probability. He says, that both Lord Cathcart and the Bishop of Elphin had professed their desire to have him brought over " to the Church, to a good living; " that he kept his mind "very much to him self in these matters, and resolved to do ," but that he had no intention whatever to depart from his present position, and that he would feel it his duty continually to promote the cause of dissenters. I rather think that this frank but expediency letter would not altogether satisfy the good old father, who had stood firm on principle in trying times. I have referred to these transactions, because they exhibit the struggles which were passing in many a bosom in those times of transition from one state of things to another. Hutcheson never conformed, as his contemporary Butler did, to the Church. His Presbyterian friends were soon relieved from all anxieties in this direction by his being appointed, after be had been seven or eight years in Dublin, to an office altogether congenial to his tastes, in Glasgow University, where, however, he exercised a religious influence which his father, provided he had been spared to witness it, would have viewed with apprehension and disapproval.

He was chosen to succeed Carmichael, Dec. 19, 1729, by a majority of the Faculty, over Mr. Warner, favored at first by the principal, and over Mr. Frederick Carmichael, son of Gershom, supported by five of the professors. His appointment could be justified on the ground of merit; but he owed it mainly {59} to family connections, who gained Lord Isla, the great government patron of the day, before whom the principal had to give way.[14] In October, 1730, twenty English students have come to the college, expecting Mr. Hutcheson -- whose " Inquiry " and work on the " Passions " were already well known -- to " teach morality Professor Loudon, however, insisted that he had a right to take the chair of Moral Philosophy, whereupon the English students gave in a paper declaring that, if Mr. Hutcheson, who had not yet come over from Ireland, did not teach them morality, they would set off to Edinburgh, and Mr. Loudon had to yield. On November 30, he was publicly admitted, and delivered, in a low tone and hurried manner, as if awed and bashful, an inaugural discourse, "De Naturali Hominum Socialitate," in which he expounds, in a clear and pleasant manner, and in good Latin, his favorite doctrine as to man having in his nature disinterested affections. He maintains, in opposition to the "very celebrated" Locke, that man has something natural, but admits that it requires time and circumstances to bring it forth; and in opposition to Hobbes and Puffendorff, that man can be swayed by other motives than self-love. He represents the conscience as the [Greek term] to which all our nature ought to be subjected, and to which it had been subjected in our entire state; but admits that our nature is fallen, weakened, and corrupted, in many ways. Hutcheson lectured five days a week on his proper course, which embraced Natural Religion, Morals, jurisprudence, and Government; and at another hour he read three days of the week, with his students, some of the finest writers of antiquity, Greek and Latin, on the subject of morals; interpreting both the language and sentiment. This practice of combining reading with lectures was followed by his successors in the moral chair in Glasgow, and is vastly superior to the plan of the Edinburgh professors of a later date, who instructed their pupils only by reading lectures. His prelections were at first, after the manner of the times, in Latin; but he had the courage to break off from the ancient custom, and to speak in the English tongue, no doubt to the great joy and benefit of the students, who might lose somewhat in not being familiarized with the ancient learned language; but would gain vastly more in being brought into close sympathy with the {60} speaker, in listening from day to day to elegant English, and in the mastery which they would thereby acquire over their own tongue. Dr. Carlyle has left us a picture of the lecturer: "I attended Hutcheson's class this year (I 743-44) with great satisfaction and improvement. He was

a good-looking man, of engaging countenance. He delivered his lectures without notes, walking backwards and forwards in the area of his room. As his elocution was good, and his voice and manner pleasing, he raised the attention of his hearers at all times; and when the subject led him to explain and enforce the moral virtues, he displayed a fervent and persuasive eloquence which was irresistible." A like account is given of him by his professed biographer Leechman: "A stature above middle size, a gesture and manner negligent and easy, but decent and manly, gave a dignity to his appearance. His complexion was fair and sanguine, and his features regular. His countenance and look bespoke sense, spirit, kindness and joy of heart," It may be added that this is the very impression left as we gaze on his portrait, with wig and gown, with florid face, and easy but dignified air, in the common hall of Glasgow College. Leechman represents him as dwelling in his lectures in a more diffuse manner on such moral considerations as are suited to touch the heart, and excite a relish for what is truthful and noble; and by his vivacity of thought, and sensibility of temper, commanding the attention of his students, and leaving strong impressions on their minds.

In the college he had an eminent colleague in Mr. Robert Simson (nephew of the theological professor), and a congenial one in Mr. Alexander Dunlop, the professor of Greek. Mr. Simson was an eccentric man, who spent his time between severe geometrical studies in the morning, and social meetings in the tavern at which he lived, or in his club, in the evening. Hutcheson and Dunlop -- who was a man of strong sense and capacity for business -- got the credit of managing all the affairs of the university, and both exerted themselves to maintain the discipline of the college and foster its literary tastes. In particular, Hutcheson had great success in reviving the study of ancient literature, particularly the Greek, which had been much neglected in the university before his time. At a later date, he had associates of a kindred spirit in the elegant {61} and grave Dr. Leechman, professor of theology (afterwards principal); in the lively and learned Dr. Moor, first the librarian of the college, and in 1746 made professor of Greek; and in the two eminent printers, Robert and Andrew Foulis, who published a multitude of learned works, including many of Hutcheson's. With such a spirit reigning in the college, and a great thirst for education on the part of the Scottish youth, fostered by the parish and burgh schools, the class-rooms were filled with students. Carlyle, who had just come in 1743 to Glasgow, after having been at Edinburgh College, describes the spirit that reigned among the youths: "Although at the time there appeared to be a marked superiority in the best scholars and most diligent students of Edinburgh, yet in Glasgow learning seemed to be an object of more importance, and the habit of application was much more general," -- a description which applies equally to Glasgow in after years. He mentions that among the students there were sundry young gentlemen from Ireland, with their tutors; and he names, among young men of station attending, Walter Lord Blantyre, Sir -- Kennedy and his brother David, afterwards Lord Cassilis. Walter Scott of Harden, James Murray of Broughton, and Dunbar Hamilton, afterwards Earl of Selkirk. The Scotch colleges were quite competent at that time to educate the nobility of the country, who had not yet fallen into the way of going to the great English schools and colleges, there to lose their national predilections and become separated, as they did in succeeding ages, from the sympathies, social, political, and religious, of the middle classes and common people of Scotland, to the great injury of the church and the nation generally.

Hutcheson exercised a special influence in drawing students, Scottish, Irish Presbyterian, and English Non-conformist, to the college. His own class was so large that he had to employ an assistant. The Calvinistic creed of the south-west of Scotland, the theological preaching of the old-school ministers, and the training of the young in the Shorter Catechism, all inclined the students to mental philosophy; and in Hutcheson they had much to attract, and little to offend.

When he set before them wide fields of knowledge; when, in his lectures on natural theology, he pointed out evidences of the wisest contrivance and {62} most beneficent intention; when he led them from the external world into the still greater wonders of the internal, and traced the parts of man's moral constitution, and described the virtues in their loveliest form, and enlarged on the elevated enjoyments furnished by them; when he quoted, with glowing zest, the noblest passages of Greek and Roman literature; when he inculcated, with immense enthusiasm, the importance of civil and religious liberty, -- the students felt as if a new world were thrown open to them, and a new life kindled within them. Following the custom of his predecessor, he lectured on the sabbath evenings on the truth and excellence of Christianity, and the students of all the classes eagerly rushed to his prelections. The conversation of the youths in their social walks and visits often turned on the literary and philosophic themes which he discussed, and some of them chose to attend his lectures for four or five successive years. Among his pupils were Mr. Millar, afterwards President of the Court of Session; Archibald Maclaine, who in future years translated Mosheim's " Ecclesiastical History;" Matthew Stewart, famous for his Mathematical Tracts, and father of Dugald Stewart; and a youth, specially appreciated by Hutcheson, with a vast capacity for learning of every kind, and destined in future years to be so famous in Hutcheson's own department, -- Adam Smith, author of " The Theory of Moral Sentiments," and of " The Wealth of Nations." All of these ever spoke of Hutcheson in terms of high admiration and gratitude.

Defoe describes the city of Glasgow, with its four principal streets meeting in a cruciform manner at a point, as being, in 1726, one of the cleanliest, most beautiful, and best built cities in Great Britain. On the street that ran toward the north stood the college, completed in 1656, with quadrangles, arcade, and spire, built after the style of Louis XIII. and Louis XIV. The population, when Hutcheson was a professor, might be upwards of twenty thousand. At the summit of the social scale were the foreign merchants engaged in the American trade, in which they carried out linen and brought back tobacco " the tobacco merchants, with their scarlet cloaks and gold-headed canes, and cocked hats, perched on powdered hair or wig, with dangling clubtie or pigtail." Next to them, but at a considerable distance, were the ordinary shopkeepers; and farther {63} down, the tradesmen and servants; while at the base were the Highlandmen, with their tartan jacket and kilts, driven from their native hills by starvation, and ready to perform the most servile work. All classes made a solemn religious profession; but Wodrow mourns over degenerate customs which wealth and luxury were introducing. The better citizens dined early in their own homes, without show; and many of them spent their evenings in social meetings at taverns, -- a practice which gendered those drinking customs which, beginning with the upper classes about this time, went down to the peasant class in the days of Burns, and by the end of the century infected the whole of Scottish society, which has not yet recovered from the evil influence. But Hutcheson does not seem to have been much mixed up with the citizen life of Glasgow; we do not hear of his spending his evenings in the tavern, or being a member of any of the social clubs which began to spring up in Glasgow at this time. He had experience of the evil effects of the new habits (which were coming in with the new theology), in the lives of some of the Irish students who were committed to his care, and over whom he watched with the most friendly interest. "The wretched turn their minds take is to the silly manliness of taverns." He satisfies himself with keeping personally free from the evil. He presses his friend Tom Drennan, from Belfast, to pay him a visit for a month or six weeks, and promises: "Robert Simson, with you and Charles Moor, would be wondrous happy till three in the morning; I would be with you from five to ten."

His sphere was within the walls of the college; whence, how ever, his influence spread over the

educated mind of the south west of Scotland and of Ulster, and over not a few of the Non-conformists in England. Carlyle tells us that he was believed by the students to be a Socinian. There is no evidence of this, nor of his expressing any positive opinion on any doctrinal subject. Even in his Sabbath evening lectures he kept to Grotius "De Veritate Christianae Religionis," and avoided, Leechman tells us, " the party tenets or scholastic system of modern ages." He seems to have maintained a friendly communication with the non-subscribing Presbyterian ministers in Ireland, some of whom (such as Abernethy and Leland, and Bruce and Boyce) were as accomplished men as any theologians {64} of their age, and of whom it may be said to their credit, that they suffered in their temporal interests rather than subscribe articles which they did not believe. In particular, Hutcheson carried on a very genial correspondence with the Rev. Thomas Drennan, a non-subscribing minister at Belfast.[15] The ministers of this communion, more especially as they were often abandoned by the people when their views became known, were at times in very poor circumstances. On hearing this, Hutcheson writes to his friend (May 31, 1742) am concerned that in my prosperous circumstances I did not think of it sooner. If you have any little contributions made towards such as are more distressed than the rest, you may mark me as a subscriber for L5 *per annum*, and take the above ten pounds as my payment for two years past. . . . I think it altogether proper you should not mention my name to your brethren, but conceal it. I am already called New Light here. I don't value it for myself, but I see it hurts some ministers who are most intimate with me. I have been these ten days in great hurry and perplexity, as I have for that time foreseen the death of our professor, who died last Wednesday, and some of my colleagues join me in laboring for Mr. Leechman to succeed. We are not yet certain of the event, but have good hopes. If he succeed, it will put a new face upon theology in Scotland."

This was no doubt one of the ends for which Hutcheson lived and labored, "*to put a new face upon theology in Scotland*."[16] Discouraging all doctrinal exposition, and all rousing appeals to the conscience, he would have the preachers recommend the Christian religion as embracing a pure morality, and holding out the hope of a blessed immortality; but meanwhile providing no pardon to the poor sinner anxious about the past, nor gracious aid to help him in his struggles to deliver himself from sin in the future. Never avowing any doctrinal belief, his students {65} looked upon him as a Socinian, and so his influence went in that direction. The crop that sprang up may be taken as represented by such men as Carlyle, elegant and accommodating but dreadfully rankled by a Calvinistic creed which they had to swear, and by the opposition of the people, who could not be made to feel that the New Light was suited to them, or to believe that it had any title to be called a religion. But all this was in the future, and was not the precise result expected b), Hutcheson. Meanwhile he rejoices in Leechman, and describes him as one " who sees all I do." It seems that the Scotch divine received a call from a non-subscribing congregation in Belfast, and Hutcheson is rather inclined that he should go; he is so anxious to have him out of "that obscure place where he was so much lost," and where he was "preaching to a pack of horse-copers and smugglers of the rudest sort," who, we venture to say, would not profit much by that calm, abstract, elegant style which so pleased the professor of moral philosophy. Hutcheson uses every means to secure Leechman's appointment to the chair of theology in Glasgow, and brings influence of a very unscrupulous character (as I reckon it) to carry his point. He writes Mr. Mure of Caldwell (Nov. 23, 1743) that he wants a letter from the Duke of Montrose, the Chancellor of the University, in behalf of Leechman to Morthland, professor of Oriental languages, to be shown to others, and he malignantly mentions that Professor Anderson, the chief opponent of Leechman, " made himself ridiculous to all men of sense by dangling after Whitefield and M'Cullogh " (" Caldwell Papers ");

and he wants this to be specially known to Tweeddale, who was Secretary of State for Scotland, and to Andrew Mitchell, his private secretary' It seems that the advocates of liberality could not tolerate that a man should be favorable to a revival of religion. It was by such means that " a new face was to be put upon the theology of Scotland." He writes to his Belfast friend (Feb. 20, 1743-44): I could tell you a good deal of news upon the unexpected election of a professor of divinity, and the furious indignation of our zealots." He had written previously (March 5, 1738-39): "I hope Jack Smith has sent down to your town a 'Serious Address to the Kirk of Scotland,' lately published in London; it has run like lightning here, and is producing some effect; the author is unknown; 'tis wrote {66} with anger and contempt of the Kirk and Confession, but it has a set of objections against the Confession which I imagine few will have the brow to answer." The moderate party in the Church of Scotland is being crystallized by coldness out of the floating elements; and already there is a felt polar antipathy between them and those whom they choose to call " zealots." Hutcheson writes (April 16, 1746), " I would as soon speak to the Roman conclave as our presbytery."

The professor of theology introduced by him to the college, had signed the Confession of Faith, and professed his willingness to sign it at any time. He accomplished the end of Hutcheson. The subjects represented by him as suitable to be dwelt on by the preacher from the pulpit, were the perfections of God; the excellence of virtue, and the perfection of the divine law; the truth of the Christian religion, and the important purposes for which Jesus came into the world; the great doctrines he taught the interesting scenes of providence he has displayed to men the dignity and immortality of the soul, and the inconceivable happiness of the heavenly state. In the social circle he was grave and silent, but is represented by Carlyle as having a lively wife, who entertained the students that came to his house in the evening, and was anxious to hear about the new plays and novels which were coming into Scot land. He set out a body of young preachers, who unfortunately lost the common people, and the pious of all ranks, without gaining the worldly and unbelieving. He published a sermon in which he thought to recommend prayer as fitted to have an influence on the mind of the person praying, and submitted a copy to Hume, who told him plainly that the person praying must believe that his prayers have an influence on God and bring an answer.

It should be allowed that Hutcheson was most anxious to impart a taste for learning and refinement to the ministers of the Church of Scotland. He was deeply impressed with the evils which were springing from the law of patronage being now put in operation with a high hand. In 1735, he published " Considerations on Patronage, addressed to the Gentlemen of Scotland." In this pamphlet he predicts that, " instead of studying sobriety of manners, piety, diligence, or literature, one or other of which qualities are now necessary to recommend {67} the candidates to the favor of heritors, elders or presbytery, the candidate's sole study will be to stand right in politics, to make his zeal for the *ministry of state* conspicuous; or by all servile compliance with the humor of some great lord who has many churches in his gift, whether that humor be virtuous or vicious, to secure a presentation." He fears the mischiefs of patronage were but beginning to appear, and that gentlemen's sons will no longer devote themselves to the ministerial office, which will be sought by lads of mean parentage and circumstances. It is quite certain that, owing to the law of patronage, combined with the smallness of the livings, estimated by Hutcheson as at that time about L80 a year, and the influence of London court life, the upper classes (from which so many ministers had sprung in the previous century) ceased from this time to encourage their sons to enter the sacred office.

The recorded incidents of his person and family life are not numerous. He seems to have been

engrossed in lecturing to his students, in managing college matters, and in preparing text-books. He published a "Compend of Logic," a "Synopsis of Metaphysics," and "Institutes of Philosophy," all in clear and graceful Latin (referred to with commendation by Dr. Parr in his " Spital Sermon "). He joined Dr. Moor in publishing a translation of the " Meditations " of Antoninus, with a life of Antoninus, an introduction and notes in English, the last showing a considerable acquaintance with the Stoic philosophy.

When in Dublin, he had married Mary Wilson, daughter of Francis Wilson, a gentleman of property, and belonging to a Presbyterian family in Longford.' In a letter to a friend, Feb. 12, 1740, he speaks of himself as " having been married now fifteen years and having only one boy surviving, of seven children borne to me by a very agreeable woman. I bless God for the one he has spared to me, and that he has no bad genius. If he proves a wise and good man, I am very well in this world. Since my settlement in this college I have had an agreeable and I hope not an useless life, pretty much hurried with study and business, but such as is not unpleasant. I hope I am contributing to promote the more moderate and charitable sentiments in religious matters in this country, where yet there remains too much warmth, and commonly about matters of no great consequence to real religion. We must make allowance {68} for the power of education in all places, and have indulgence to the weakness of our brethren."[17]

So early, as June, 1741, he writes to his Belfast friend: " In short, Tom, I find old age, not in gray hairs and other trifles, but in an incapacity of mind for such close thinking and composition as I once had, and have pretty much dropped the thoughts of some great designs I had once sketched out." On April 3, 1745, he was nominated to the chair of moral philosophy in Edinburgh by the Town Council, but declined the honor, in consequence of not feeling strong enough to engage in new labors. He writes, April 16, 1746: "I am in a great deal of private distresses about Jo. Wilson and his sister, the latter in the utmost danger, the other scarce recovered from death; my wife, too, very tender; but, by a set of most intricate business, upon which the soul of this college depends, and all may be ruined by the want of one vote, I cannot leave this till after 26th June, and we go to Dublin first." He had been for some months in an uncertain state of health: he went to Dublin about the time mentioned in the letter quoted; and there, after a few days' fever, he was cut off, Aug. 8, 1746. His remains were buried in the old graveyard of Knockmark, East Meath, among his wife's kindred, the Wilsons and Stanhopes. He left one son, who became a physician, and rose to be professor of chemistry in Dublin College. That son published, in 1754, his "System of Moral Philosophy," to which is prefixed an account of the father's life by Dr. Leechman.

Hutcheson has nowhere explained very fully or formally the method on which he proceeds. But he everywhere appeals to facts; he brings all theories to the test of the actual operations of the human mind as disclosed to consciousness (a word frequently employed by him); he sets no value on speculations built up in any other way; and he everywhere speaks doubtfully or disparagingly of the logical distinctions and verbal subtleties of the schoolmen, and of the rational deductions of Descartes and Samuel Clarke. Proceeding on the method of observation, he discovers certain cognitive powers, which he {69} calls, perhaps unhappily, senses, which have a place in our very nature and constitution, and operate independent of any notice we may take of them. These features show that he belongs to the Scottish school, of which he is entitled to be regarded ,is the founder, inasmuch as no philosopher connected with North Britain had previously combined these characters, and as lie in fact gave the modern stimulus to philosophic speculation in Scotland.

He does not dwell at great length, nor very minutely, on the intellectual powers. He says that "late

inquiries have been very much employed about our understanding. and the several methods of obtaining truth and so he would rather investigate " the various pleasures which human nature is capable of receiving," and our various internal senses, perceptions, and affections, specially the sense of beauty and the moral sense. Still he intimates very clearly what views he takes of man's intellectual nature. And first, as to the senses, he says, " It is not easy to divide distinctly our several sensations into classes. The division of our external senses into the five common classes seems very imperfect. Some sensations received without any previous idea, can either be reduced to none of them, such as the sensations of hunger, thirst, weariness, sickness; or, if we reduce them to the sense of feeling,, they are perceptions as different from the other ideas of touch, such as cold, heat, hardness, softness, as the ideas of taste or smell. Others have hinted at an external sense different from all of these. The following general account may possibly be useful: (1) That certain motions raised in our bodies are by a general law constituted the occasion of perceptions in the mind. (2) These perceptions never come alone, but have some other perceptions joined with them. Thus every sensation is accompanied with the idea of duration, and yet duration is not a sensible idea, since it also accompanies ideas of internal consciousness or reflection; so the idea of number may accompany any sensible ideas, and yet may also accompany any other ideas as well as external senses. Brutes, when several objects are before them, have probably all the proper ideas of sight which we have without the idea of number. (3) Some ideas are found accompanying the most different sensations, which yet are not to be perceived separately from some sensible quality, {70} such as extension, figure, motion, and rest, accompany the ideas of sight or colors, and yet may be perceived without them, as in the ideas of touch, at least if we move our organs along the parts of the body touched. Extension, figure, motion, or rest, seem therefore to be more properly called ideas accompanying the sensations of sight and touch than the sensations of either of these senses, since they can be received sometimes without the ideas of color, and sometimes without those of touching, though never without the one or other. The perceptions which are purely sensible, received each by its proper sense, are tastes, smells, colors, sound, cold, heat, &c. The universal concomitant ideas which may attend any idea whatsoever are duration and number. The ideas which accompany the most different sensations are extension, figure, motion, rest. These all arise without any previous ideas assembled or compared g, the concomitant ideas are reputed images of something external. From all these we may justly distinguish those pleasures perceived upon the previous reception and comparison of various sensible perceptions with their concomitant ideas, or intellectual ideas, when we find uniformity or resemblance among them. These are meant by the perceptions of the internal sense." ("Nature and Con duct of the Passions," Sect. I.)

This note comprises the result and the sum of much reading and much reflection. The principal thoughts, more especially as to the separation of the ideas of number and duration, and of extension, figure, motion, and rest from our common sensations, are taken, directly or indirectly, from Aristotle's " Psyche," B. II. c. vi. (which is not referred to, however), where there is a distinction drawn between common and proper percepts. But he seems to take a step beyond Aristotle when he tells us here, and still more expressly in his " Logic," that number and duration can be perceived both by the external and internal sense. It has been felt by all profound thinkers, that in order to account for the phenomena, and to save the senses from deceiving us, there must be distinctions of some sort drawn between different kinds of sensations or perceptions. Adopting the distinction of Aristotle, we find him in his " Logic " identifying it with that of Locke, between the primary and secondary qualities of bodies. It may be doubted whether we can so {71} absolutely divide, as Aristotle and Hutcheson did, the accompanying ideas from the sensations or perceptions.

The sensations and ideas are in every case wrapped up in one concrete cognitive act, while, however, the may come tip in a different t, y concretion in our next experience, and may be separated into elements by an analytic process. I rather think, too, that the perception of extension (as has been shown by Hamilton) is involved in all our sense-perceptions, for we seem to know our organism as in space and localized by every one of the senses. The language about the motions of bodies constituting the *occasion* of the perceptions in the mind, proceeds upon the inadequate distinction between efficient and occasional cause, drawn by the disciples of Descartes, -- a distinction adopted by Reid as well as Hutcheson. I suspect that it still remains true, that the common division of our external senses is very imperfect, and that it is not easy to arrange our sensations into classes.

In regard to the question started in the next age by Reid, as to whether we perceive by the senses the external object, or an idea of it, it is certain that he accepts the view and the language of the great body of philosophers prior to his time, and he speaks of our perceiving by ideas " as images of something external."

Formal logic has been taught, I believe, in Glasgow University from its establishment in 1451 to this present time. Hutcheson has a "Logical Compendium" which was used as a text-book in Glasgow and elsewhere. In this treatise, after a meagre dissertation on the rise of philosophy, he defines logic as " the art of guiding the mind in the knowledge of things; adding, that it may also be considered a science, and that others define it " the art of discovering and declaring truth." These definitions will be regarded as too loose and vague by the rigid logicians of our time. In treating of the concept, notion, or idea, he represents ideas as being divided into sensations, imaginations, and pure intellections, -- a theory adopted by Gassendi, and favorably received by not a few for an age or two after the time of Descartes and Gassendi, as seeming to reconcile these two eminent men. Hutcheson had previously represented all sensation as external and internal, and declared, with Locke, that all our ideas arise either from the external sense or {72} from reflection. The intellections he defines as " any ideas not reached or comprehended by any bodily sense; " they are chiefly " suggested by the internal sense, and include our actions, passions, judgments, doubts, and the like, and also abstract ideas." There is an incongruous mixture here of the Lockian with an older theory. The ideas derived from reflection, which are all singular and concrete, should not be put in the same class with those abstract and general ideas which are formed by the intellect from the materials got from sensation and reflection, and, we may add, from those furnished by the faculties of the mind in their exercise, such as those we have of the beautiful and the good. This confusion long lingered in the Scottish psychology from which it has scarcely yet been expelled.

Hutcheson represents complex (concrete would be the better phrase) ideas as having comprehension, and universal ideas as having extension; and announces the rule that extension and comprehension stand to each other in a reverse order. He distinguishes between a logical whole, which is a universal in respect of its species, which are spread out in division; and a metaphysical whole, which is the comprehension of a complex idea, and is declared by definition. He distinguishes between noetic and dianoetic judgment, in the former of which the two ideas are compared immediately (*proxime*), and in the latter by means of a third. The subject, predicate, and copula are said to be in the proposition either expressed or suppressed and involved. He does give the dictum of Aristotle as the regulating principle of reasoning, but derives all the force of syllogism from these three axioms, in which, we think, there is a very unsatisfactory vagueness in the phrase *agree*: " (1) Things which agree in one third agree with one another; (2) Things of which the one agrees and the other does not agree with one and the same third do not agree with one

another; (3) Things which agree in no third do not agree with each other; (4) Things which disagree in no third do not disagree among them selves. Hence are deduced the general rules of syllogisms." This "Compend" continued to be printed and used down to at least the close of the third quarter of the eighteenth century. One is inclined to think that these phrases and distinctions must have been introduced to the notice, and inscribed on the {73} memory, of William Hamilton during his collegiate life at Glasgow, and that they may have helped as they recurred, consciously or unconsciously, to suggest to him certain of the essential principles of the "New Analytic of Logical Forms."

He has a separate treatise on metaphysics ("Metaphysical Synopsis," 1742) which he divides into ontology, or the science of being, and pneumatology, or the science of spirit (divine and human). " It appears from his treatise on metaphysics," says his admiring biographer, " that he was well acquainted with the logomachies, meaningless questions, and trivial debates of the old scholastics, which had thrown a thick darkness on that part of philosophy: he has set that branch of knowledge in a clear light, and rendered it instructive and entertaining." The sneer at the scholastics is a symptom of the age. The alleged " meaningless questions " are still put, and must be put, by profound thinkers who would go down to the foundations of truth. Even Hutcheson was obliged to put them and to answer them. The answers which he gives, if not so profound in fact or in appearance as those given by the ancient Greek philosophers, by the scholastics, or by Descartes and Leibnitz, are always clear and sensible, and often just and satisfactory. He discusses, and this by no means in a superficial manner, topics which the Scottish metaphysicians between him and Hamilton carefully avoided. His scholastic training at Killyleagh, and the spirit of the older teaching, had still a hold upon him for good.

He treats of being, declaring it to be undefinable, and showing that it involves existence and essence, and that potency and action are the principles of being. He refers the conviction of our identity of being to consciousness. As to the much agitated question of the principle of individuation he comes to the sound conclusion that it is to be ascribed to the nature of the thing existing.

He discusses the question whether metaphysical axioms are innate. He denies that they are innate in the sense of their being known or observed by the mind from its birth, and affirms that in their general form they are not reached till after many comparisons of singular ideas. He shows that the mind assents to them in their singular form, even when a sensible object is presented. He stands up for axioms, self-evident and immutable, {74} -- with him, as with Locke, self-evidence being their prominent feature and their mark but he also declares them to be eternal and unchangeable, -- the mind perceiving at once the agreement or disagreement of the subject or predicate. He denies that there is any principle entitled to be regarded as the first of all, and maintains that it is vain to seek any other criterion of truth than the faculty of reason itself, and the native power of the mind. These views are surely more profound than those of Locke, less extravagant than those of Descartes, Leibnitz, or Wolf (he refers to Wolf). They do not exhaust the subject; in particular, while he says truly (with Aristotle) that the singulars and the less general are first known, he does not enter on the question, which neither the Scottish nor any other metaphysicians have yet settled, of the relation of self-evident truths in their singular to their generalized form.

In regard to space and time, he avoids the extreme positions both of Clarke, who represents them as modes of the divine being, and of Leibnitz, who describes them as mere relations perceived by the mind. He represents them as things or realities, and declares modestly and truly that we are ignorant of the relation in which they stand towards the divine nature. These judicious views were

followed by the Scottish metaphysicians generally down to the time of Hamilton.

This leads him into the investigation of the infinite. He regards the following propositions as probable: that it is scarcely possible that there should be a number of infinite things of the same kind , that the infinite, because it is infinite, cannot be greater; that infinites, so far as infinites, cannot be multiplied; nor can have any finite relation (*rationem*) to finite parts, although things by one reason infinite and by another finite may be divided and multiplied, if only there are other things of the same description. But after enunciating these bold propositions he cautiously adds that these questions may well be held to surpass human capacity.

He declares that, properly speaking, there is only one sort of cause, the efficient. He says that in the impulse and motion of bodies, and in the effort to change the idea in our minds, and to produce motions in our bodily members, we not only see change, but perceive some energy or efficacy. This view is not thoroughly carried out; it certainly is the truth so far as {75} it goes. He cautions us, in the very spirit of Reid, against dogmatizing too minutely as to the power of the mind over the body.

Substance is that which remains when the affections change. He agrees with Locke that the nature of substance is unknown, except that we have an obscure idea of something as the substratum of qualities. His views on this whole subject are meagre and unsatisfactory.

Still it is in the discussion of these questions that he passes beyond Shaftesbury, and shows the clearness, the judiciousness, and the independence of his thinking. I am not sure whether these metaphysical topics have been discussed in a profounder manner by any thinker of the Scottish school except Sir W. Hamilton; and he has not shown the same amount of speculative caution and good sense as Hutcheson.

But Hutcheson dwells far more on the motive and moral parts of man's nature than on logical and metaphysical subjects. We have seen that he brings in many other senses besides the external ones. He defines sense, " every determination of our minds to receive ideas independently on our will, and to have perceptions of pleasure and pain." The following is his classification of them: " (1) In the first class are the external senses, universally known. (2) In the second, the pleasant perceptions arising from regular harmonious uniform objects, as also from grandeur and novelty. These we may call, after Mr. Addison, the `pleasures of the imagination,' or we may call the power of receiving them an internal sense. Whoever dislikes this name may substitute another. (3) The next class of perceptions we may call a public sense; viz., our determination to be pleased with the happiness of others, and to be uneasy at their misery. This is found in some degree in all men, and was sometimes called [Greek term], or *sensus commnunis*, by the ancients; this inward pain or compassion cannot be called a sensation of sight. It solely arises from an opinion of misery felt by another, and not immediately from a visible form. The same form presented to the eye by the exactest painting, or the action of a player, gives no pain to those who remember that' there is no misery felt. When men by imagination conceive real pain felt by an actor, without recollecting that it is merely {76} feigned, or when they think of the real story represented, then, as there is a confused opinion of real misery, there is also pain in compassion. (4) The fourth class we may call the moral sense, by which we perceive virtue or vice in ourselves or others. This is plainly distinct from the former class of perceptions, since many are strongly affected with the fortunes of others who seldom reflect upon virtue or vice in themselves or others as an object; as we may find in natural affection, compassion, friendship, or even general benevolence to mankind, which connect our happiness or pleasure with that of others, even when we are not reflecting upon our own temper, nor delighted with the perception of our own virtue. (5) The fifth class is a sense of honor

which makes the approbation or gratitude of others, for any good actions we have done, the necessary occasion of pleasure, and then dislike, condemnation, or resentment of injuries done by us, the occasion of that uneasy sensation called shame, even when we fear no further evil from them." He adds that this enumeration may not be sufficient, and says that "there may be others, such as some ideas of decency, dignity, suitableness to human nature in certain actions and circumstances."

He then shows that the objects gratifying these senses call forth desires, which fall into five corresponding classes, those of the bodily senses, of the imagination or internal sense, of public happiness, of virtue, and honor. We are yet (so I am inclined to think) without a thoroughly exhaustive classification of the natural appetencies which lead to emotion, and desire, and action. That of Hutcheson is one of the best which we yet have, and should be looked to by those who would draw out a scheme of the categories of man's motive principles. I am disposed to think, however, that the sense of honor may be resolved into the moral sense combined with some other principles. (" Moral Philosophy," Book I.)

He shows how secondary grow upon these original desires. "Since we are capable of reflection, memory, observation, and reasoning about the distant tendencies of objects and actions, and not confined to things present, there must arise, in consequence of our *original desires, secondary desires* of every thing imagined useful to gratify any of the primary desires, and that {77} with strength proportioned to the several original desires and the imagined usefulness or necessity of the advantageous object. Thus, as soon as we come to apprehend the use Of wealth or power to gratify any of our original desires we must also desire them. Hence arises the universality of these desires of wealth and power, since they are the means of gratifying all other desires." Mackintosh says, " He seems to have been the first who entertained just nations of the formation of the secondary desires which had been overlooked by Butler." ("Passions," Sect. I. Mackintosh's " Diss.," Sect. V.)

He also shows how the association of ideas, which he characterizes as the "disposition in our nature to associate any ideas together for the future which once presented themselves jointly," has an influence upon our desires, primary and secondary, and specially on our sense of beauty. " Some objects which, of themselves, are indifferent to any sense, yet by reason of some additional grateful idea may become very desirable, or by like addition of an ungrateful idea ma raise the strongest aversion. When any circumstance, dress, state, posture, is constituted as a mark of infamy, it may become, in like manner, the object of aversion, though in itself most inoffensive to our senses. If a certain way of living, of receiving company, of showing courtesy, is once received among those who are honored, they who cannot bear the expense of all this may be made uneasy at their condition, though much freer from trouble than that of higher stations. Thus dress, retinue, equipage, furniture, behavior, and diversions, are made matters of considerable importance by additional ideas." , The beauty of trees, their cool shades and their aptness to conceal from observation, have made groves and woods the usual retreat to those who love solitude, especially to the religious, the pensive, the melancholy, and the amorous. And do not we find that we have so joined the ideas of these dispositions of mind with those external objects, that they always recur to us along with them." He thus started those views regarding the influence of association of ideas on our perceptions of beauty and moral good which were prosecuted by Turnbull, Beattie, and others, till they culminated in the ingenious but extravagant theories of Alison and Jeffrey in regard to the beautiful, and of Adam Smith and Mackintosh as to virtue. Hutcheson certainly has not developed the full {78} influence of association of ideas, but the account which he gives is just, so far as it

goes.[18]

He dwells at great length on the sense of beauty. The feeling is raised at once on the perception of certain objects. He does not stand up for beauty supposed to be in the nature of things without relation to any mind perceiving it. On the contrary, all beauty implies the perception of some mind. Still there may be a distinction drawn between original or absolute beauty on the one hand, and relative or comparative beauty on the other. By the former he understands the beauty which we perceive in objects without comparison with any thing external, such as that observed in the works of nature, artificial forms, figures, theorems; by the latter, the beauty founded on uniformity, or a kind of unity between the original and the copy. In determining what the beautiful is, he propounds the theory that it is a compound ratio of uniformity and variety, so that where the uniformity of bodies is equal, the beauty is as the variety; and where the variety is equal, the beauty is as the uniformity. He seeks to establish this view by examples, dwelling on beautiful objects in nature and art, showing how there is in all of them uniformity or unity, proportion or harmony. This doctrine may not be the full theory of beauty; but there must surely be some truth in it; for in some modification or other it has cast up among profound thinkers in all ages, from Plato and Augustine in ancient times, to Cousin, Macvicar, and Ruskin in our day.

He stands up resolutely for the existence of disinterested and social affections. He earnestly opposes those who, like the Cyrenaics, and probably the Epicureans, would make pleasure the end of existence, and who would make us desire the good of others or of societies merely as the means of our own safety and prosperity, or as the means of some subtler {79} pleasures of our own by sympathy with others in their happiness; or who would make our end to be the pleasure we enjoy in being honored, or some reward we expect for our services, and these either from God or man. He opposes also that more refined system which makes our aim the joys proceeding from generous motions and moral approbation. He shows, with great acuteness, that in all our desires, whether benevolent or selfish, there is some motive, some end intended distinct from the joy of success, or the removal of the pain of desire; and that there is first the motive operating, and then the joy or pain following, according as the motive is gratified or thwarted. He proves that men have affections, such as the love of offspring and of relatives, which fit them for a state of society; he takes pains to show that in this respect he differs from Puffendorf, who constructs his theory of society on the principle that self-love is the spring of all our actions; and he offers a most determined opposition to Hobbes when he makes the natural state of man to be one of war.

A considerable portion of all his works is occupied in demonstrating that man is possessed of a moral sense. In his "Inquiry," published before Butler's "Sermons on Human Nature," he declares, " that from the very frame of our nature we are determined to perceive pleasure in the practice of virtue, and to approve of it when practised by ourselves or others." He declares that the vast diversity of moral principles in various ages and nations " is indeed a good argument against innate ideas or principles, but will not evidence mankind to be void of a moral sense to perceive virtue or vice in actions." He ever kindles into a gentle warmth when he speaks of the joys derived from this sense, which he represents as purer and more elevated than those which can be had from any other source. The conscience, though often unable to govern our inferior nature, is yet in its own nature born for government; it is the ruling principle ([Greek term]) to which all things had been subjected in the entire (*integro*) state of our nature, and to which they ought to be subjected. His views on the subject of the supremacy of conscience are not so thoroughly wrought out as those of Butler; but they are explicitly stated, and become more decisive in his later works.

But what is the quality in actions looked at, appreciated, and {80} approved by the moral sense? To this question Hutcheson gives, if not a satisfactory, a very decisive reply. He represents this quality as good-will or benevolence. " All those kind affections which incline us to make others happy, and all actions which flow from such affections, appear morally good, if while they are benevolent towards some persons they be not pernicious to others." Advancing, a step farther, he discovers that "the several affections which are approved, though in very different degrees, yet all agree in one general character of tendency to the happiness of others," and the most perfectly virtuous actions are such " as appear to have the most unlimited tendency to the greatest and most extensive happiness of all the rational agents to whom our influence can reach." He is evidently inclined to reckon the moral sense as planted in our nature to lead us to commend at once those actions which tend towards the general happiness. His theory of virtue thus comes to be an exalted kind of eudaimonism, with God giving us a moral sense to approve of the promotion of happiness without our discovering the consequences of actions. Hume required only to leave out the divine sanction (he retained some sort of moral sense) in order to reach his theory of virtue consisting in the useful and agreeable. Hutcheson opposes very resolutely all those moralists who seek to give morality a deeper foundation in the nature of things. The function of reason in morals is simply to show what external actions are laudable or censurable, according as they evidence good or evil affections of soul.[19]

Proceeding on these principles, derived mainly from Shaftesbury, but more systematically expounded, he builds up a system of moral philosophy. He gives a division of the virtues, and treats of the duties we owe toward God, toward mankind, and toward ourselves. In proving the existence of God, he appeals to the structure of the world. He reaches the divine perfections by a set of metaphysical principles surreptitiously introduced, and scarcely consistent with his philosophy. {81} He answers the objections derived from the existence of evil in a commonplace way, by showing how particular evils are necessary to superior good. He seeks to establish the immortality of the soul by an appeal to the nature of the soul as being different from the body, and to the hopes of a future state.

He enters at great length into the discussion of the ages which preceded him, as to the law of nature. He shows that there are rights antecedent to the institution of civil government. He establishes the right of property, first, on the principle that " things fit for present use the first occupier should enjoy undisturbed; " and on the farther principle, that each has a right to the fruits of his own labor, and that it is the common interest of society, and tends towards the furtherance of industry, that mankind should be secured in their possessions.

He says that "civil power is most naturally founded by these three different acts of a whole people: (1) An agreement or contract of each one with all the rest, that they will unite into one society or body, to be governed in all their common interests by one council; (2) A decree or designation made by the whole people of the form or plan of power and of the persons to be intrusted with it; (3) A mutual agreement or contract between the governors thus constituted and the people, the former obliging themselves to a faithful administration of the powers vested in them for the common interest, and the latter obliging themselves to obedience. Though it is not probable that, in the constitution of the several states, men have generally taken these three regular steps; yet it is plain that, in every just constitution of power, there is some such transaction as implicitly contains the whole force of all the three." He argues that the people have a right of resistance, and of dethroning a prince who is grossly perfidious to his trust.

He thinks that the senate of the country should create a censorial power, " that by it the manners of the people may be regulated, and luxury, voluptuous debauchery, and other private vices prevented or made infamous." He holds that the " magistrate should provide proper instruction for all, especially for young minds, about the existence, goodness, and providence of God, and all the social duties of life and motives {82} to them." But he particularly maintains that " every rational creature has a right to judge for itself in these matters." While an earnest supporter of liberty of thought and action, he yet holds " as to those who support atheism, or deny a moral providence, or the obligation of the moral law, or social virtues, that the state may justly restrain them by force, as hurting,, it in its most important interests."

When Calamy heard of Hutcheson's call to Glasgow, he smiled, and said he was not for Scotland, and that he would be reckoned there as unorthodox as Simson. But Hutcheson lived an age later than Simson; he was much more prudent, and was personally liked; he was professor of philosophy and not of theology; and so he passed through life with very little public opposition. Still the stone which he had set a-moving could not go on without meeting with some little ruffling. About the beginning of the session 1737-38, a paper was printed and published anonymously by one who professed to have been lately in the college, charging Hutcheson with teaching dangerous views. I have not seen this attack; but the reply prepared by a body of his favorite students is preserved. There seems to be force in some of the objections taken; others entirely fail. It is objected to him that he taught that we could have the knowledge of moral good and evil, although we knew nothing of the being of a God; it is replied that Hutcheson's doctrine was that we might have knowledge of some virtues, though we had not known God, and that a notion of moral good must come prior to any notion of the will or law of God. It is objected that he taught that the tendency to promote the happiness of others is the standard of moral goodness; it is acknowledged in the answer that benevolent affections towards others are our primary notion of moral goodness, and the primary object of our approbation. It is objected that he taught that it is sometimes lawful to tell a lie; it is answered that Hutcheson's doctrine was very much against lying, but did imply that there might be cases in which lying was justifiable.

Throughout Scotland there was an impression among the scholars who had been trained in the previous generation that he was sensualizing and degrading the old philosophy. The friends of evangelical truth perceived that the young preachers {83} who admired him addressed them in a very different speech from that of their old divines and from that of the inspired writers. The description given of the new style of preaching by the clerical satirist Witherspoon, in his " Characteristics," was found to have point and edge: " It is quite necessary in a moderate man, because his moderation teaches him, to avoid all the high flights of evangelic enthusiasm and the mysteries of grace of which the common people are so fond. It may be observed, nay, it is observed, that all our stamp avoid the word grace as much as possible, and have agreed to substitute the moral virtues' in the room of the `graces of the Spirit.' Where an old. preacher would have said a great decree of sanctification, a man of moderation and politeness will say a high pitch of virtue." In the advice to a good preacher the following counsels are given: "(1) His subjects must be confined to the social duties. (2) He must recommend them only from rational considerations; viz., the beauty and comely proportions of virtue, and its advantages in the present life, without any regard to a future state of more extended self-interest. (3) His authorities must be drawn from heathen writers; none, or as few as possible, from Scripture. (4) He must be very unacceptable to the common people." " The scattering a few phrases in their sermons, as harmony, order, proportion, taste, sense of beauty, balance of the affections, will easily persuade the people that

they are learned; and this persuasion is to all intents and purposes the same thing as if it were true. It is one of those deceitful feelings which Mr. Hg in his essays has shown to be beautiful and useful." In illustrating the third counsel he says: " It is well known there are multitudes in our island who reckon Socrates and Plato to have been much greater men than any of the apostles, although (as the moderate preacher I mentioned lately told his hearers) the apostle Paul had a university education and was instructed in logic by Gamaliel. Therefore let religion be constantly and uniformly called virtue, and let the heathen philosophers be set up as great patterns and promoters of it. Upon this head most particularly recommend M. Antoninus by name, because an eminent person of the moderate character says his `Meditations' are the best book that ever was written for forming the heart." The effect of this accommodation of religion to the {84} world is graphically and truly described: "The necessity of such a conduct cannot be denied when it is considered what effect the length and frequency of public devotion have had in driving most of the fashionable gentry from our churches altogether." "Now the only way to regain them to the church is to accommodate the worship as much as may be to their taste." "I confess there has sometimes been an ugly objection thrown up against this part of my argument; viz., that this desertion of public worship by those in high life seems, in fact, to be contemporary with, and to increase in a pretty exact proportion to, the attempts that have been made and are made to suit it to their taste."

Hutcheson's works got fit audience in his own day, but did not continue to be much read after his death. In his mode and manner of writing he is evidently indebted to the wits of Queen Anne, such as Shaftesbury, Bolingbroke, Pope, and Swift, who were Frenchifying the English tongue, polishing away at once its roughness and its vigor, introducing the French clearness of expression, and, we may add, the French morals. Hutcheson has their clearness, but is without their liveliness and wit. His style is like a well-fenced, level country, in which we weary walking for any length of time; it is not relished by those who prefer elevations and depressions, and is disliked by those who have a passion for mountains and passes. He ever maintains a high moral tone but it is doubtful whether he has retained for morality a sufficiently deep foundation.

His philosophy is undoubtedly an advance upon that of Locke, and rises immeasurably above that of those professed followers of Locke in England and France, who in the days of Hutcheson were leaving out Locke's reflection, and deriving all man's ideas from sensation, and all his motives from pleasures and pains. His view of the moral faculty is correct so far as it goes. He represents it as natural to man, and in his very constitution and nature. There may even be a propriety in calling it a *sense* with the qualifying phrase *moral*, inasmuch as, like the senses, it is a source of knowledge, revealing to us certain qualities of voluntary acts or agents, and inasmuch as it has always feeling or sensibility attached to its exercises.

But, on the other hand, his view of the moral power falls greatly beneath that of the great English moralists of the previous century, and below that of the school of Clarke {85} in his own day. The word sense allies the conscience too much with the animal organism, and the whole account given of it separates it from the reason or higher intelligence. On this point he was met, immediately on the publication of his views, by Gilbert Burnet, who maintains that moral good and evil are discerned by reason; that there is first reason, or an internal sense of truth and falsehood, moral good and evil, right and wrong, which is accompanied by another succeeding internal sense of beauty and pleasure; and that reason is the judge of the goodness and badness of our affections and of the moral sense itself. Hutcheson does speak of the moral sense as being superior in its nature to the other senses, but he does not bring out so prominently and decisively as Butler did its supremacy and its right to govern.

If his theory of the moral power is superficial and defective, his account of that to which the conscience looks is positively erroneous. He represents virtue as consisting in benevolence, by which he means good-will. This view cannot be made to embrace love to God, except by stretching it so wide as to make it another doctrine altogether; for surely it is not as a mere exercise of good-will that to love God can be described as excellent. His theory is especially faulty in that it overlooks justice, which has ever been regarded by our higher moralists as among the most essential of the virtues. Nor is it to be omitted that his moral system is self-righteous in its injunctions, and pagan in its spirit. No doubt he speaks everywhere with deep admiration of the morality of the New Testament; but the precepts which he inculcates, are derived fully as much from Antoninus and the Stoics as from the discourses of our Lord, and the epistles of the apostles; and we look in vain for a recommendation of such graces as repentance and humility, meekness and long-suffering.

By bringing down morality from the height at which the great ethical writers, of ancient and modern times, had placed it, he prepared the way for the system of Adam Smith, and even for that of Hume. Smith was a pupil of his own, and Hutcheson was brought into contact with Hume. Hume submitted to Hutcheson in manuscript the " Third Part of his Treatise of Human Nature," that on morals, before giving it {86} to the world. The remarks which Hutcheson offered have been lost, but we can gather what they were from the letter which Hume sent him on receiving them, and which has been preserved. Hutcheson most characteristically objects to Hume, that he had not expressed a sufficient warmth in the cause of virtue, and that he was defective in point of prudence. Was this all that the high moralist Hutcheson had to object to the founder of modern utilitarianism? On the publication of his " Institutes of Moral Philosophy," Hutcheson sends a copy of it to Hume, who remarks upon it, specially objecting to it as adopting Butler's opinion, that our moral sense has an authority distinct from its force and desirableness g, but confessing his delight " to see such just philosophy, and such instructive morals, to have once set their foot in the schools. I hope they will next get into the world, and then into the churches." Yes, this was what the rationalists wished in that day, and what they wish in ours, to get their views *into the churches*. Hutcheson, though disapproving of the philosophy of Hume, and refusing to support him as a candidate for the chair of moral philosophy in Edinburgh, which he himself declined, had not retained sufficiently deep principles to enable him successfully to resist the great sceptic who had now appeared. Error has been committed, God's law has been lowered, and the avenger has come.

The Scottish Philosophy

James McCosh

1875

VIII. -- RELIGIOUS CONFLICTS. -- RALPH ERSKINE.

WE are now in the heart of the Scottish conflicts of the century. It is the crisis of the contest between Cavalier and Whig. On one point the philosophers and the evangelicals agree: they are defenders of the House of Hanover and opponents of the Pretender and the Stuarts, of whom they could not expect that they would be supporters of culture on the one hand, or of Protestantism on the other. The last formidable contest between Jacobite and Whig, was decided in behalf of the latter in 1746, at Culloden; and henceforth the former. is sinking into a state of complaining and garrulous, though often lively, old age. The religious conflicts are deeper, and continue for a longer period. From the time of Hutcheson, there is a felt and known feud, not always avowed, between the new philosophy and the old theology. It would have been greatly for the benefit of both, had there been one to reconcile and unite them. In the absence of such, each ran its own {87} course and did its own work, being good so far as it went, and evil only in its narrowness and exclusiveness, in what it overlooked or denied. The philosophers were laudably engaged when they were unfolding man's intellectual, esthetic, and moral nature; but they missed the deepest properties of human nature, when, in the fear of the ghosts of fanaticism, they took no notice of man's feelings of want, his sense of sin, and his longing after God and immortality; and the views of theologians would have been more just and profound, had they observed -- always in the inductive manner of the Scottish school -- those nascent ideas of good and evil and infinity which are at the basis of all religious knowledge and belief. The evangelical preachers were only faithful to their great Master when they declined to allow the doctrines of grace to sink out of sight; but they erred so far as they opposed the refinement and liberal sentiments which the moral philosophers were introducing, and showed that they were incapable of fully appreciating the apostolic command, "Whatsoever things are true, whatsoever things are honest, whatsoever things are just, whatsoever things are pure, whatsoever things are lovely, whatsoever things are of good report, if there be any virtue, and if there be any praise, think on these things." Pity it is that it should be so, but it is only by vibrations that the world moves on, only by breezes that its atmosphere is kept pure; and when the church errs by cowardice, it has to be rebuked by the unbelieving as -- an old Covenanter might have said -- the father of the faithful was rebuked by a pagan Egyptian. It was only in a later age, and mainly through the influence of Chalmers, that the church was prepared heartily to accept what was true in the Scottish philosophy, and to acknowledge its compatibility with the doctrine of salvation by grace.

Three distinct religious parties are being formed in Scotland, not including the covenanting "remnant," who never submitted to the Revolution settlement, and whose vocation was on the mountains, rather than the colleges of their country. First, in the Church of Scotland there is the "Moderate" type of minister crystallized by coldness out of the floating elements. He is or be affects to be elegant and tolerant, and he is terribly afraid of a zealous religious life. He wishes to produce among the people a morality without religion, or at least without any of the peculiar dogmas of Christianity. As yet he himself is a moral man, and the people are moral, for they believe in the old theology; in the next age both pastors and people, retaining little faith, become considerably immoral, showing that, if we would have the fruit good, we must make the tree good. This party, preaching moral sermons without doctrine, is the genuine product of the Scottish philosophy in the Church of Scotland.

Secondly, the Evangelical party, called by their opponents `zealots' and `highflyers,' were placed in an ambiguous position and shorn of much of their strength since the enforcement of the law of patronage. They are fast becoming a minority, and a small minority, in the church; and they have to submit to much that they abhor, as, for example, to the settlement of pastors contrary to the will of the people. But they labor earnestly to keep alive the fire all through the dark and wild night; they cherish fellowship with other evangelical churches, and anticipate the missionary spirit of a later {88} age by countenancing the " Society for the Propagation of Christian Knowledge." They come into collision with the philosophic moralists by maintaining so resolutely the doctrines of grace; and they carry their antagonism to the " legal " system to the very verge of Antinomianism, as shown in their favor for the "Marrow of Divinity," this by a reaction prompting the moral divines to preach a morality without an atonement for immorality.

Thirdly, beyond the Established Church, the Seceding body, encompassed with hardships as fierce as the storms, but breathing a spirit as free as the air of their country, are rallying around them the old-fashioned and more determined religious life of Scotland. At this stage of its history it serves itself heir to the Covenants of the previous century, blames the Church of Scotland for being too indulgent, is intolerant of toleration, and has little sympathy with other churches. This body is beneath the notice of the philosophers; and in return it shows its utter distrust of them by declining to allow its students to attend the classes of moral philosophy, and appointing a professor of its own to give instruction in that branch, on which, as on other high departments of learning, it continued to set a high value. The event of that period which agitated lowland Scotland more than even the inroad of the Pretender was the preaching of Whitefield, which moved the common people as the winds do the trees of the forest. The moderate party affected to despise and actually hated the preacher and his doctrine. The evangelicals in the Established Church rejoiced in his labors and their fruits. The seceders might have triumphed in his success; but they expected him to identify himself with their peculiar ecclesiastical constitution, and stand by them in the fight for the old cause of the Covenant. Upon Whitefield declining to do this, they became jealous of his influence, and were in doubts about the sound character of the revivals which he was the means of awakening. Out of this arose a very curious controversy, forgotten by all but a few antiquarians, but not unworthy of being noticed.

Mr. Robe, belonging to the evangelical party in the Church of Scotland, and a promoter of revivals and of the lively feeling manifested in them, declared that "our senses and imagination are greatly helpful to bring us to the knowledge of the divine nature and perfections; " and in defending this he asked: " Can you or any man else think upon Christ really as he is, God-man, without an imaginary idea of it?" To this Ralph Erskine, the seceder, replies in a treatise Of 372 closely

printed pages, entitled " Faith no Fancy; or a Treatise of Mental Images, discovering the Vain Philosophy and Vile Divinity of a late Pamphlet entitled `Mr. Robe's Fourth Letter to Mr. Fisher,' and showing that an Imaginary Idea of Christ as Man (when supposed to belong to Saving Faith, whether in its Act or Object) imports nothing but Ignorance, Atheism, Idolatry, great Falsehood, or gross Delusion " (1745). He says of Mr. Robe: " This way of speaking appears indeed new and strange divinity to me, and makes the object of faith truly a sensible object; not the object of faith, but of sense." This leads him to criticise various philosophies. He refers to Tertuilian (as quoted by Jerome), who in regard to Platonic ideas said, " Haereticorum patriarchae philosophi." He shows him that the learned De Vries, Mastricht, and other eminent doctors {89} and divines abroad, had noticed how the ideal doctrine of Cartesius and his followers had led to imagery and idolatry. He also criticises Locke with considerable skill. "There seems nothing more common in the experience of mankind than that a man who hath the greatest stock of habitual knowledge and understanding relating to many truths, yet while his body sleeps, or his mind is in a muse about other things, lie perceives none of theme truths." So "I see no greater absurdity in saying one may leave a stock of seminal or habitual knowledge, though lie leave no actual knowledge, than to say one may have a stock of senses, though be hath no actual sensation, or consciousness of the acts or exercise of any of his senses, as a child not born or a man in a deep sleep; or a natural store of affections subjectively in him, and yet affected with nothing till occasions and objects appear. One may have a good pair of eyes, and yet see nothing till light be given and objects be presented. Nor is it an improper way of speaking to say a man hath not his eyes or sight, though he be not actually seeing. And as little is it improper to say a man hath understanding and knowledge, though he be not actually knowing or perceiving the truths he has the impress of in his understanding." This is a wonderfully clear statement of the distinctions between the seminal capacity and the actual ideas, between a laid-up stock and occasions, by which philosophers have sought to overthrow the theory of Locke. In regard to the special question discussed, Mr. Robe had quoted the received rule, "*Oportet intelligentem phantasmata speculari*." Erskine quotes against him Hieroboord, " Mens non indiget semper phantasmata ad suas perceptiones." "The object of that idea is only corporeal things as corporeal; but the object of rational knowledge is not only corporeal things, but spiritual and corporeal things, not as corporeal, but as intelligible." " It is reason, and not sense, that is the only help to attain the natural knowledge of God and his perfections." Above reason he places faith. " True faith differs as much from, and is as far above, mere intellectual ideas as intellectual ideas are above corporeal and imaginary ideas; yea, much farther than human reason is above sense; even as far as what is above human and supernatural, is above merely natural." It is evident that there are curious questions started, though not precisely settled, as to the place which the phantasm has in thought, and the imagination in religion. We feel that we are in the society of men of reflection and of reading. The evangelical and the seceding ministers of these days are quite as erudite as the academic men who despised them, and are holding firmly by old truths which the new philosophy is overlooking.

IX.-- ARCHIBALD CAMPBELL.

HE was a pupil of Professor Simson's, in Glasgow, and became minister of Tarbert in Stirlingshire. I have been able to collect few notices of him. He is worthy of being mentioned, as having had played upon him one of the basest tricks mentioned in literary history. He wrote a treatise on {90} "Moral Virtue," and sent it up to London to his friend, Alexander Innes, D.D., assistant at St. Margaret's, Westminster, to have it published; and Innes published it in his own name, with the date, Tothill Fields, Jan. 20, 1727-28. In 1730, Campbell went to London and exposed Innes's imposture. It seems that the Lord Chancellor, believing that Innes was the author of the work, presented him to a living. The Chancellor, being convinced of the deceit, sought to male amends by offering a living to Campbell, who declined the offer, saying that he preferred his own country; and he becomes professor of ecclesiastical history in St. Andrews. In 1733, he published the work in his own name, dating it St. Andrews, and disowning the " Prefatory Introduction " and " some little marginal notes of Innes." "An Inquiry into the Original of Moral Virtue, wherein is shown, against the Author of the Fable of the Bees, that Virtue is founded in the Nature of Things, is unalterable and eternal, and the great Means of Private and Public Happiness, with some Reflections on a late Book entitled `An Inquiry into the Original of our Ideas of Beauty and Virtue.' " Hutcheson, whom he thus assailed, spoke of him as no better than a disciple of Epicurus. His system is the boldest form of self-love. " Human nature is originally formed to pleasure and pain." " There is, indeed, a. distinction of goodness into natural and moral, but the latter as well as the former lies wholly in pleasure." 'God and all mankind are governed by one common principle, viz., self-love." "They can favor or esteem no other beings but as they gratify this principle." " The affections and actions that correspond to the self-love of our own species are likewise agreeable to the self-love of the Deity." " From self-love we desire the love and esteem of other intelligent beings." There is a passage in which there is an anticipation of Smith's theory of sympathy: " Whatever tenderness we conceive in favor of other people, it comes from putting ourselves in their circumstances, and must therefore be resolved into self-love." He also wrote a treatise on the " Necessity of Revelation," 1739; and another, " Oratio de Vanitate Luminis Naturae." He thinks it impossible that man kind, left to themselves, should `discover' the great truths and articles of natural religion, or should be capable of giving a system to natural religion." He died in April, 1756. A posthumous work, " The Authenticity of the Gospel History," was published 1759. He was opposed by [Alexander Moncrieff].

X.-- ALEXANDER MONCRIEFF.[20]

ALEXANDER MONCRIEFF Of Culfergie in the parish of Abernethy was educated at the grammar school of Perth and St. Andrews University, and became minister of his native parish. He was favorable to the Marrow school of divinity, and took part with the Erskines in defending the popular rights and in seceding from the Church of Scotland, being one of the four fathers of the secession. In 1724, he was made their professor of divinity. He {91} died in 1761. He wrote "An Inquiry into the Principle, Rule, and End of Moral Actions, wherein the Scheme of Selfish Love laid down by Mr. Archibald Campbell . . . is examined, and the received Doctrine vindicated." To quote the summary supplied by his biographers, he establishes the following propositions: " (1) To show that self-love is not, or ought not to be, the leading principle of moral virtue; (2) That self-interest or pleasure is not the only standard by which we can and should judge of the virtue of our own and others' actions, or that actions are not to be called virtuous on account of their correspondency to self-interest; (3) That self-love, as it exerts itself in the desire of universal, unlimited esteem, ought not to be the great remaining motive to virtuous actions," &c.

XI.-- RISE OF THE ABERDEEN BRANCH.

THE north-east of Scotland, -- embracing Aberdeen, Banff, Murray, Mearns, and a large portion of Angus, -- though now very much amalgamated with the rest of Scotland, had a character of its own in the seventeenth century. The people had a large Scandinavian element in their composition, had a shrill intonation, and a marked idiom, and a harder aspect (though probably with quite as much feeling within) than the people of the south and west. When Samuel Johnson lumbered through the region in 1773, and visited Lord Monboddo, he found it miserably bare of trees; but, had he travelled a century or two earlier, he would have had to pass through wide-spread forests. These were cut down in the seventeenth century; and in the stead of the deer and wild animals a more industrious people substituted sheep and cattle, ranging over high mountains and large undulating plains, on which you would have seen patches of oats or bear here and there around the clay or turf dwellings of the tenants, but few fences or enclosures of any kind, except in the immediate neighborhood of the proprietors, whose castles and gardens, on the French model, relieved the wildness of the scene. On to the eighteenth century the rural population consisted of landlords, with rather small farmers absolutely dependent on them, and who paid their rent in the service, on certain occasions, of men and horses, and in such articles as oats, bear, mutton, salmon, geese, poultry, and peats. In these regions the peasantry had not been taught to think and act for themselves, as they had been in the south-west by the ploughing {92} up of the soil effected by the great covenanting movement. But in some of the towns, particularly in Aberdeen, which was looked up to as a capital by a considerably wide district, there was not a little refinement, which spread its influence over the landlords, the ministers of religion, and the other professional men: in particular, there had been in the city named a gifted painter, Jameson, a disciple of Rubens; and a very superior printer, Raban, who put in type the works of the Aberdeen doctors. The two universities, King's and Marischial's, trained and sent forth a large body of educated men, some of whom found their proper field on the Continent; while the great body of them remaining at home, were the special instruments-as teachers, clergymen, doctors, lawyers, or country gentlemen-of spreading a civilizing influence in these regions. For ten years after the Restoration, seventy students entered annually at King's, and a considerable number, though not so large, at Marischal some of these rose to eminence, and all of them helped to create a taste for learning and an appreciation for it, on the southern slope of the Grampians, and in the wide region lying north of that range of mountains, which was never crossed by the Roman legions, but was now conquered by the Roman literature.

The Calvinistic and covenanting principles which had determined the Scottish character in the

south and west, and so far north as Fife, Perth, and some parts of Angus, had not generally permeated the region beyond. No doubt, the common people in the northern counties gladly listened to the evangelical preachers from the west, when they had the opportunity; and some of the covenanting ministers, banished in the times of persecution from their own people in the south, gathered around them in the places of their exile -- as Samuel Rutherford in Aberdeen, David Dickson in Turriff -- bodies of devoted adherents attached to the Presbyterian preaching and organization. Still these were as yet merely fermenting, but leavening, centres in the midst of influences which were resisting their extension. In the wide country held by the Gordon family, the Roman Catholic religion still held its sway. In the other parts, the landlords, the college regents, and the clergy were mostly Cavalier in politics and High Church in religion; and the mass of the people bad not learned to claim the prerogative {93} of thinking and acting for themselves. When a deputation from the General Assembly of the Presbyterian Church of Scotland-consisting of Alexander Henderson, Samuel Rutherford, and Andrew Cant-went north to Aberdeen to proclaim the Covenant in 1638, they were met by "Replies and Duplies" on the part of the Aberdeen doctors, and the landlords discouraged their tenantry from following the new zeal imported from the south. The divines of Aberdeen, during that century, such as Baron and John Forbes (author of "Irenicum"), were adherents of Episcopacy; their studies were in the later fathers of the church, and their sympathies with the Laudean divines of England; and like them they wrote against Popery on the one hand, and Puritanism on the other. It was years after the Revolution before the Presbyterian Church could put its legal rights in execution in the north-east of Scotland. Almost all the old Presbyterian ministers had disappeared; and, in 1694, the Synod of Aberdeen consisted of six clerical members, most of them brought from the south. It was not till 1703 that John Willison was settled as first Presbyterian minister at Brechin in Angus; it was not till 1708 that he was in a position to dispense the sacrament of the Lord's Supper. When he intimated that he was to do so next Lord's day, Mr. Skinner, the Episcopalian minister who preached in the same church in the after part of the day, announced that he would dispense the communion on the same day in the afternoon to his supporters; and the ecclesiastical records report that 1500 communicated with Mr. Skinner. When Mr. Gray was appointed minister of Edzell, in the same district, the Presbytery had to conduct the services at his ordination in a neighboring parish; and they then passed into the parish to " lay hands on him " and return immediately; and, on the following sabbath when he rode to Edzell for the purpose of preaching, the people, hounded on by the landlords, took him off his horse, flung him into the West Water, and kept him there till he was nearly drowned, " to their eternal disgrace," as he causes it to be written in the parish records. During the Rebellion of 1715 the Presbyterian ministers were rabbled from their churches, which were occupied by the nonjuring clergy praying for the Pretender. A considerable body of the students in both the Aberdeen colleges sympathized {94} with the banished king; and, after the battle of Sheriffmuir, several of the professors had to retire in consequence of the part which they had taken against the government. It was not till after the suppression of the Rebellion of 1715,-indeed, not fully till after the crushing of the chieftain power after 1745,-that the north-east of Scotland became one with the south of Scotland in religion and in national feeling.

In the universities, both tinder Prelatic and Presbyterian domination, the philosophy taught had been to a great extent Aristotelian and scholastic. The university commissioners appointed, in 1643, a *cursus* for Aberdeen; and in it the student is required, after taking Greek the first year, to go on the second year to the dialectics of Ramus, to Aristotle's categories, interpretation, and prior analytics, and in the third year to the rest of logics and portions of the ethics of Aristotle, &c. In the

" Metaphysics " of Robert Baron, who lectured in Marischal College in the first half of the seventeenth century, he treats of being, unity, and goodness; enters fully into the controversy between the Thomists and Scotists; gives the divisions of *ens* and of cause, and treats of necessity and contingency, of sameness and diversity, of absolute and relative, of whole and parts. In the university library of Aberdeen we have theses occupying 121 pages by Andrew Cant, the younger, of date 1658; in these he shows that he knew the Copernican theory of the heavens and Harvey's discovery of the circulation of the blood: but the whole discussions are conducted in a formal manner; and he dwells fondly on the scholastic logic, in the treatment of which he shows some independence of thought. In 1710 there was published a work by Thomas Blackwell, who had come from Paisley, in 1700, to be minister at Aberdeen in the Presbyterian interest, and who was made professor in 1711, and principal in 1717: his work is entitled " Schema Sacrum, or a Sacred Scheme of Natural and Revealed Religion; " and in it the common orthodox theology is defended by the old distinctions, and there are no traces of a new spirit or a new school.

But, after the year 1715, Aberdeen was prepared for a new style of thought. The High Church theology was no longer encouraged, except among a scattered nonjuring clergy subjected to poverty and privation. The Calvinistic divinity had {95}never struck its roots deep into the soil; but the literature and physical science of England were known

to and relished by the educated classes, and there must be a fresh philosophy to meet the awakened intelligence and new tastes of the country. The first to gratify this feeling was a young graduate of Edinburgh, appointed as one of the rectors in Marischal by the Crown, which had seized the patronage of the college, vacated by the attainder of Earl Marischal, who had been out in the rebellion.

1875

XII. -- GEORGE TURNBULL.[21]

THE celebrated Hogarth, in his "Beer Street," has a graphic picture of a porter drinking barley wine, after depositing on the ground a load, directed to the trunk-maker, of five enormous folios; one of which has on the back, "Turnbull on Ancient Paintings." Turnbull was one of the most voluminous writers of his age. I have read many thousand pages written by him; but I fear the greater part of the copies of his works have gone to the destiny indicated by Hogarth. It is disappointing to find that this author, who was both an able and a graceful writer, has passed away from the public view so effectively that it is difficult now to procure materials for his biography, or even to get a sight of most of his works. It may be doubted whether any one, except the writer of this history, has been at pains to peruse his works as a whole, for the last hundred years. Dugald Stewart, so well informed on British philosophy, had only looked into one of his volumes; and Sir William Hamilton, in his multifarious researches among obscure writers, does not seem to have thought it worth his while making any inquiries about him. Yet it can be shown that he exercised a greater influence than all other masters and writers put together on his pupil Thomas Reid,-the true representative of the Scottish philosophy. He seems to have been the son of the Rev. George Turnbull (his mother's name was Elizabeth Glass), of whom we {96} can gather a few scattered notices: as that he was born about 1656; that he graduated in Edinburgh University in 1675; that he became minister of Alloa in 1689, when the Episcopal clergyman was ejected; that he was translated to Tyningham in 1699; that he was nominated but not carried as moderator of the General Assembly in 1711; that he preached before that body in 1713; that his name appears among the members of "The Society for Propagating Christian Knowledge," in 1720 and that he died in June, 1744, at the age of eighty-eight. His son was born in 1698 (he was baptized July 15) graduated in Edinburgh in April, 1721 and in November of the same year he was appointed, by a presentation from the Crown, regent of Marischal College; and is taken on trial in philosophy and the Greek Language, and declares his willingness to sign the Confession of Faith. He comes to have among his colleagues Thomas Blackwell, son of the principal, admitted regent in 1723, who did much to create a taste for Greek in the college, and who is still known to antiquarian scholars by his learned but uninteresting works, "Inquiry into the Life and Writings of Homer," "Letters concerning Mythology," and " Memoirs of the Court of Augustus." In Aberdeen at that time there was-as we have seen there was in Glasgow-- a principal's party and an opposition party; and there were disputes about the election of the rector. The majority of the masters, including Mr. Turnbull, in opposition to the principal, Blackwell the elder, wish the society to make up a list of persons recommended for the office of rector, to be submitted to the procurators chosen by the

students in their nations; and, upon the principal refusing, they elect a preses in his room, and choose a rector, who holds a court and summons the principal to appear before them; but they are stayed in their career by a suit from " the Lords of Council and Session." On April 14, 1726, he has carried a batch of thirty-nine students through a course of philosophy on to graduation; and the last name on the list is Thomas Reid. As having to preside on this occasion, he prepares a thesis, afterwards published, to be discussed by the candidates, -- "De Pulcherrima Mundi Materialis turn Rationalis Constitutione," -- in which the new physics are employed to furnish proofs of the existence of God, and in which he declares that natural science (physiology) is to be taught before moral philosophy, and inclines to censure Socrates because {97} he discouraged inquiries into the structure of nature. He also printed, when at Aberdeen, a " Thesis on the Connection of Natural and Moral Philosophy." In his lectures on pneumatology he delivered to his students those views which, after being rewritten, were given to the world in his treatise on moral philosophy. In his later writings he frequently quotes Hutcheson and Butler; but his own philosophic opinions seem to have been formed, and delivered in lectures, before either of these influential writers had published any of their works.

In 1726, he published "A Philosophical Inquiry concerning the Connection between the Doctrines and Miracles of Jesus Christ." In it he treats of subjects in which there is a revived interest and which are anxiously discussed in our day, and advances principles which would be favorably received by many in these times. He argues that the works of Jesus were natural proper samples of his doctrines. That he had abandoned the old theology of Scotland is evident, from his declaring that the Scripture way of talking about the Spirit of God and his operations means simply assistance to the virtuous. It is interesting to notice, that in this treatise he refers once and again to common-sense as settling certain moral questions; in this, as in other matters, anticipating and probably guiding Dr. Reid.

In the spring of 1727, Turnbull resigned his office in Marischal College; and for the next twelve years we have little record of him. There is reason to believe that he became a travelling tutor, -- it is said, to the family of the Wauchopes, of Niddry, near Edinburgh. It is certain that he must have travelled extensively on the Continent, and made himself conversant with the treasures of art in Italy. In 1732, he received the honorary degree of doctor of laws from the University of Edinburgh. He seems to have mingled in the literary circles of London,[22] and acquired friends among persons of eminence. During these years he prepared an immense store of literary works, which were issued in rapid succession, -- more rapidly, I suspect, than the public were prepared to receive them. In {98} October, 1739, he advertises, at four guineas, in sheets, his " Treatise on Ancient Painting;" in which he has observations on the rise, progress, and decline of that art among the Greeks and Romans, comments on the genius of Raphael, Michael Angelo, Nicholas Poussin, and others, and illustrates the work will) engravings of fifty pieces of ancient painting. It will be remembered that Shaftesbury had " Disquisitions on Taste;" and we shall see most of the Scottish metaphysicians speculate on taste and beauty. The work was not of such an original or daring character as to recommend it to the genius of Hogarth; yet it seems to have had a considerable roll of subscribers. " is style is pleasant, and the remarks judicious and highly appreciative of the classical painters. In February, 1740, there appeared his most important work, and the only one that continues to be read, "The Principles of Moral Philosophy." At the close he promises, as soon as his health admits, a work on " Christian Philosophy," which was actually published before the close of the year; and in it he treats of the Christian doctrines concerning God, providence, virtue, and a future state, and recommends the Word of God because it embraces and illustrates such

doctrines. He dates October, 1740, a preface and appendix to Heineccius's " Methodical System of Universal Law."[23] In 1742, he published " Observations upon Liberal Education; and in it he speaks as having long been engaged in the work of education. He subscribes himself as Chaplain to the Prince of Wales, and dedicates the treatise to the " Right Reverend Father in God," Thomas, Lord Bishop of Derry; in whose esteem, he says, " he had long had a share."[24] It appears that before {99}this time be had left the communion of the Presbyterian Church of Scotland, and entered into orders in the Episcopal Church of England, which was doubtless more congenial to his tastes. Through the bishop, to whom he dedicated his work, he was appointed Rector of Drumachose, in the diocese of Derry. I cannot find that he left any mark behind him in that parish: there is no remembrance of him in the popular tradition of the district, and no record of him in the diocese. In consequence of failing health, he went to the Continent, and died at the Hague, Jan. 31, 1748.[25]

Turnbull was the first metaphysician of the Scottish -- I believe of any -- school to announce unambiguously and categorically that we ought to proceed in the method of induction in investigating the human mind. He takes as the motto of his " Moral Philosophy " the passage from Newton about the method of natural philosophy being applicable to moral subjects, and the line of Pope, " Account for moral as for natural things." His enunciations on this subject are as clear and decided as those of Reid and Stewart in after ages. "If a fact be certain, there is no reasoning against it; but every reasoning, however specious it may be, -- or rather however subtle and confounding, -- if it be repugnant to fact, must be sophistical." It must have been from Turnbull that Reid learned, even as it was from Reid that Stewart learned, to appeal to common language as built on fact or universal feeling. "Language not being invented by philosophers, but contrived to express common sentiments or what every one perceives, we may be morally sure that where universally all languages make a distinction there is really in nature a difference." Reid only catches the spirit of his old master, who speaks of " philosophers who, seeking the knowledge of human nature not from experience, but from I know not what subtle theories of their own invention, depart from common language, and therefore are {100} not understood by others, and sadly perplex and involve them selves." In some respects, his exposition of the method is more comprehensive and correct (so I believe) than that given by Reid and Stewart; inasmuch as he avows distinctly that, having got facts and ideas from experience, we may reason deductively from them, in what Mr. J. S. Mill calls the deductive method, but which is in fact a joint inductive and deductive method. He sees clearly that in natural philosophy there is a mixture of experiments with reasonings from experiments; and he asserts that reasonings from experiments may have the same relation to moral philosophy that mathematical truths have to natural philosophy. " In both cases equally, as soon as certain powers or laws of nature are inferred from experience, we may consider them, reason about them, and compare them with other properties, powers, or laws." He instances among the moral ideas which we may compare, and from which we may draw deductions, those of intelligence, volition, affection, and habit. Moral philosophy is described by him as a mixed science of observations, and reasoning from principles known by experience to take place in or to belong, to human nature. In his preface to Heineccius, he says that the appended " discourse upon the nature and origin of laws is an attempt to introduce the experimental way of reasoning into morals, or to deduce human duties from internal principles and dispositions in the human mind." In following this method, he claims to be superior to Puffendorf, to Grotius, and the older jurists.

Proceeding in this method he discovers, both in matter and mind, an established order and excellent general laws, and on this subject quotes largely from his contemporaries Berkeley and

Pope. He constantly appeals to these laws as illustrating the divine wisdom; and to the excellence of laws as justifying the divine procedure, despite certain incidental acts which may flow from them. As inquirers discover these laws, science is advanced; and he dwells as fondly on the progressiveness of knowledge as Bacon had done and as Stewart has done.

In particular, he shows that if we look at human nature as a whole, and at its several parts, we shall find beneficent general laws. He discovers in our constitution means to moral ends, and the science of these means and ends is properly {101} called moral philosophy. He shows that by such a study we can discover what are natural laws; and that, in all well-regulated states, the sum and substance of what is called its civil laws are really laws of natural and universal obligation adding that "civil law adopts only those laws of nature on which the quiet of mankind entirely depends, and that there are other duties to which men must attend out of reverence to their Creator and sincere love to mankind, without regard to the fear of human penalties." He shows that mankind are not left indifferent to virtue and to beauty: "As we are capable of distinguishing truth from falsehood, so we are capable of distinguishing good and approvable actions, affections, and characters, from bad and disapprovable ones." He would call this capacity moral sense, moral taste, moral discernment, or moral conscience. Like Shaftesbury (" who must live forever in the esteem of all who delight in moral inquiries"), and Hutcheson, whom he often approvingly quotes, he represents the virtues as capable of being reduced into benevolence.

In unfolding the elements of human nature, he dwells with evident fondness on the "association of ideas." He does not seem to attempt an ultimate resolution of the laws; but he considers association as "a league or cohesion formed by frequent conjunction in the mind," and says that "any appearance immediately suggests its concomitants and consequents to us." He adds, that association is more easily engendered between ideas that have some affinity or likeness." It may be doubted whether we have a better account at this day of the law of association as a whole. In regard to what Brown calls " secondary laws," and Hamilton the " law of preference," he prescribes two rules from Cicero for helping the memory: one is to attend to the things we would wish to recall; and the other is to consider its analogies, relations, and oppositions to other objects which will thus call it up. He accounts (as Stewart does) by the association of ideas for the law of habit, which he represents as a " propension to do, and a facility and readiness in doing, what we have often done." He shows truly and ingeniously how association influences the senses, by connecting the qualities perceived by one sense with those perceived by the others (a subject much dwelt on in a later age {102} by Brown); and, in particular, how, according to the theory of Berkeley, it aids the eye in discovering distance, not itself an idea of sight. He shows how our ideas have other ideas so associated with them that they make one perception, and how difficult it is to separate ideas that have thus been associated, and to find out precisely and philosophically what is involved in any particular idea, and how apt we are in consequence to confound qualities that are different. He is particularly successful in showing that desires and volitions are prompted by associations. " Ideas, as often as they return, must excite certain affections; and the affections which lead to action must, as often as they are revived, dispose and excite to act, or, in other words, produce will to act." He remarks that " very few, if any, of the ideas which excite our warmest and keenest affections are quite free from associated parts." He insists that " various associations must produce various tempers and dispositions of mind; since every idea, as often as it is repeated, must move the affection it naturally tends to excite, and ideas with their correspondent affections often returning must naturally form inclinations, propensions, and tempers." He would account in this way for much of our feeling of beauty, and for propensity to imitate passing into custom. His

exposition of the association of ideas is more satisfactory and accurate than the one, so much commended, published by Hume at the same time; and is far more philosophical than that given by Reid, who, in this respect, fell behind his master. I jam acquainted with no exposition of this part of our constitution published prior to his time which seems to me so full and correct.

His ideas on education are liberal and advanced. He is opposed to corporal punishment, and declares that the grand aim of education should be to foster good habits. Giving a high place to the study of the mind, he maintains, as did all the great masters of the Aberdeen school who came after him, that mental science should not be taught to young men till their minds have been other-wise well furnished. He gives logic a somewhat large and wide field;, in this respect, too, like the Scottish metaphysicians who came after him. Its province is to " examine the power and faculties of our minds (favorite phrases of Reid's), their objects, and operations; to inquire {103} into the foundations, the causes of error, deceit, and false taste; and, for that effect, to compare the several arts and sciences with one another, and to observe how each of them may derive light and assistance from all the rest. Its business is to give a full view of the natural union, connection, and dependence of all the sciences." Like Reid, and Stewart after him, he sets a high value on the study of " the nature and degrees of moral, probable, or historical evidence," and complains that it is left out in the logical treatises. The teacher should aim to make his pupil look at things, instead of words. At the same time, he recommends the study of languages with the study of things employing language in an enlarged sense, as embracing the different methods of expressing, embellishing, or enforcing and recommending truth, such as oratory, poetry, design, sculpture, and painting. He complains that in education the arts of design are quite severed, not only from philosophy, but from classical studies. The object contemplated by him in his work on " Painting " was to bring these various branches into union: he thinks that paintings may teach moral philosophy. The essential elements of painting are represented by him as being truth, beauty, unity, greatness, and grace, in composition. He dwells fondly on the analogy between the sense of beauty and moral sense; and on the inseparable connection between beauty and truth. His works on " education " and on the fine arts are clear and judicious, written in a pleasant and equable, but at the same time a commonplace style; and they seem never to have attracted the attention which they deserved, and which would have been freely given to works of greater pretension, eccentricity, or extravagance.

But, after all, we are most interested in noticing the points in which Turnbull seems to have influenced Reid. We have already had some of these before us. We have seen that Turnbull announces as clearly as Reid that the human mind is to be studied by careful observation. Both are averse to abstruse scholastic distinctions and recondite ratiocinations on moral subjects. Turnbull ever appeals, as Reid did after him, to consciousness as the instrument of observation. Both are fond of designating mental attributes by the terms ,powers " and "faculties." Both would give a wide, and I may add a loose, field to logic, and include in it the inquiry into the nature of probable evidence. {104} In proceeding in the way of observation, both discover natural laws or principles, and both call them by the name of " common-sense." " Common-sense is certainly sufficient to teach those who think of the matter with tolerable seriousness and attention, all the duties and offices of human life; all our obligations to God and our fellow-creatures; all that is morally fit and binding. And there is no need of words to prove that to be morally fit and obligatory, which common-sense and reason clearly show to be so." Reid holds that all active power implies mind. This was the expressed doctrine of Turnbull before him. " It is, therefore, will alone that produces both power and productive energy." " To speak of any other activity and power, is to Speak without any meaning at all; because experience, the only source of all our ideas (and of the

materials of our knowledge), does not lead us to any other conception or idea of power." Nor should it be omitted that both -- in this respect, however, like all the other Scotch metaphysicians ever speak with profound reverence of Scripture; ever, however, dwelling most fondly on those doctrines of the word which are also truths of natural religion; such as the existence of God, the obligations of morality, and the immortality of the soul.

I have been at pains to trace these agreements, not with the view of depreciating the originality and still less the independence of Reid, who may have had some of these views suggested to him by his teacher, but who may have afterwards found them in other writers, and who no doubt thought them all for himself, and adopted them because they seemed to him to be sound.[26] We have seen that in one or two points, Reid fell behind his master, who had clearer apprehensions than his pupil of mingling deductive with inductive observation, and of the laws of the association of ideas. But in other and more important philosophic doctrines, Reid passed far beyond his teacher. Reid claims to be original in rejecting the ideal theory of sense perception; which had been the received one for two thousand years, which had been adopted by Locke, and pursued to its logical consequences by Berkeley. But Turn bull evidently adheres to the old view. " Properly speaking, what we call matter and space are but certain orders of sensible {105} ideas produced in us, according to established rules of nature, by some external cause; for when we speak of material effects and of space, we only mean, and can indeed only mean, certain sensible perceptions excited in our mind according to a certain order, which are experienced to be absolutely inert and passive, and to have no productive force." He speaks of the "external material world " as unperceived by us, and in itself absolutely unperceivable, as all philosophers acknowledged When, in speaking of the material world, he says it may be called the "external cause or occasion of those sensible ideas, and their connections, which make to each of us what we call the sensible world," we see that this is the doctrine which Reid set aside g, and yet we may notice that the phrase " occasion " is used by Turnbull, as by Reid, to designate the relation of the external action to the internal perception. In another point, Reid made a more important advance upon Turnbull. Living at a later age, Reid had to meet the objections of the great modern revolutionist, and had in consequence to dive down into profounder depths of the human constitution. The scepticism of Hume brought out to view the superficialities of the philosophy of Shaftesbury, partly by following its principles to their legitimate consequences, but mainly by making all men feel that it is nothing wherewith to meet the assaults of the new and formidable enemy. Shaftesbury, Hutcheson, and Turnbull had all appealed to common-sense; but Reid behoved to take a deeper and more searching view of the principles which constitute common-sense, in order to meet the exigencies of the new era.

Turnbull's works had no great circulation in their own day, and they speedily disappeared from public view. It might have been different had he continued in Aberdeen, and gathered around him a body of young men ready to receive and to propagate the lessons he taught them. But he departed into other fields, -- into the literary circle of England, and a church which set more value on liturgy than on abstract doctrine, -- and there he met with few to appreciate his gifts. A Presbyterian Scot might have urged, with some plausibility, that his name has perished because he forsook the country and the church in which his philosophic labors would have been valued. It might even have been different, had he published his metaphysical {106} treatises a dozen of years earlier; for then they might have run their course with those of Hutcheson and Butler. But at the very time that Turnbull advertised his work on "Moral Philosophy," Hume published his "Treatise of Human Nature," which, as it forced its way to the front, required philosophy to deepen its foundations and give a new facing to its buttresses. Turnbull is remembered because he

had, for three years, when he was himself a very young man, a diligent and thoughtful pupil, who in due time wrestled with the great sceptic, and is acknowledged by Scotland as the representative of its native philosophy.

1875

XIII.-- DAVID FORDYCE. [27]

HE was born in Aberdeen in 1711, entered Marischal College in 1742, and was drowned at sea, as he was returning from travel, in September, 1751. During that age and the next there was a strong disposition towards the study of mental philosophy. In 1748, R. Dodsley began the publication of the " Preceptor," in London, and Fordyce wrote the article on " Moral Philosophy." He was appointed professor of moral philosophy in the college in which he bad been educated, in 1742. In 1745, he published " Dialogues concerning Education," a very pleasantly written book. He discusses the question whether nature or training does most, and inquires whether the Socratic method is fitted to bring forth what is in our nature. He dwells fondly, like most of the philosophers of the Scottish school, on the influence of the association of ideas. The religion he recommends was evidently the moderate type: " As the religion of Christ was designed as a plain, consistent rule of life, and not a system of abstracted reasonings and speculations, -- to influence the heart more than fill the head, -- I would endeavor above all things a high spirit of disinterested and extensive virtue." He was author also of an essay on "Action of the Pulpit." After his death there was published a work of his, " Theodorus, a Dialogue concerning the Art of Preaching," to which was added " A discourse on the Eloquence of the Pulpit, by James Fordyce." His " Elements of Moral Philosophy" was published in 1754. There is little that is original in his works, but much that is judicious and useful. It is evident that he was acquainted with the works of Butler and Hutcheson. " Moral philosophy contemplates human nature, its moral powers and connections, and deduces the laws of action." " Moral philosophy has this in common with natural {107} philosophy that it appeals to nature or to fact." He finds passions or affections, some private, some public, and above these; (1) reason or reflection; (2) conscience, by which we denominate some actions and principles of conduct honest and good, and others wrong, dishonest, or ill." " We came by the idea of moral obligation or duty in the same way as our other original and primary perceptions: we receive them from the Author of our nature." We employ reason in moral cases, in "examining the condition, relations, and other circumstances of the agent, and patient." " Therefore, when we use these terms, obligation, duty, ought, and the like, they stand for a simple idea." He opposes those who establish morals on the divine will, and those who place it in the natures and reasons, truths and fitnesses, of things."

XIV.-- WILLIAM DUNCAN.[28]

HE was born in Aberdeen, July, 1717, and was the son of a respectable tradesman. He received his education partly at Aberdeen and partly at Foveran. He entered Marischal College in 1733, and took his degree in 1737. Originally, he was designed for the gospel ministry; but not finding an inclination for the work, he went, as so many Scottish youths have done in like circumstances, to London (in 1739), and devoted himself to literature; translating " Select Orations of Cicero " and " Caesar's Commentaries," which were long found useful by youths averse to turn over the leaves of a dictionary. He wrote for Dodsley's " Preceptor " the article on " Logic and this was afterwards published in a separate volume, and continued for an age or two to furnish, not very philosophical but very useful, instruction to Scottish and other youths. The work is partly psychological partly logical. In Book First he treats of the origin and division of ideas, and of language; in the Second, of judgment, self-evident and demonstrable; in the Third, of reasoning and demonstration; and in the Fourth, of invention, science, and the parts, of knowledge. He was appointed professor of philosophy in Marischal College, May 18, 1752, and entered the professorship, Aug. 21, 1753. He was drowned when bathing, May, 1760.

XV.-- JOHN STEVENSON.[29]

FROM the date at which we have now arrived, we have a succession of distinguished men testifying to the benefit they received. from the instruction imparted in the departments of logic and moral philosophy in the Scotch colleges. As being among the eminently successful teachers of his age, we have to give a place to John Stevenson, professor of Logic or {108} "Rational and Instrumental philosophy" in the University of Edinburgh. Dugald Stewart says of him that to his ,valuable prelections, particularly to his illustrations of Aristotle's "Poetics," and of Longinus on the "Sublime," Dr. Robertson has been often heard to say, that lie considered himself as more deeply indebted than to any other circumstance in his academic studies." "I derived," says Dr. Somerville, "more substantial benefit from these exercises and lectures than from all the public classes I attended at the university." Similar testimony is borne by the famous leader of the evangelical party in the Church of Scotland, Dr. Erskine (see Life by Sir Henry W. Moncreiff). The course of instruction followed by Stevenson is given in the Scots Magazine, and is well worthy of being quoted as an exhibition of the highest style of education imparted in the age. He gives lectures upon "Heineccii Elementa Philosopliae Rationalis," and Wynne's abridgment of Locke's "Essay upon the Human Understanding: " in which he explains all the different forms of reasoning, the nature of certainty both mathematical and moral, with the different degrees of probability; and shows how the understanding is to be conducted in our inquiries after truth of all kinds. He likewise explains the fundamental rules to be observed in the interpretation of the texts of very ancient authors. He teaches metaphysics in lectures upon De Vries's "Ontologia," in which he explains the several terms and distinctions which frequently occur in the writings of the learned. He also lectures upon Longinus, in which he illustrates the several precepts of oratory given by Cicero and Quintilian; and also, upon Aristotle, in which he illustrates his rules by examples from ancient and modern poets, and explains the grounds of criticism in eloquence and poetry. He gives likewise a course upon "Heineccii Historia Philosophica," in which he gives an account of the most famous philosophers ancient and modern, and the several opinions by which the different sects were distinguished. Each of his students is required to make a discourse upon a subject assigned him, and to impugn and defend a thesis, for his improvement in the art of reasoning. These exercises are performed before the principal and some of the professors with open doors. The students met him two hours daily; one of them was devoted to lectures on logic, delivered in the Latin tongue. It is stated that the college opens about the 10th of October, and rises about the end of May. The shortening of the length of the session in the colleges of Scotland, in later years, has done much to lower the standard of attainment.

John Stevenson was appointed professor in Edinburgh, in 1730, and died Sept. 12th, 1775, in the eighty-first year of his age. It is mentioned to his credit, by Stewart, that at the age of seventy be gave a candid reception to the philosophy of Reid, which was subversive of the theories which he had taught for forty years; and that "his zeal for the advancement of knowledge prompted him, when his career was almost finished, to undertake the laborious task of new-modelling that useful compilation of elementary instruction to which a singular diffidence of his powers limited his literary exertions." (Stewart's " Life and Writings of Reid.") {109}

XVI.-- SIR JOHN PRINGLE.[30]

HE was for a time " professor of pneumatology and ethical philosophy " in Edinburgh University. The pneumatics are divided into the following parts: (1) A physical inquiry into the nature of such subtle and material substances as are imperceptible to the senses, and known only front their operations; (2) The nature of immaterial substances connected with matter, in which is demonstrated, by natural evidence, the immortality of the human soul (3) The nature of immaterial created beings not connected with matter (4) Natural theology, or the existence and attributes of God demonstrated front the light of nature. Ethics or moral philosophy is divided into the theoretical and practical parts, in treating of which the authors lie chiefly uses are Cicero, Marcus Antoninus, Puffendorf, and Lord Bacon. He had lectures explaining the origin and principles of civil government, illustrated with an account of the rise and fall of the ancient governments of Greece and Rome, and a view of that form of government which took its rise from the irruptions of the northern nations. His students have also discourses presented to them upon some important heads of pneumatical or moral philosophy, which are delivered before the principal with open doors. Pringle was by no means so thorough an instructor as Stevenson. Carlyle describes him "as an agreeable lecturer, though no great master of the science he taught." " His lectures were chiefly a compilation from Lord Bacon's works, and had it not been for Puffendorf's small book, which he made his text, we should not have been instructed in the rudiments of the science." Nevertheless, we see that he discussed topics which must issue, sooner or later, in a scientific jurisprudence and political economy. We see, in the case both of Stevenson and Pringle, how much attention was paid in the Scottish universities to the practice of English composition.

Pringle's taste did not lie specially in metaphysics. He was born in Roxburghshire, in 1707, and became a physician. He settled in Edinburgh about 1734; and after 1748, resided in London, where be was elected president of the Royal Society in 1773. He died in 1782

XVII.-- THOMAS BOSTON.

WE wish our readers to transport themselves to the eastern border country of Scotland, and to try to realize its condition in the first half of last century. People are apt to take their views of that district from Sir Walter Scott, who passed the most interesting portion of his boyhood there, and picking up the dim traditions of the past ere they were finally lost, and tingeing them with the romantic hues of his own imagination, has presented to us such a picture as a man of the nineteenth century, in love with chivalry, would be {110} likely to furnish of the ages of border strife. But the truth is, Sir Walter has given us only one side of the Scottish character; he never thoroughly sympathized with the more earnest features of the national mind, and he did not appreciate the attempts which were made in the seventeenth century to deliver the country from violence and superstition, and to Promote education and a scriptural religion. The people of the eighteenth century had such traditions of the earlier ages as to be glad that the days of the border raids had passed away. At the time we wish to sketch, two classes of people were to be found in the district. There were landed prorietors, disposed to allow no opposition to their not very generous or enlightened will, but who were already catching the taste for improving the land, which has made Berwickshire one of the most advanced agricultural districts in the three kingdoms. Under them were small farmers and their servants, with the ignorance and much of the rudeness of the previous ages, and not yet awakened to independent thought and action. Between them there was scarcely any middle class, except the parish ministers, who, in the early part of the century, if not highly cultivated, were zealous preachers of the doctrines of grace, and actively seeking to raise their people to church-going habits and a decent morality; and who, at a later date, as patrons began to assert their legal rights, and colleges adopted the new philosophy, became the most vehement opponents of the evangelical party: so that, in the days of Carlyle, the Synod of Merse and Teviotdale turned the vote against popular rights, and the ministers of it, coming to the General Assembly, rushed to the theatre to hear Mrs. Siddons when she happened to be in Edinburgh. Believing that there was nothing suited to them in such a religion, the common people set up in the towns and large villages seceding congregations, which drew towards them the more earnest of the inhabitants. Out of one of these congregations sprang Thomas M'Crie, who has given us the other phase of the Scottish character.

At the beginning of the century, the most remarkable man in the district was undoubtedly Thomas Boston. Born at Dunse in the previous century, he remembered his going, when a boy, to the prison of his native place to keep his father company when lie was incarcerated for resisting the imposition of Prelacy. All his life he is most sedulous and consistent in discountenancing the system

of church patronage, which is being steadily introduced. Settled as a minister first in Simprin, and then in Ettrick, he is consumingly earnest in visiting once a year, in catechising twice a year, and in preaching on Sabbath-day and week-day to, an ignorant and careless people just rising out of barbarism. But he contrived to retain a literary taste amidst his active parochial employments. With a difficulty in getting books, and rejoicing so when a good one came in his way, he was able, by his own independent study, to develop views in regard to the importance of Hebrew points which were far in advance of those attained in his time by any British scholar. Endowed with a clear, logical mind, he has, in his " Fourfold State " and " Covenant of Grace," given us perhaps the best exposition we have of the old Scotch theology in its excellencies,-- some would add, in its exclusiveness. Living and breathing in the doctrine of free grace, he seized with avidity and valued excessively the " Marrow of Modern Divinity," {111} which he found in the cottage of one of his people, and he vigorously opposed the moral or legal preaching which was fast coming in with the new literature and philosophy. Singularly single-minded, earnest, and fervent in his piety, this man becomes a favorite and a power, first in his district, and, in the end, by his theological works all over Scotland. In reading his Memoirs, we observe that lie was painfully careful in watching his moods of mind, often referring to spiritual interposition what arose from wretched health; and that he was ever looking on events occurring in God's providence as *signs* indicating that he should pursue a particular line of conduct. It needed a philosophy -- we regret that it should have been an infidel one which did the work -- to correct these errors of a narrow theology.[31]

James McCosh
1875

XVIII.-- DAVID DUDGEON.

ALREADY the old orthodoxy was being troubled. Mr. David Dudgeon published, in 1732, a work entitled "The Moral World." We have no record of the early history of this man, and we do not know whether he received a college education. When he comes under our notice, he is tenant of a large farm called Lennel Hill, in the parish of Coldstream. In the work referred to he maintains, with clearness and ability, a doctrine like that of Anthony Collins, whom he had read. He asserts " that there is no evil in the moral world but what necessarily ariseth from the nature of imperfect creatures, who always pursue their good, but cannot but be liable to error or mistake," and that evil or sin is inseparable in some degree from all created beings, and most consistent with the designs of a perfect Creator." On account of the errors in this work, he was summoned before the Presbytery, where two charges are brought against him: 1st, That he denies and destroys all distinction and difference between moral good and evil, or else makes God the author of evil, and refers all evil to the imperfection of creatures; 2d, That he denies the punishment of another life, or that God punishes men for sin in this life, -- yea, that man is accountable. He appears before the court, and holds it to be contrary to Scripture that man has free-will in the Arminian sense, but holds that man is accountable and punishable for practising contrary to the divine precepts of our Saviour, the practice of which tends to make all men happy. The case goes up from presbytery to synod, and from synod to General Assembly, which remits it to the Commission of Assembly in 1733, again in 1734, again in 1735, and again in 1736, with no evidence that the commission ever ventured {112} to take it up.[32] In 1734, he published a vindication of the " Moral World," in reply to a pamphlet against him, said to be written by Andrew Baxter; and therein he maintains that when a rogue is hanged he is set free to enter a state where he may be reformed. His most important work is " Philosophical Letters concerning the Being and Attributes of God," first printed in 1737. These letters were written, in the midst of pressing agricultural cares. to the Rev. Mr. Jackson, author of a work written in the spirit of Clarke, " The Existence and Unity of God." In these letters, Dudgeon reaches a species of refined Spinozism, mingled with Berkeleyanism. He denies the distinction of substances into spiritual and material, maintains that there is no substance distinct from God, and that "all our knowledge but of God is about ideas they exist only in the mind, and their essence and modes consist only in their being perceived." In 1739, he published a " Catechism founded upon Experience and Reason, collected by a Father for the use of his Children " and, in an introductory letter, lie wishes that natural religion alone was embraced by all men, and states that, though he believes there was an extraordinary man sent into our world seventeen hundred years ago to instruct mankind, yet he doubts whether he " ever commanded any of those

things to be written concerning him which we have." The same year, he published " A View of the Necessitarian or Best Scheme, freed from the Objections of M. Crousaz, in his Examination of Pope's `Essay on Man.'"

Dudgeon died at Upsettlington, on the borders of England, January, 1743, at the age of thirty-seven. His works were published in a combined form in 1765, in a volume without a printer's name attached, showing, that there was not as yet thorough freedom of thought in Scotland. His writings had for a time a name in the district (the " Catechism " reached a third edition), but afterwards passed away completely from public notice. The late Principal Lee was most anxious to know more of his history, and in particular whether he could have influenced David Hume in personal intercourse or by his writings. As they lived in the same district, Hume must have heard of the case, which appeared when Hume was cogitating his own system. There are points in which Dudgeon anticipated Hume. Thus, Dudgeon maintains that all knowledge is about ideas, the essence of which is that they are perceived. He says that the words "just, unjust, desert &c., are necessarily relative to society; " and that if we allow that there is not justice in the government of this world, we cannot argue that there is justice in the world to come. Dudgeon, too, is a stern necessarian. But in all these points Dudgeon had himself been anticipated by others. In other respects the two widely differ. Dudgeon assumes throughout a much higher moral tone than Hume ever did. Dudgeon had evidently abandoned a belief in Christianity, but he stood up resolutely for a rational demonstration of the existence of God as the cause of the ideas which come under our experience; and he has a whole system of natural religion: whereas Hume undermines all religion, natural as well as revealed. {113} Dudgeon had superior philosophic abilities; and in other circumstances might have had a chance of becoming the head of a new philosophic Heresy. But there was a young man in his own neighborhood being trained to supersede and eclipse him in his own line, and to go beyond deism to atheism. It is thus that error advances till it corrects itself.

On Liberty

J.S. Mill
1859

Chapter I: Introductory

THE subject of this Essay is not the so-called Liberty of the Will, so unfortunately opposed to the misnamed doctrine of Philosophical Necessity; but Civil, or Social Liberty: the nature and limits of the power which can be legitimately exercised by society over the individual. A question seldom stated, and hardly ever discussed, in general terms, but which profoundly influences the practical controversies of the age by its latent presence, and is likely soon to make itself recognized as the vital question of the future. It is so far from being new, that, in a certain sense, it has divided mankind, almost from the remotest ages, but in the stage of progress into which the more civilized portions of the species have now entered, it presents itself under new conditions, and requires a different and more fundamental treatment.

The struggle between Liberty and Authority is the most conspicuous feature in the portions of history with which we are earliest familiar, particularly in that of Greece, Rome, and England. But in old times this contest was between subjects, or some classes of subjects, and the government. By liberty, was meant protection against the tyranny of the political rulers. The rulers were conceived (except in some of the popular governments of Greece) as in a necessarily antagonistic position to the people whom they ruled. They consisted of a governing One, or a governing tribe or caste, who derived their authority from inheritance or conquest; who, at all events, did not hold it at the pleasure of the governed, and whose supremacy men did not venture, perhaps did not desire, to contest, whatever precautions might be taken against its oppressive exercise. Their power was regarded as necessary, but also as highly dangerous; as a weapon which they would attempt to use against their subjects, no less than against external enemies. To prevent the weaker members of the community from being preyed upon by innumerable vultures, it was needful that there should be an animal of prey stronger than the rest, commissioned to keep them down. But as the king of the vultures would be no less bent upon preying upon the flock than any of the minor harpies, it was indispensable to be in a perpetual attitude of defence against his beak and claws. The aim, therefore, of patriots, was to set limits to the power which the ruler should be suffered to exercise over the community; and this limitation was what they meant by liberty. It was attempted in two ways. First, by obtaining a recognition of certain immunities, called political liberties or rights, which it was to be regarded as a breach of duty in the ruler to infringe, and which, if he did infringe, specific resistance, or general rebellion, was held to be justifiable. A second, and generally a later expedient, was the establishment of constitutional checks; by which the consent of the community, or of a body of some sort supposed to represent its interests, was made a necessary condition to some of the more important acts of the governing power. To the first of these modes of

limitation, the ruling power, in most European countries, was compelled, more or less, to submit. It was not so with the second; and to attain this, or when already in some degree possessed, to attain it more completely, became everywhere the principal object of the lovers of liberty. And so long as mankind were content to combat one enemy by another, and to be ruled by a master, on condition of being guaranteed more or less efficaciously against his tyranny, they did not carry their aspirations beyond this point.

A time, however, came in the progress of human affairs, when men ceased to think it a necessity of nature that their governors should be an independent power, opposed in interest to themselves. It appeared to them much better that the various magistrates of the State should be their tenants or delegates, revocable at their pleasure. In that way alone, it seemed, could they have complete security that the powers of government would never be abused to their disadvantage. By degrees, this new demand for elective and temporary rulers became the prominent object of the exertions of the popular party, wherever any such party existed; and superseded, to a considerable extent, the previous efforts to limit the power of rulers. As the struggle proceeded for making the ruling power emanate from the periodical choice of the ruled, some persons began to think that too much importance had been attached to the limitation of the power itself. That (it might seem) was a resource against rulers whose interests were habitually opposed to those of the people. What was now wanted was, that the rulers should be identified with the people; that their interest and will should be the interest and will of the nation. The nation did not need to be protected against its own will. There was no fear of its tyrannizing over itself. Let the rulers be effectually responsible to it, promptly removable by it, and it could afford to trust them with power of which it could itself dictate the use to be made. Their power was but the nation's own power, concentrated, and in a form convenient for exercise. This mode of thought, or rather perhaps of feeling, was common among the last generation of European liberalism, in the Continental section of which, it still apparently predominates. Those who admit any limit to what a government may do, except in the case of such governments as they think ought not to exist, stand out as brilliant exceptions among the political thinkers of the Continent. A similar tone of sentiment might by this time have been prevalent in our own country, if the circumstances which for a time encouraged it had continued unaltered.

But, in political and philosophical theories, as well as in persons, success discloses faults and infirmities which failure might have concealed from observation. The notion, that the people have no need to limit their power over themselves, might seem axiomatic, when popular government was a thing only dreamed about, or read of as having existed at some distant period of the past. Neither was that notion necessarily disturbed by such temporary aberrations as those of the French Revolution, the worst of which were the work of an usurping few, and which, in any case, belonged, not to the permanent working of popular institutions, but to a sudden and convulsive outbreak against monarchical and aristocratic despotism. In time, however, a democratic republic came to occupy a large portion of the earth's surface, and made itself felt as one of the most powerful members of the community of nations; and elective and responsible government became subject to the observations and criticisms which wait upon a great existing fact. It was now perceived that such phrases as "self-government," and "the power of the people over themselves," do not express the true state of the case. The "people" who exercise the power, are not always the same people with those over whom it is exercised, and the "self-government" spoken of, is not the government of each by himself, but of each by all the rest. The will of the people, moreover, practically means, the will of the most numerous or the most active part of the people; the majority, or those who

succeed in making themselves accepted as the majority; the people, consequently, may desire to oppress a part of their number; and precautions are as much needed against this, as against any other abuse of power. The limitation, therefore, of the power of government over individuals, loses none of its importance when the holders of power are regularly accountable to the community, that is, to the strongest party therein. This view of things, recommending itself equally to the intelligence of thinkers and to the inclination of those important classes in European society to whose real or supposed interests democracy is adverse, has had no difficulty in establishing itself; and in political speculations "the tyranny of the majority" is now generally included among the evils against which society requires to be on its guard.

Like other tyrannies, the tyranny of the majority was at first, and is still vulgarly, held in dread, chiefly as operating through the acts of the public authorities. But reflecting persons perceived that when society is itself the tyrant -- society collectively, over the separate individuals who compose it -- its means of tyrannizing are not restricted to the acts which it may do by the hands of its political functionaries. Society can and does execute its own mandates: and if it issues wrong mandates instead of right, or any mandates at all in things with which it ought not to meddle, it practises a social tyranny more formidable than many kinds of political oppression, since, though not usually upheld by such extreme penalties, it leaves fewer means of escape, penetrating much more deeply into the details of life, and enslaving the soul itself. Protection, therefore, against the tyranny of the magistrate is not enough; there needs protection also against the tyranny of the prevailing opinion and feeling; against the tendency of society to impose, by other means than civil penalties, its own ideas and practices as rules of conduct on those who dissent from them; to fetter the development, and, if possible, prevent the formation, of any individuality not in harmony with its ways, and compel all characters to fashion themselves upon the model of its own. There is a limit to the legitimate interference of collective opinion with individual independence; and to find that limit, and maintain it against encroachment, is as indispensable to a good condition of human affairs, as protection against political despotism.

But though this proposition is not likely to be contested in general terms, the practical question, where to place the limit -- how to make the fitting adjustment between individual independence and social control -- is a subject on which nearly everything remains to be done. All that makes existence valuable to any one, depends on the enforcement of restraints upon the actions of other people. Some rules of conduct, therefore, must be imposed, by law in the first place, and by opinion on many things which are not fit subjects for the operation of law. What these rules should be, is the principal question in human affairs; but if we except a few of the most obvious cases, it is one of those which least progress has been made in resolving. No two ages, and scarcely any two countries, have decided it alike; and the decision of one age or country is a wonder to another. Yet the people of any given age and country no more suspect any difficulty in it, than if it were a subject on which mankind had always been agreed. The rules which obtain among themselves appear to them self-evident and self-justifying. This all but universal illusion is one of the examples of the magical influence of custom, which is not only, as the proverb says a second nature, but is continually mistaken for the first. The effect of custom, in preventing any misgiving respecting the rules of conduct which mankind impose on one another, is all the more complete because the subJect is one on which it is not generally considered necessary that reasons should be given, either by one person to others, or by each to himself. People are accustomed to believe and have been encouraged in the belief by some who aspire to the character of philosophers, that their feelings, on subjects of this nature, are better than reasons, and render reasons unnecessary. The practical

principle which guides them to their opinions on the regulation of human conduct, is the feeling in each person's mind that everybody should be required to act as he, and those with whom he sympathizes, would like them to act. No one, indeed, acknowledges to himself that his standard of judgment is his own liking; but an opinion on a point of conduct, not supported by reasons, can only count as one person's preference; and if the reasons, when given, are a mere appeal to a similar preference felt by other people, it is still only many people's liking instead of one. To an ordinary man, however, his own preference, thus supported, is not only a perfectly satisfactory reason, but the only one he generally has for any of his notions of morality, taste, or propriety, which are not expressly written in his religious creed; and his chief guide in the interpretation even of that. Men's opinions, accordingly, on what is laudable or blamable, are affected by all the multifarious causes which influence their wishes in regard to the conduct of others, and which are as numerous as those which determine their wishes on any other subject. Sometimes their reason -- at other times their prejudices or superstitions: often their social affections, not seldom their antisocial ones, their envy or jealousy, their arrogance or contemptuousness: but most commonly, their desires or fears for themselves -- their legitimate or illegitimate self-interest. Wherever there is an ascendant class, a large portion of the morality of the country emanates from its class interests, and its feelings of class superiority. The morality between Spartans and Helots, between planters and negroes, between princes and subjects, between nobles and roturiers, between men and women, has been for the most part the creation of these class interests and feelings: and the sentiments thus generated, react in turn upon the moral feelings of the members of the ascendant class, in their relations among themselves. Where, on the other hand, a class, formerly ascendant, has lost its ascendency, or where its ascendency is unpopular, the prevailing moral sentiments frequently bear the impress of an impatient dislike of superiority. Another grand determining principle of the rules of conduct, both in act and forbearance which have been enforced by law or opinion, has been the servility of mankind towards the supposed preferences or aversions of their temporal masters, or of their gods. This servility though essentially selfish, is not hypocrisy; it gives rise to perfectly genuine sentiments of abhorrence; it made men burn magicians and heretics. Among so many baser influences, the general and obvious interests of society have of course had a share, and a large one, in the direction of the moral sentiments: less, however, as a matter of reason, and on their own account, than as a consequence of the sympathies and antipathies which grew out of them: and sympathies and antipathies which had little or nothing to do with the interests of society, have made themselves felt in the establishment of moralities with quite as great force.

The likings and dislikings of society, or of some powerful portion of it, are thus the main thing which has practically determined the rules laid down for general observance, under the penalties of law or opinion. And in general, those who have been in advance of society in thought and feeling, have left this condition of things unassailed in principle, however they may have come into conflict with it in some of its details. They have occupied themselves rather in inquiring what things society ought to like or dislike, than in questioning whether its likings or dislikings should be a law to individuals. They preferred endeavouring to alter the feelings of mankind on the particular points on which they were themselves heretical, rather than make common cause in defence of freedom, with heretics generally. The only case in which the higher ground has been taken on principle and maintained with consistency, by any but an individual here and there, is that of religious belief: a case instructive in many ways, and not least so as forming a most striking instance of the fallibility of what is called the moral sense: for the odium theologicum, in a sincere bigot, is one of the most

unequivocal cases of moral feeling. Those who first broke the yoke of what called itself the Universal Church, were in general as little willing to permit difference of religious opinion as that church itself. But when the heat of the conflict was over, without giving a complete victory to any party, and each church or sect was reduced to limit its hopes to retaining possession of the ground it already occupied; minorities, seeing that they had no chance of becoming majorities, were under the necessity of pleading to those whom they could not convert, for permission to differ. It is accordingly on this battle-field, almost solely, that the rights of the individual against society have been asserted on broad grounds of principle, and the claim of society to exercise authority over dissentients openly controverted. The great writers to whom the world owes what religious liberty it possesses, have mostly asserted freedom of conscience as an indefeasible right, and denied absolutely that a human being is accountable to others for his religious belief. Yet so natural to mankind is intolerance in whatever they really care about, that religious freedom has hardly anywhere been practically realized, except where religious indifference, which dislikes to have its peace disturbed by theological quarrels, has added its weight to the scale. In the minds of almost all religious persons, even in the most tolerant countries, the duty of toleration is admitted with tacit reserves. One person will bear with dissent in matters of church government, but not of dogma; another can tolerate everybody, short of a Papist or an Unitarian; another, every one who believes in revealed religion; a few extend their charity a little further, but stop at the belief in a God and in a future state. Wherever the sentiment of the majority is still genuine and intense, it is found to have abated little of its claim to be obeyed.

In England, from the peculiar circumstances of our political history, though the yoke of opinion is perhaps heavier, that of law is lighter, than in most other countries of Europe; and there is considerable jealousy of direct interference, by the legislative or the executive power with private conduct; not so much from any just regard for the independence of the individual, as from the still subsisting habit of looking on the government as representing an opposite interest to the public. The majority have not yet learnt to feel the power of the government their power, or its opinions their opinions. When they do so, individual liberty will probably be as much exposed to invasion from the government, as it already is from public opinion. But, as yet, there is a considerable amount of feeling ready to be called forth against any attempt of the law to control individuals in things in which they have not hitherto been accustomed to be controlled by it; and this with very little discrimination as to whether the matter is, or is not, within the legitimate sphere of legal control; insomuch that the feeling, highly salutary on the whole, is perhaps quite as often misplaced as well grounded in the particular instances of its application.

There is, in fact, no recognized principle by which the propriety or impropriety of government interference is customarily tested. People decide according to their personal preferences. Some, whenever they see any good to be done, or evil to be remedied, would willingly instigate the government to undertake the business; while others prefer to bear almost any amount of social evil, rather than add one to the departments of human interests amenable to governmental control. And men range themselves on one or the other side in any particular case, according to this general direction of their sentiments; or according to the degree of interest which they feel in the particular thing which it is proposed that the government should do; or according to the belief they entertain that the government would, or would not, do it in the manner they prefer; but very rarely on account of any opinion to which they consistently adhere, as to what things are fit to be done by a government. And it seems to me that, in consequence of this absence of rule or principle, one side is at present as often wrong as the other; the interference of government is, with about equal

frequency, improperly invoked and improperly condemned.

The object of this Essay is to assert one very simple principle, as entitled to govern absolutely the dealings of society with the individual in the way of compulsion and control, whether the means used be physical force in the form of legal penalties, or the moral coercion of public opinion. That principle is, that the sole end for which mankind are warranted, individually or collectively in interfering with the liberty of action of any of their number, is self-protection. That the only purpose for which power can be rightfully exercised over any member of a civilized community, against his will, is to prevent harm to others. His own good, either physical or moral, is not a sufficient warrant. He cannot rightfully be compelled to do or forbear because it will be better for him to do so, because it will make him happier, because, in the opinions of others, to do so would be wise, or even right. These are good reasons for remonstrating with him, or reasoning with him, or persuading him, or entreating him, but not for compelling him, or visiting him with any evil, in case he do otherwise. To justify that, the conduct from which it is desired to deter him must be calculated to produce evil to some one else. The only part of the conduct of any one, for which he is amenable to society, is that which concerns others. In the part which merely concerns himself, his independence is, of right, absolute. Over himself, over his own body and mind, the individual is sovereign.

It is, perhaps, hardly necessary to say that this doctrine is meant to apply only to human beings in the maturity of their faculties. We are not speaking of children, or of young persons below the age which the law may fix as that of manhood or womanhood. Those who are still in a state to require being taken care of by others, must be protected against their own actions as well as against external injury. For the same reason, we may leave out of consideration those backward states of society in which the race itself may be considered as in its nonage. The early difficulties in the way of spontaneous progress are so great, that there is seldom any choice of means for overcoming them; and a ruler full of the spirit of improvement is warranted in the use of any expedients that will attain an end, perhaps otherwise unattainable. Despotism is a legitimate mode of government in dealing with barbarians, provided the end be their improvement, and the means justified by actually effecting that end. Liberty, as a principle, has no application to any state of things anterior to the time when mankind have become capable of being improved by free and equal discussion. Until then, there is nothing for them but implicit obedience to an Akbar or a Charlemagne, if they are so fortunate as to find one. But as soon as mankind have attained the capacity of being guided to their own improvement by conviction or persuasion (a period long since reached in all nations with whom we need here concern ourselves), compulsion, either in the direct form or in that of pains and penalties for non-compliance, is no longer admissible as a means to their own good, and justifiable only for the security of others.

It is proper to state that I forego any advantage which could be derived to my argument from the idea of abstract right as a thing independent of utility. I regard utility as the ultimate appeal on all ethical questions; but it must be utility in the largest sense, grounded on the permanent interests of man as a progressive being. Those interests, I contend, authorize the subjection of individual spontaneity to external control, only in respect to those actions of each, which concern the interest of other people. If any one does an act hurtful to others, there is a prima facie case for punishing him, by law, or, where legal penalties are not safely applicable, by general disapprobation. There are also many positive acts for the benefit of others, which he may rightfully be compelled to perform; such as, to give evidence in a court of justice; to bear his fair share in the common defence, or in any other joint work necessary to the interest of the society of which he enjoys the

protection; and to perform certain acts of individual beneficence, such as saving a fellow-creature's life, or interposing to protect the defenceless against ill-usage, things which whenever it is obviously a man's duty to do, he may rightfully be made responsible to society for not doing. A person may cause evil to others not only by his actions but by his inaction, and in neither case he is justly accountable to them for the injury. The latter case, it is true, requires a much more cautious exercise of compulsion than the former. To make any one answerable for doing evil to others, is the rule; to make him answerable for not preventing evil, is, comparatively speaking, the exception. Yet there are many cases clear enough and grave enough to justify that exception. In all things which regard the external relations of the individual, he is de jure amenable to those whose interests are concerned, and if need be, to society as their protector. There are often good reasons for not holding him to the responsibility; but these reasons must arise from the special expediencies of the case: either because it is a kind of case in which he is on the whole likely to act better, when left to his own discretion, than when controlled in any way in which society have it in their power to control him; or because the attempt to exercise control would produce other evils, greater than those which it would prevent. When such reasons as these preclude the enforcement of responsibility, the conscience of the agent himself should step into the vacant judgment-seat, and protect those interests of others which have no external protection; judging himself all the more rigidly, because the case does not admit of his being made accountable to the judgment of his fellowcreatures.

But there is a sphere of action in which society, as distinguished from the individual, has, if any, only an indirect interest; comprehending all that portion of a person's life and conduct which affects only himself, or, if it also affects others, only with their free, voluntary, and undeceived consent and participation. When I say only himself, I mean directly, and in the first instance: for whatever affects himself, may affect others through himself; and the objection which may be grounded on this contingency, will receive consideration in the sequel. This, then, is the appropriate region of human liberty. It comprises, first, the inward domain of consciousness; demanding liberty of conscience, in the most comprehensive sense; liberty of thought and feeling; absolute freedom of opinion and sentiment on all subjects, practical or speculative, scientific, moral, or theological. The liberty of expressing and publishing opinions may seem to fall under a different principle, since it belongs to that part of the conduct of an individual which concerns other people; but, being almost of as much importance as the liberty of thought itself, and resting in great part on the same reasons, is practically inseparable from it. Secondly, the principle requires liberty of tastes and pursuits; of framing the plan of our life to suit our own character; of doing as we like, subject to such consequences as may follow; without impediment from our fellow-creatures, so long as what we do does not harm them even though they should think our conduct foolish, perverse, or wrong. Thirdly, from this liberty of each individual, follows the liberty, within the same limits, of combination among individuals; freedom to unite, for any purpose not involving harm to others: the persons combining being supposed to be of full age, and not forced or deceived.

No society in which these liberties are not, on the whole, respected, is free, whatever may be its form of government; and none is completely free in which they do not exist absolute and unqualified. The only freedom which deserves the name, is that of pursuing our own good in our own way, so long as we do not attempt to deprive others of theirs, or impede their efforts to obtain it. Each is the proper guardian of his own health, whether bodily, or mental or spiritual. Mankind are greater gainers by suffering each other to live as seems good to themselves, than by compelling

each to live as seems good to the rest.

Though this doctrine is anything but new, and, to some persons, may have the air of a truism, there is no doctrine which stands more directly opposed to the general tendency of existing opinion and practice. Society has expended fully as much effort in the attempt (according to its lights) to compel people to conform to its notions of personal, as of social excellence. The ancient commonwealths thought themselves entitled to practise, and the ancient philosophers countenanced, the regulation of every part of private conduct by public authority, on the ground that the State had a deep interest in the whole bodily and mental discipline of every one of its citizens, a mode of thinking which may have been admissible in small republics surrounded by powerful enemies, in constant peril of being subverted by foreign attack or internal commotion, and to which even a short interval of relaxed energy and self-command might so easily be fatal, that they could not afford to wait for the salutary permanent effects of freedom. In the modern world, the greater size of political communities, and above all, the separation between the spiritual and temporal authority (which placed the direction of men's consciences in other hands than those which controlled their worldly affairs), prevented so great an interference by law in the details of private life; but the engines of moral repression have been wielded more strenuously against divergence from the reigning opinion in self-regarding, than even in social matters; religion, the most powerful of the elements which have entered into the formation of moral feeling, having almost always been governed either by the ambition of a hierarchy, seeking control over every department of human conduct, or by the spirit of Puritanism. And some of those modern reformers who have placed themselves in strongest opposition to the religions of the past, have been noway behind either churches or sects in their assertion of the right of spiritual domination: M. Comte, in particular, whose social system, as unfolded in his Traite de Politique Positive, aims at establishing (though by moral more than by legal appliances) a despotism of society over the individual, surpassing anything contemplated in the political ideal of the most rigid disciplinarian among the ancient philosophers.

Apart from the peculiar tenets of individual thinkers, there is also in the world at large an increasing inclination to stretch unduly the powers of society over the individual, both by the force of opinion and even by that of legislation: and as the tendency of all the changes taking place in the world is to strengthen society, and diminish the power of the individual, this encroachment is not one of the evils which tend spontaneously to disappear, but, on the contrary, to grow more and more formidable. The disposition of mankind, whether as rulers or as fellow-citizens, to impose their own opinions and inclinations as a rule of conduct on others, is so energetically supported by some of the best and by some of the worst feelings incident to human nature, that it is hardly ever kept under restraint by anything but want of power; and as the power is not declining, but growing, unless a strong barrier of moral conviction can be raised against the mischief, we must expect, in the present circumstances of the world, to see it increase.

It will be convenient for the argument, if, instead of at once entering upon the general thesis, we confine ourselves in the first instance to a single branch of it, on which the principle here stated is, if not fully, yet to a certain point, recognized by the current opinions. This one branch is the Liberty of Thought: from which it is impossible to separate the cognate liberty of speaking and of writing. Although these liberties, to some considerable amount, form part of the political morality of all countries which profess religious toleration and free institutions, the grounds, both philosophical and practical, on which they rest, are perhaps not so familiar to the general mind, nor so thoroughly appreciated by many even of the leaders of opinion, as might have been

expected. Those grounds, when rightly understood, are of much wider application than to only one division of the subject, and a thorough consideration of this part of the question will be found the best introduction to the remainder. Those to whom nothing which I am about to say will be new, may therefore, I hope, excuse me, if on a subject which for now three centuries has been so often discussed, I venture on one discussion more.

On Liberty

J.S. Mill

1859

Chapter II: Of The Liberty Of Thought And Discussion

THE time, it is to be hoped, is gone by when any defence would be necessary of the "liberty of the press" as one of the securities against corrupt or tyrannical government. No argument, we may suppose, can now be needed, against permitting a legislature or an executive, not identified in interest with the people, to prescribe opinions to them, and determine what doctrines or what arguments they shall be allowed to hear. This aspect of the question, besides, has been so often and so triumphantly enforced by preceding writers, that it needs not be specially insisted on in this place. Though the law of England, on the subject of the press, is as servile to this day as it was in the time of the Tudors, there is little danger of its being actually put in force against political discussion, except during some temporary panic, when fear of insurrection drives ministers and judges from their propriety;[1] and, speaking generally, it is not, in constitutional countries, to be apprehended that the government, whether completely responsible to the people or not, will often attempt to control the expression of opinion, except when in doing so it makes itself the organ of the general intolerance of the public. Let us suppose, therefore, that the government is entirely at one with the people, and never thinks of exerting any power of coercion unless in agreement with what it conceives to be their voice. But I deny the right of the people to exercise such coercion, either by themselves or by their government. The power itself is illegitimate. The best government has no more title to it than the worst. It is as noxious, or more noxious, when exerted in accordance with public opinion, than when in opposition to it. If all mankind minus one, were of one opinion, and only one person were of the contrary opinion, mankind would be no more justified in silencing that one person, than he, if he had the power, would be justified in silencing mankind. Were an opinion a personal possession of no value except to the owner; if to be obstructed in the enjoyment of it were simply a private injury, it would make some difference whether the injury was inflicted only on a few persons or on many. But the peculiar evil of silencing the expression of an opinion is, that it is robbing the human race; posterity as well as the existing generation; those who dissent from the opinion, still more than those who hold it. If the opinion is right, they are deprived of the opportunity of exchanging error for truth: if wrong, they lose, what is almost as great a benefit, the clearer perception and livelier impression of truth, produced by its collision with error.

It is necessary to consider separately these two hypotheses, each of which has a distinct branch of the argument corresponding to it. We can never be sure that the opinion we are endeavouring to stifle is a false opinion; and if we were sure, stifling it would be an evil still.

First: the opinion which it is attempted to suppress by authority may possibly be true. Those who desire to suppress it, of course deny its truth; but they are not infallible. They have no authority to decide the question for all mankind, and exclude every other person from the means of judging. To refuse a hearing to an opinion, because they are sure that it is false, is to assume that their certainty is the same thing as absolute certainty. All silencing of discussion is an assumption of infallibility. Its condemnation may be allowed to rest on this common argument, not the worse for being common.

Unfortunately for the good sense of mankind, the fact of their fallibility is far from carrying the weight in their practical judgment, which is always allowed to it in theory; for while every one well knows himself to be fallible, few think it necessary to take any precautions against their own fallibility, or admit the supposition that any opinion of which they feel very certain, may be one of the examples of the error to which they acknowledge themselves to be liable. Absolute princes, or others who are accustomed to unlimited deference, usually feel this complete confidence in their own opinions on nearly all subjects. People more happily situated, who sometimes hear their opinions disputed, and are not wholly unused to be set right when they are wrong, place the same unbounded reliance only on such of their opinions as are shared by all who surround them, or to whom they habitually defer: for in proportion to a man's want of confidence in his own solitary judgment, does he usually repose, with implicit trust, on the infallibility of "the world" in general. And the world, to each individual, means the part of it with which he comes in contact; his party, his sect, his church, his class of society: the man may be called, by comparison, almost liberal and largeminded to whom it means anything so comprehensive as his own country or his own age. Nor is his faith in this collective authority at all shaken by his being aware that other ages, countries, sects, churches, classes, and parties have thought, and even now think, the exact reverse. He devolves upon his own world the responsibility of being in the right against the dissentient worlds of other people; and it never troubles him that mere accident has decided which of these numerous worlds is the object of his reliance, and that the same causes which make him a Churchman in London, would have made him a Buddhist or a Confucian in Pekin. Yet it is as evident in itself as any amount of argument can make it, that ages are no more infallible than individuals; every age having held many opinions which subsequent ages have deemed not only false but absurd; and it is as certain that many opinions, now general, will be rejected by future ages, as it is that many, once general, are rejected by the present.

The objection likely to be made to this argument, would probably take some such form as the following. There is no greater assumption of infallibility in forbidding the propagation of error, than in any other thing which is done by public authority on its own judgment and responsibility. Judgment is given to men that they may use it. Because it may be used erroneously, are men to be told that they ought not to use it at all? To prohibit what they think pernicious, is not claiming exemption from error, but fulfilling the duty incumbent on them, although fallible, of acting on their conscientious conviction. If we were never to act on our opinions, because those opinions may be wrong, we should leave all our interests uncared for, and all our duties unperformed. An objection which applies to all conduct can be no valid objection to any conduct in particular.

It is the duty of governments, and of individuals, to form the truest opinions they can; to form them carefully, and never impose them upon others unless they are quite sure of being right. But when they are sure (such reasoners may say), it is not conscientiousness but cowardice to shrink from acting on their opinions, and allow doctrines which they honestly think dangerous to the welfare of mankind, either in this life or in another, to be scattered abroad without restraint,

because other people, in less enlightened times, have persecuted opinions now believed to be true. Let us take care, it may be said, not to make the same mistake: but governments and nations have made mistakes in other things, which are not denied to be fit subjects for the exercise of authority: they have laid on bad taxes, made unjust wars. Ought we therefore to lay on no taxes, and, under whatever provocation, make no wars? Men, and governments, must act to the best of their ability. There is no such thing as absolute certainty, but there is assurance sufficient for the purposes of human life. We may, and must, assume our opinion to be true for the guidance of our own conduct: and it is assuming no more when we forbid bad men to pervert society by the propagation of opinions which we regard as false and pernicious.

I answer, that it is assuming very much more. There is the greatest difference between presuming an opinion to be true, because, with every opportunity for contesting it, it has not been refuted, and assuming its truth for the purpose of not permitting its refutation. Complete liberty of contradicting and disproving our opinion, is the very condition which justifies us in assuming its truth for purposes of action; and on no other terms can a being with human faculties have any rational assurance of being right.

When we consider either the history of opinion, or the ordinary conduct of human life, to what is it to be ascribed that the one and the other are no worse than they are? Not certainly to the inherent force of the human understanding; for, on any matter not self-evident, there are ninety-nine persons totally incapable of judging of it, for one who is capable; and the capacity of the hundredth person is only comparative; for the majority of the eminent men of every past generation held many opinions now known to be erroneous, and did or approved numerous things which no one will now justify. Why is it, then, that there is on the whole a preponderance among mankind of rational opinions and rational conduct? If there really is this preponderance -- which there must be, unless human affairs are, and have always been, in an almost desperate state -- it is owing to a quality of the human mind, the source of everything respectable in man, either as an intellectual or as a moral being, namely, that his errors are corrigible. He is capable of rectifying his mistakes by discussion and experience. Not by experience alone. There must be discussion, to show how experience is to be interpreted. Wrong opinions and practices gradually yield to fact and argument: but facts and arguments, to produce any effect on the mind, must be brought before it. Very few facts are able to tell their own story, without comments to bring out their meaning. The whole strength and value, then, of human judgment, depending on the one property, that it can be set right when it is wrong, reliance can be placed on it only when the means of setting it right are kept constantly at hand. In the case of any person whose judgment is really deserving of confidence, how has it become so? Because he has kept his mind open to criticism of his opinions and conduct. Because it has been his practice to listen to all that could be said against him; to profit by as much of it as was just, and expound to himself, and upon occasion to others, the fallacy of what was fallacious. Because he has felt, that the only way in which a human being can make some approach to knowing the whole of a subject, is by hearing what can be said about it by persons of every variety of opinion, and studying all modes in which it can be looked at by every character of mind. No wise man ever acquired his wisdom in any mode but this; nor is it in the nature of human intellect to become wise in any other manner. The steady habit of correcting and completing his own opinion by collating it with those of others, so far from causing doubt and hesitation in carrying it into practice, is the only stable foundation for a just reliance on it: for, being cognizant of all that can, at least obviously, be said against him, and having taken up his position against all gainsayers knowing that he has sought for objections and difficulties, instead of avoiding them, and

has shut out no light which can be thrown upon the subject from any quarter -- he has a right to think his judgment better than that of any person, or any multitude, who have not gone through a similar process.

It is not too much to require that what the wisest of mankind, those who are best entitled to trust their own judgment, find necessary to warrant their relying on it, should be submitted to by that miscellaneous collection of a few wise and many foolish individuals, called the public. The most intolerant of churches, the Roman Catholic Church, even at the canonization of a saint, admits, and listens patiently to, a "devil's advocate." The holiest of men, it appears, cannot be admitted to posthumous honors, until all that the devil could say against him is known and weighed. If even the Newtonian philosophy were not permitted to be questioned, mankind could not feel as complete assurance of its truth as they now do. The beliefs which we have most warrant for, have no safeguard to rest on, but a standing invitation to the whole world to prove them unfounded. If the challenge is not accepted, or is accepted and the attempt fails, we are far enough from certainty still; but we have done the best that the existing state of human reason admits of; we have neglected nothing that could give the truth a chance of reaching us: if the lists are kept open, we may hope that if there be a better truth, it will be found when the human mind is capable of receiving it; and in the meantime we may rely on having attained such approach to truth, as is possible in our own day. This is the amount of certainty attainable by a fallible being, and this the sole way of attaining it.

Strange it is, that men should admit the validity of the arguments for free discussion, but object to their being "pushed to an extreme;" not seeing that unless the reasons are good for an extreme case, they are not good for any case. Strange that they should imagine that they are not assuming infallibility when they acknowledge that there should be free discussion on all subjects which can possibly be doubtful, but think that some particular principle or doctrine should be forbidden to be questioned because it is so certain, that is, because they are certain that it is certain. To call any proposition certain, while there is any one who would deny its certainty if permitted, but who is not permitted, is to assume that we ourselves, and those who agree with us, are the judges of certainty, and judges without hearing the other side.

In the present age -- which has been described as "destitute of faith, but terrified at scepticism," -- in which people feel sure, not so much that their opinions are true, as that they should not know what to do without them -- the claims of an opinion to be protected from public attack are rested not so much on its truth, as on its importance to society. There are, it is alleged, certain beliefs, so useful, not to say indispensable to well-being, that it is as much the duty of governments to uphold those beliefs, as to protect any other of the interests of society. In a case of such necessity, and so directly in the line of their duty, something less than infallibility may, it is maintained, warrant, and even bind, governments, to act on their own opinion, confirmed by the general opinion of mankind. It is also often argued, and still oftener thought, that none but bad men would desire to weaken these salutary beliefs; and there can be nothing wrong, it is thought, in restraining bad men, and prohibiting what only such men would wish to practise. This mode of thinking makes the justification of restraints on discussion not a question of the truth of doctrines, but of their usefulness; and flatters itself by that means to escape the responsibility of claiming to be an infallible judge of opinions. But those who thus satisfy themselves, do not perceive that the assumption of infallibility is merely shifted from one point to another. The usefulness of an opinion is itself matter of opinion: as disputable, as open to discussion and requiring discussion as much, as the opinion itself. There is the same need of an infallible judge of opinions to decide an opinion to

be noxious, as to decide it to be false, unless the opinion condemned has full opportunity of defending itself. And it will not do to say that the heretic may be allowed to maintain the utility or harmlessness of his opinion, though forbidden to maintain its truth. The truth of an opinion is part of its utility. If we would know whether or not it is desirable that a proposition should be believed, is it possible to exclude the consideration of whether or not it is true? In the opinion, not of bad men, but of the best men, no belief which is contrary to truth can be really useful: and can you prevent such men from urging that plea, when they are charged with culpability for denying some doctrine which they are told is useful, but which they believe to be false? Those who are on the side of received opinions, never fail to take all possible advantage of this plea; you do not find them handling the question of utility as if it could be completely abstracted from that of truth: on the contrary, it is, above all, because their doctrine is "the truth," that the knowledge or the belief of it is held to be so indispensable. There can be no fair discussion of the question of usefulness, when an argument so vital may be employed on one side, but not on the other. And in point of fact, when law or public feeling do not permit the truth of an opinion to be disputed, they are just as little tolerant of a denial of its usefulness. The utmost they allow is an extenuation of its absolute necessity or of the positive guilt of rejecting it.

In order more fully to illustrate the mischief of denying a hearing to opinions because we, in our own judgment, have condemned them, it will be desirable to fix down the discussion to a concrete case; and I choose, by preference, the cases which are least favourable to me -- in which the argument against freedom of opinion, both on the score of truth and on that of utility, is considered the strongest. Let the opinions impugned be the belief in a God and in a future state, or any of the commonly received doctrines of morality. To fight the battle on such ground, gives a great advantage to an unfair antagonist; since he will be sure to say (and many who have no desire to be unfair will say it internally), Are these the doctrines which you do not deem sufficiently certain to be taken under the protection of law? Is the belief in a God one of the opinions, to feel sure of which, you hold to be assuming infallibility? But I must be permitted to observe, that it is not the feeling sure of a doctrine (be it what it may) which I call an assumption of infallibility. It is the undertaking to decide that question for others, without allowing them to hear what can be said on the contrary side. And I denounce and reprobate this pretension not the less, if put forth on the side of my most solemn convictions. However positive any one's persuasion may be, not only of the falsity, but of the pernicious consequences -- not only of the pernicious consequences, but (to adopt expressions which I altogether condemn) the immorality and impiety of an opinion; yet if, in pursuance of that private judgment, though backed by the public judgment of his country or his cotemporaries, he prevents the opinion from being heard in its defence, he assumes infallibility. And so far from the assumption being less objectionable or less dangerous because the opinion is called immoral or impious, this is the case of all others in which it is most fatal. These are exactly the occasions on which the men of one generation commit those dreadful mistakes which excite the astonishment and horror of posterity. It is among such that we find the instances memorable in history, when the arm of the law has been employed to root out the best men and the noblest doctrines; with deplorable success as to the men, though some of the doctrines have survived to be (as if in mockery) invoked, in defence of similar conduct towards those who dissent from them, or from their received interpretation.

Mankind can hardly be too often reminded, that there was once a man named Socrates, between whom and the legal authorities and public opinion of his time, there took place a memorable collision. Born in an age and country abounding in individual greatness, this man has been handed

down to us by those who best knew both him and the age, as the most virtuous man in it; while we know him as the head and prototype of all subsequent teachers of virtue, the source equally of the lofty inspiration of Plato and the judicious utilitarianism of Aristotle, "i maestri di color che sanno," the two headsprings of ethical as of all other philosophy. This acknowledged master of all the eminent thinkers who have since lived -- whose fame, still growing after more than two thousand years, all but outweighs the whole remainder of the names which make his native city illustrious -- was put to death by his countrymen, after a judicial conviction, for impiety and immorality. Impiety, in denying the gods recognized by the State; indeed his accuser asserted (see the "Apologia") that he believed in no gods at all. Immorality, in being, by his doctrines and instructions, a "corrupter of youth." Of these charges the tribunal, there is every ground for believing, honestly found him guilty, and condemned the man who probably of all then born had deserved best of mankind, to be put to death as a criminal.

To pass from this to the only other instance of judicial iniquity, the mention of which, after the condemnation of Socrates, would not be an anti-climax: the event which took place on Calvary rather more than eighteen hundred years ago. The man who left on the memory of those who witnessed his life and conversation, such an impression of his moral grandeur, that eighteen subsequent centuries have done homage to him as the Almighty in person, was ignominiously put to death, as what? As a blasphemer. Men did not merely mistake their benefactor; they mistook him for the exact contrary of what he was, and treated him as that prodigy of impiety, which they themselves are now held to be, for their treatment of him. The feelings with which mankind now regard these lamentable transactions, especially the latter of the two, render them extremely unjust in their judgment of the unhappy actors. These were, to all appearance, not bad men -- not worse than men most commonly are, but rather the contrary; men who possessed in a full, or somewhat more than a full measure, the religious, moral, and patriotic feelings of their time and people: the very kind of men who, in all times, our own included, have every chance of passing through life blameless and respected. The high-priest who rent his garments when the words were pronounced, which, according to all the ideas of his country, constituted the blackest guilt, was in all probability quite as sincere in his horror and indignation, as the generality of respectable and pious men now are in the religious and moral sentiments they profess; and most of those who now shudder at his conduct, if they had lived in his time and been born Jews, would have acted precisely as he did. Orthodox Christians who are tempted to think that those who stoned to death the first martyrs must have been worse men than they themselves are, ought to remember that one of those persecutors was Saint Paul.

Let us add one more example, the most striking of all, if the impressiveness of an error is measured by the wisdom and virtue of him who falls into it. If ever any one, possessed of power, had grounds for thinking himself the best and most enlightened among his cotemporaries, it was the Emperor Marcus Aurelius. Absolute monarch of the whole civilized world, he preserved through life not only the most unblemished justice, but what was less to be expected from his Stoical breeding, the tenderest heart. The few failings which are attributed to him, were all on the side of indulgence: while his writings, the highest ethical product of the ancient mind, differ scarcely perceptibly, if they differ at all, from the most characteristic teachings of Christ. This man, a better Christian in all but the dogmatic sense of the word, than almost any of the ostensibly Christian sovereigns who have since reigned, persecuted Christianity. Placed at the summit of all the previous attainments of humanity, with an open, unfettered intellect, and a character which led him of himself to embody in his moral writings the Christian ideal, he yet failed to see that Christianity was to be a good and

not an evil to the world, with his duties to which he was so deeply penetrated. Existing society he knew to be in a deplorable state. But such as it was, he saw or thought he saw, that it was held together and prevented from being worse, by belief and reverence of the received divinities. As a ruler of mankind, he deemed it his duty not to suffer society to fall in pieces; and saw not how, if its existing ties were removed, any others could be formed which could again knit it together. The new religion openly aimed at dissolving these ties: unless, therefore, it was his duty to adopt that religion, it seemed to be his duty to put it down. Inasmuch then as the theology of Christianity did not appear to him true or of divine origin; inasmuch as this strange history of a crucified God was not credible to him, and a system which purported to rest entirely upon a foundation to him so wholly unbelievable, could not be foreseen by him to be that renovating agency which, after all abatements, it has in fact proved to be; the gentlest and most amiable of philosophers and rulers, under a solemn sense of duty, authorized the persecution of Christianity. To my mind this is one of the most tragical facts in all history. It is a bitter thought, how different a thing the Christianity of the world might have been, if the Christian faith had been adopted as the religion of the empire under the auspices of Marcus Aurelius instead of those of Constantine. But it would be equally unjust to him and false to truth, to deny, that no one plea which can be urged for punishing anti-Christian teaching, was wanting to Marcus Aurelius for punishing, as he did, the propagation of Christianity. No Christian more firmly believes that Atheism is false, and tends to the dissolution of society, than Marcus Aurelius believed the same things of Christianity; he who, of all men then living, might have been thought the most capable of appreciating it. Unless any one who approves of punishment for the promulgation of opinions, flatters himself that he is a wiser and better man than Marcus Aurelius -- more deeply versed in the wisdom of his time, more elevated in his intellect above it -- more earnest in his search for truth, or more single-minded in his devotion to it when found; -- let him abstain from that assumption of the joint infallibility of himself and the multitude, which the great Antoninus made with so unfortunate a result.

Aware of the impossibility of defending the use of punishment for restraining irreligious opinions, by any argument which will not justify Marcus Antoninus, the enemies of religious freedom, when hard pressed, occasionally accept this consequence, and say, with Dr. Johnson, that the persecutors of Christianity were in the right; that persecution is an ordeal through which truth ought to pass, and always passes successfully, legal penalties being, in the end, powerless against truth, though sometimes beneficially effective against mischievous errors. This is a form of the argument for religious intolerance, sufficiently remarkable not to be passed without notice.

A theory which maintains that truth may justifiably be persecuted because persecution cannot possibly do it any harm, cannot be charged with being intentionally hostile to the reception of new truths; but we cannot commend the generosity of its dealing with the persons to whom mankind are indebted for them. To discover to the world something which deeply concerns it, and of which it was previously ignorant; to prove to it that it had been mistaken on some vital point of temporal or spiritual interest, is as important a service as a human being can render to his fellow-creatures, and in certain cases, as in those of the early Christians and of the Reformers, those who think with Dr. Johnson believe it to have been the most precious gift which could be bestowed on mankind. That the authors of such splendid benefits should be requited by martyrdom; that their reward should be to be dealt with as the vilest of criminals, is not, upon this theory, a deplorable error and misfortune, for which humanity should mourn in sackcloth and ashes, but the normal and justifiable state of things. The propounder of a new truth, according to this doctrine, should stand, as stood, in the legislation of the Locrians, the proposer of a new law, with a halter round his neck,

to be instantly tightened if the public assembly did not, on hearing his reasons, then and there adopt his proposition. People who defend this mode of treating benefactors, can not be supposed to set much value on the benefit; and I believe this view of the subject is mostly confined to the sort of persons who think that new truths may have been desirable once, but that we have had enough of them now.

But, indeed, the dictum that truth always triumphs over persecution, is one of those pleasant falsehoods which men repeat after one another till they pass into commonplaces, but which all experience refutes. History teems with instances of truth put down by persecution. If not suppressed forever, it may be thrown back for centuries. To speak only of religious opinions: the Reformation broke out at least twenty times before Luther, and was put down. Arnold of Brescia was put down. Fra Dolcino was put down. Savonarola was put down. The Albigeois were put down. The Vaudois were put down. The Lollards were put down. The Hussites were put down. Even after the era of Luther, wherever persecution was persisted in, it was successful. In Spain, Italy, Flanders, the Austrian empire, Protestantism was rooted out; and, most likely, would have been so in England, had Queen Mary lived, or Queen Elizabeth died. Persecution has always succeeded, save where the heretics were too strong a party to be effectually persecuted. No reasonable person can doubt that Christianity might have been extirpated in the Roman empire. It spread, and became predominant, because the persecutions were only occasional, lasting but a short time, and separated by long intervals of almost undisturbed propagandism. It is a piece of idle sentimentality that truth, merely as truth, has any inherent power denied to error, of prevailing against the dungeon and the stake. Men are not more zealous for truth than they often are for error, and a sufficient application of legal or even of social penalties will generally succeed in stopping the propagation of either. The real advantage which truth has, consists in this, that when an opinion is true, it may be extinguished once, twice, or many times, but in the course of ages there will generally be found persons to rediscover it, until some one of its reappearances falls on a time when from favourable circumstances it escapes persecution until it has made such head as to withstand all subsequent attempts to suppress it.

It will be said, that we do not now put to death the introducers of new opinions: we are not like our fathers who slew the prophets, we even build sepulchres to them. It is true we no longer put heretics to death; and the amount of penal infliction which modern feeling would probably tolerate, even against the most obnoxious opinions, is not sufficient to extirpate them. But let us not flatter ourselves that we are yet free from the stain even of legal persecution. Penalties for opinion, or at least for its expression, still exist by law; and their enforcement is not, even in these times, so unexampled as to make it at all incredible that they may some day be revived in full force. In the year 1857, at the summer assizes of the county of Cornwall, an unfortunate man,[2] said to be of unexceptionable conduct in all relations of life, was sentenced to twenty-one months imprisonment, for uttering, and writing on a gate, some offensive words concerning Christianity. Within a month of the same time, at the Old Bailey, two persons, on two separate occasions,[3] were rejected as jurymen, and one of them grossly insulted by the judge and one of the counsel, because they honestly declared that they had no theological belief; and a third, a foreigner,[4] for the same reason, was denied justice against a thief. This refusal of redress took place in virtue of the legal doctrine, that no person can be allowed to give evidence in a court of justice, who does not profess belief in a God (any god is sufficient) and in a future state; which is equivalent to declaring such persons to be outlaws, excluded from the protection of the tribunals; who may not only be robbed or assaulted with impunity, if no one but themselves, or persons of similar opinions, be present, but

any one else may be robbed or assaulted with impunity, if the proof of the fact depends on their evidence. The assumption on which this is grounded, is that the oath is worthless, of a person who does not believe in a future state; a proposition which betokens much ignorance of history in those who assent to it (since it is historically true that a large proportion of infidels in all ages have been persons of distinguished integrity and honor); and would be maintained by no one who had the smallest conception how many of the persons in greatest repute with the world, both for virtues and for attainments, are well known, at least to their intimates, to be unbelievers. The rule, besides, is suicidal, and cuts away its own foundation. Under pretence that atheists must be liars, it admits the testimony of all atheists who are willing to lie, and rejects only those who brave the obloquy of publicly confessing a detested creed rather than affirm a falsehood. A rule thus self-convicted of absurdity so far as regards its professed purpose, can be kept in force only as a badge of hatred, a relic of persecution; a persecution, too, having the peculiarity that the qualification for undergoing it is the being clearly proved not to deserve it. The rule, and the theory it implies, are hardly less insulting to believers than to infidels. For if he who does not believe in a future state necessarily lies, it follows that they who do believe are only prevented from lying, if prevented they are, by the fear of hell. We will not do the authors and abettors of the rule the injury of supposing, that the conception which they have formed of Christian virtue is drawn from their own consciousness.

These, indeed, are but rags and remnants of persecution, and may be thought to be not so much an indication of the wish to persecute, as an example of that very frequent infirmity of English minds, which makes them take a preposterous pleasure in the assertion of a bad principle, when they are no longer bad enough to desire to carry it really into practice. But unhappily there is no security in the state of the public mind, that the suspension of worse forms of legal persecution, which has lasted for about the space of a generation, will continue. In this age the quiet surface of routine is as often ruffled by attempts to resuscitate past evils, as to introduce new benefits. What is boasted of at the present time as the revival of religion, is always, in narrow and uncultivated minds, at least as much the revival of bigotry; and where there is the strongest permanent leaven of intolerance in the feelings of a people, which at all times abides in the middle classes of this country, it needs but little to provoke them into actively persecuting those whom they have never ceased to think proper objects of persecution.[5] For it is this -- it is the opinions men entertain, and the feelings they cherish, respecting those who disown the beliefs they deem important, which makes this country not a place of mental freedom. For a long time past, the chief mischief of the legal penalties is that they strengthen the social stigma. It is that stigma which is really effective, and so effective is it, that the profession of opinions which are under the ban of society is much less common in England, than is, in many other countries, the avowal of those which incur risk of judicial punishment. In respect to all persons but those whose pecuniary circumstances make them independent of the good will of other people, opinion, on this subject, is as efficacious as law; men might as well be imprisoned, as excluded from the means of earning their bread. Those whose bread is already secured, and who desire no favors from men in power, or from bodies of men, or from the public, have nothing to fear from the open avowal of any opinions, but to be ill-thought of and illspoken of, and this it ought not to require a very heroic mould to enable them to bear. There is no room for any appeal ad misericordiam in behalf of such persons. But though we do not now inflict so much evil on those who think differently from us, as it was formerly our custom to do, it may be that we do ourselves as much evil as ever by our treatment of them. Socrates was put to death, but the Socratic philosophy rose like the sun in heaven, and spread its illumination over the whole intellectual firmament. Christians were cast to the lions, but the Christian Church grew up a

stately and spreading tree, overtopping the older and less vigorous growths, and stifling them by its shade. Our merely social intolerance, kills no one, roots out no opinions, but induces men to disguise them, or to abstain from any active effort for their diffusion. With us, heretical opinions do not perceptibly gain or even lose, ground in each decade or generation; they never blaze out far and wide, but continue to smoulder in the narrow circles of thinking and studious persons among whom they originate, without ever lighting up the general affairs of mankind with either a true or a deceptive light. And thus is kept up a state of things very satisfactory to some minds, because, without the unpleasant process of fining or imprisoning anybody, it maintains all prevailing opinions outwardly undisturbed, while it does not absolutely interdict the exercise of reason by dissentients afflicted with the malady of thought. A convenient plan for having peace in the intellectual world, and keeping all things going on therein very much as they do already. But the price paid for this sort of intellectual pacification, is the sacrifice of the entire moral courage of the human mind. A state of things in which a large portion of the most active and inquiring intellects find it advisable to keep the genuine principles and grounds of their convictions within their own breasts, and attempt, in what they address to the public, to fit as much as they can of their own conclusions to premises which they have internally renounced, cannot send forth the open, fearless characters, and logical, consistent intellects who once adorned the thinking world. The sort of men who can be looked for under it, are either mere conformers to commonplace, or time-servers for truth whose arguments on all great subjects are meant for their hearers, and are not those which have convinced themselves. Those who avoid this alternative, do so by narrowing their thoughts and interests to things which can be spoken of without venturing within the region of principles, that is, to small practical matters, which would come right of themselves, if but the minds of mankind were strengthened and enlarged, and which will never be made effectually right until then; while that which would strengthen and enlarge men's minds, free and daring speculation on the highest subjects, is abandoned.

Those in whose eyes this reticence on the part of heretics is no evil, should consider in the first place, that in consequence of it there is never any fair and thorough discussion of heretical opinions; and that such of them as could not stand such a discussion, though they may be prevented from spreading, do not disappear. But it is not the minds of heretics that are deteriorated most, by the ban placed on all inquiry which does not end in the orthodox conclusions. The greatest harm done is to those who are not heretics, and whose whole mental development is cramped, and their reason cowed, by the fear of heresy. Who can compute what the world loses in the multitude of promising intellects combined with timid characters, who dare not follow out any bold, vigorous, independent train of thought, lest it should land them in something which would admit of being considered irreligious or immoral? Among them we may occasionally see some man of deep conscientiousness, and subtile and refined understanding, who spends a life in sophisticating with an intellect which he cannot silence, and exhausts the resources of ingenuity in attempting to reconcile the promptings of his conscience and reason with orthodoxy, which yet he does not, perhaps, to the end succeed in doing. No one can be a great thinker who does not recognize, that as a thinker it is his first duty to follow his intellect to whatever conclusions it may lead. Truth gains more even by the errors of one who, with due study and preparation, thinks for himself, than by the true opinions of those who only hold them because they do not suffer themselves to think. Not that it is solely, or chiefly, to form great thinkers, that freedom of thinking is required. On the contrary, it is as much, and even more indispensable, to enable average human beings to attain the mental stature which they are capable of. There have been, and may again be,

great individual thinkers, in a general atmosphere of mental slavery. But there never has been, nor ever will be, in that atmosphere, an intellectually active people. Where any people has made a temporary approach to such a character, it has been because the dread of heterodox speculation was for a time suspended. Where there is a tacit convention that principles are not to be disputed; where the discussion of the greatest questions which can occupy humanity is considered to be closed, we cannot hope to find that generally high scale of mental activity which has made some periods of history so remarkable. Never when controversy avoided the subjects which are large and important enough to kindle enthusiasm, was the mind of a people stirred up from its foundations, and the impulse given which raised even persons of the most ordinary intellect to something of the dignity of thinking beings. Of such we have had an example in the condition of Europe during the times immediately following the Reformation; another, though limited to the Continent and to a more cultivated class, in the speculative movement of the latter half of the eighteenth century; and a third, of still briefer duration, in the intellectual fermentation of Germany during the Goethian and Fichtean period. These periods differed widely in the particular opinions which they developed; but were alike in this, that during all three the yoke of authority was broken. In each, an old mental despotism had been thrown off, and no new one had yet taken its place. The impulse given at these three periods has made Europe what it now is. Every single improvement which has taken place either in the human mind or in institutions, may be traced distinctly to one or other of them. Appearances have for some time indicated that all three impulses are well-nigh spent; and we can expect no fresh start, until we again assert our mental freedom.

Let us now pass to the second division of the argument, and dismissing the Supposition that any of the received opinions may be false, let us assume them to be true, and examine into the worth of the manner in which they are likely to be held, when their truth is not freely and openly canvassed. However unwillingly a person who has a strong opinion may admit the possibility that his opinion may be false, he ought to be moved by the consideration that however true it may be, if it is not fully, frequently, and fearlessly discussed, it will be held as a dead dogma, not a living truth.

There is a class of persons (happily not quite so numerous as formerly) who think it enough if a person assents undoubtingly to what they think true, though he has no knowledge whatever of the grounds of the opinion, and could not make a tenable defence of it against the most superficial objections. Such persons, if they can once get their creed taught from authority, naturally think that no good, and some harm, comes of its being allowed to be questioned. Where their influence prevails, they make it nearly impossible for the received opinion to be rejected wisely and considerately, though it may still be rejected rashly and ignorantly; for to shut out discussion entirely is seldom possible, and when it once gets in, beliefs not grounded on conviction are apt to give way before the slightest semblance of an argument. Waiving, however, this possibility -- assuming that the true opinion abides in the mind, but abides as a prejudice, a belief independent of, and proof against, argument -- this is not the way in which truth ought to be held by a rational being. This is not knowing the truth. Truth, thus held, is but one superstition the more, accidentally clinging to the words which enunciate a truth.

If the intellect and judgment of mankind ought to be cultivated, a thing which Protestants at least do not deny, on what can these faculties be more appropriately exercised by any one, than on the things which concern him so much that it is considered necessary for him to hold opinions on them? If the cultivation of the understanding consists in one thing more than in another, it is surely in learning the grounds of one's own opinions. Whatever people believe, on subjects on which it is

of the first importance to believe rightly, they ought to be able to defend against at least the common objections. But, some one may say, "Let them be taught the grounds of their opinions. It does not follow that opinions must be merely parroted because they are never heard controverted. Persons who learn geometry do not simply commit the theorems to memory, but understand and learn likewise the demonstrations; and it would be absurd to say that they remain ignorant of the grounds of geometrical truths, because they never hear any one deny, and attempt to disprove them." Undoubtedly: and such teaching suffices on a subject like mathematics, where there is nothing at all to be said on the wrong side of the question. The peculiarity of the evidence of mathematical truths is, that all the argument is on one side. There are no objections, and no answers to objections. But on every subject on which difference of opinion is possible, the truth depends on a balance to be struck between two sets of conflicting reasons. Even in natural philosophy, there is always some other explanation possible of the same facts; some geocentric theory instead of heliocentric, some phlogiston instead of oxygen; and it has to be shown why that other theory cannot be the true one: and until this is shown and until we know how it is shown, we do not understand the grounds of our opinion. But when we turn to subjects infinitely more complicated, to morals, religion, politics, social relations, and the business of life, three-fourths of the arguments for every disputed opinion consist in dispelling the appearances which favor some opinion different from it. The greatest orator, save one, of antiquity, has left it on record that he always studied his adversary's case with as great, if not with still greater, intensity than even his own. What Cicero practised as the means of forensic success, requires to be imitated by all who study any subject in order to arrive at the truth. He who knows only his own side of the case, knows little of that. His reasons may be good, and no one may have been able to refute them. But if he is equally unable to refute the reasons on the opposite side; if he does not so much as know what they are, he has no ground for preferring either opinion. The rational position for him would be suspension of judgment, and unless he contents himself with that, he is either led by authority, or adopts, like the generality of the world, the side to which he feels most inclination. Nor is it enough that he should hear the arguments of adversaries from his own teachers, presented as they state them, and accompanied by what they offer as refutations. This is not the way to do justice to the arguments, or bring them into real contact with his own mind. He must be able to hear them from persons who actually believe them; who defend them in earnest, and do their very utmost for them. He must know them in their most plausible and persuasive form; he must feel the whole force of the difficulty which the true view of the subject has to encounter and dispose of, else he will never really possess himself of the portion of truth which meets and removes that difficulty. Ninety-nine in a hundred of what are called educated men are in this condition, even of those who can argue fluently for their opinions. Their conclusion may be true, but it might be false for anything they know: they have never thrown themselves into the mental position of those who think differently from them, and considered what such persons may have to say; and consequently they do not, in any proper sense of the word, know the doctrine which they themselves profess. They do not know those parts of it which explain and justify the remainder; the considerations which show that a fact which seemingly conflicts with another is reconcilable with it, or that, of two apparently strong reasons, one and not the other ought to be preferred. All that part of the truth which turns the scale, and decides the judgment of a completely informed mind, they are strangers to; nor is it ever really known, but to those who have attended equally and impartially to both sides, and endeavored to see the reasons of both in the strongest light. So essential is this discipline to a real understanding of moral and human subjects, that if opponents of all important truths do not exist, it is indispensable to imagine them and supply them with the strongest arguments which the most

skilful devil's advocate can conjure up.

To abate the force of these considerations, an enemy of free discussion may be supposed to say, that there is no necessity for mankind in general to know and understand all that can be said against or for their opinions by philosophers and theologians. That it is not needful for common men to be able to expose all the misstatements or fallacies of an ingenious opponent. That it is enough if there is always somebody capable of answering them, so that nothing likely to mislead uninstructed persons remains unrefuted. That simple minds, having been taught the obvious grounds of the truths inculcated on them, may trust to authority for the rest, and being aware that they have neither knowledge nor talent to resolve every difficulty which can be raised, may repose in the assurance that all those which have been raised have been or can be answered, by those who are specially trained to the task.

Conceding to this view of the subject the utmost that can be claimed for it by those most easily satisfied with the amount of understanding of truth which ought to accompany the belief of it; even so, the argument for free discussion is no way weakened. For even this doctrine acknowledges that mankind ought to have a rational assurance that all objections have been satisfactorily answered; and how are they to be answered if that which requires to be answered is not spoken? or how can the answer be known to be satisfactory, if the objectors have no opportunity of showing that it is unsatisfactory? If not the public, at least the philosophers and theologians who are to resolve the difficulties, must make themselves familiar with those difficulties in their most puzzling form; and this cannot be accomplished unless they are freely stated, and placed in the most advantageous light which they admit of. The Catholic Church has its own way of dealing with this embarrassing problem. It makes a broad separation between those who can be permitted to receive its doctrines on conviction, and those who must accept them on trust. Neither, indeed, are allowed any choice as to what they will accept; but the clergy, such at least as can be fully confided in, may admissibly and meritoriously make themselves acquainted with the arguments of opponents, in order to answer them, and may, therefore, read heretical books; the laity, not unless by special permission, hard to be obtained. This discipline recognizes a knowledge of the enemy's case as beneficial to the teachers, but finds means, consistent with this, of denying it to the rest of the world: thus giving to the elite more mental culture, though not more mental freedom, than it allows to the mass. By this device it succeeds in obtaining the kind of mental superiority which its purposes require; for though culture without freedom never made a large and liberal mind, it can make a clever nisi prius advocate of a cause. But in countries professing Protestantism, this resource is denied; since Protestants hold, at least in theory, that the responsibility for the choice of a religion must be borne by each for himself, and cannot be thrown off upon teachers. Besides, in the present state of the world, it is practically impossible that writings which are read by the instructed can be kept from the uninstructed. If the teachers of mankind are to be cognizant of all that they ought to know, everything must be free to be written and published without restraint.

If, however, the mischievous operation of the absence of free discussion, when the received opinions are true, were confined to leaving men ignorant of the grounds of those opinions, it might be thought that this, if an intellectual, is no moral evil, and does not affect the worth of the opinions, regarded in their influence on the character. The fact, however, is, that not only the grounds of the opinion are forgotten in the absence of discussion, but too often the meaning of the opinion itself. The words which convey it, cease to suggest ideas, or suggest only a small portion of those they were originally employed to communicate. Instead of a vivid conception and a living belief, there remain only a few phrases retained by rote; or, if any part, the shell and husk only of

the meaning is retained, the finer essence being lost. The great chapter in human history which this fact occupies and fills, cannot be too earnestly studied and meditated on.

It is illustrated in the experience of almost all ethical doctrines and religious creeds. They are all full of meaning and vitality to those who originate them, and to the direct disciples of the originators. Their meaning continues to be felt in undiminished strength, and is perhaps brought out into even fuller consciousness, so long as the struggle lasts to give the doctrine or creed an ascendency over other creeds. At last it either prevails, and becomes the general opinion, or its progress stops; it keeps possession of the ground it has gained, but ceases to spread further. When either of these results has become apparent, controversy on the subject flags, and gradually dies away. The doctrine has taken its place, if not as a received opinion, as one of the admitted sects or divisions of opinion: those who hold it have generally inherited, not adopted it; and conversion from one of these doctrines to another, being now an exceptional fact, occupies little place in the thoughts of their professors. Instead of being, as at first, constantly on the alert either to defend themselves against the world, or to bring the world over to them, they have subsided into acquiescence, and neither listen, when they can help it, to arguments against their creed, nor trouble dissentients (if there be such) with arguments in its favor. From this time may usually be dated the decline in the living power of the doctrine. We often hear the teachers of all creeds lamenting the difficulty of keeping up in the minds of believers a lively apprehension of the truth which they nominally recognize, so that it may penetrate the feelings, and acquire a real mastery over the conduct. No such difficulty is complained of while the creed is still fighting for its existence: even the weaker combatants then know and feel what they are fighting for, and the difference between it and other doctrines; and in that period of every creed's existence, not a few persons may be found, who have realized its fundamental principles in all the forms of thought, have weighed and considered them in all their important bearings, and have experienced the full effect on the character, which belief in that creed ought to produce in a mind thoroughly imbued with it. But when it has come to be an hereditary creed, and to be received passively, not actively -- when the mind is no longer compelled, in the same degree as at first, to exercise its vital powers on the questions which its belief presents to it, there is a progressive tendency to forget all of the belief except the formularies, or to give it a dull and torpid assent, as if accepting it on trust dispensed with the necessity of realizing it in consciousness, or testing it by personal experience; until it almost ceases to connect itself at all with the inner life of the human being. Then are seen the cases, so frequent in this age of the world as almost to form the majority, in which the creed remains as it were outside the mind, encrusting and petrifying it against all other influences addressed to the higher parts of our nature; manifesting its power by not suffering any fresh and living conviction to get in, but itself doing nothing for the mind or heart, except standing sentinel over them to keep them vacant.

To what an extent doctrines intrinsically fitted to make the deepest impression upon the mind may remain in it as dead beliefs, without being ever realized in the imagination, the feelings, or the understanding, is exemplified by the manner in which the majority of believers hold the doctrines of Christianity. By Christianity I here mean what is accounted such by all churches and sects -- the maxims and precepts contained in the New Testament. These are considered sacred, and accepted as laws, by all professing Christians. Yet it is scarcely too much to say that not one Christian in a thousand guides or tests his individual conduct by reference to those laws. The standard to which he does refer it, is the custom of his nation, his class, or his religious profession. He has thus, on the one hand, a collection of ethical maxims, which he believes to have been vouchsafed to him by

infallible wisdom as rules for his government; and on the other, a set of every-day judgments and practices, which go a certain length with some of those maxims, not so great a length with others, stand in direct opposition to some, and are, on the whole, a compromise between the Christian creed and the interests and suggestions of worldly life. To the first of these standards he gives his homage; to the other his real allegiance. All Christians believe that the blessed are the poor and humble, and those who are illused by the world; that it is easier for a camel to pass through the eye of a needle than for a rich man to enter the kingdom of heaven; that they should judge not, lest they be judged; that they should swear not at all; that they should love their neighbor as themselves; that if one take their cloak, they should give him their coat also; that they should take no thought for the morrow; that if they would be perfect, they should sell all that they have and give it to the poor. They are not insincere when they say that they believe these things. They do believe them, as people believe what they have always heard lauded and never discussed. But in the sense of that living belief which regulates conduct, they believe these doctrines just up to the point to which it is usual to act upon them. The doctrines in their integrity are serviceable to pelt adversaries with; and it is understood that they are to be put forward (when possible) as the reasons for whatever people do that they think laudable. But any one who reminded them that the maxims require an infinity of things which they never even think of doing would gain nothing but to be classed among those very unpopular characters who affect to be better than other people. The doctrines have no hold on ordinary believers -- are not a power in their minds. They have an habitual respect for the sound of them, but no feeling which spreads from the words to the things signified, and forces the mind to take them in, and make them conform to the formula. Whenever conduct is concerned, they look round for Mr. A and B to direct them how far to go in obeying Christ.

Now we may be well assured that the case was not thus, but far otherwise, with the early Christians. Had it been thus, Christianity never would have expanded from an obscure sect of the despised Hebrews into the religion of the Roman empire. When their enemies said, "See how these Christians love one another" (a remark not likely to be made by anybody now), they assuredly had a much livelier feeling of the meaning of their creed than they have ever had since. And to this cause, probably, it is chiefly owing that Christianity now makes so little progress in extending its domain, and after eighteen centuries, is still nearly confined to Europeans and the descendants of Europeans. Even with the strictly religious, who are much in earnest about their doctrines, and attach a greater amount of meaning to many of them than people in general, it commonly happens that the part which is thus comparatively active in their minds is that which was made by Calvin, or Knox, or some such person much nearer in character to themselves. The sayings of Christ coexist passively in their minds, producing hardly any effect beyond what is caused by mere listening to words so amiable and bland. There are many reasons, doubtless, why doctrines which are the badge of a sect retain more of their vitality than those common to all recognized sects, and why more pains are taken by teachers to keep their meaning alive; but one reason certainly is, that the peculiar doctrines are more questioned, and have to be oftener defended against open gainsayers. Both teachers and learners go to sleep at their post, as soon as there is no enemy in the field.

The same thing holds true, generally speaking, of all traditional doctrines -- those of prudence and knowledge of life, as well as of morals or religion. All languages and literatures are full of general observations on life, both as to what it is, and how to conduct oneself in it; observations which everybody knows, which everybody repeats, or hears with acquiescence, which are received as

truisms, yet of which most people first truly learn the meaning, when experience, generally of a painful kind, has made it a reality to them. How often, when smarting under some unforeseen misfortune or disappointment, does a person call to mind some proverb or common saying familiar to him all his life, the meaning of which, if he had ever before felt it as he does now, would have saved him from the calamity. There are indeed reasons for this, other than the absence of discussion: there are many truths of which the full meaning cannot be realized, until personal experience has brought it home. But much more of the meaning even of these would have been understood, and what was understood would have been far more deeply impressed on the mind, if the man had been accustomed to hear it argued pro and con by people who did understand it. The fatal tendency of mankind to leave off thinking about a thing when it is no longer doubtful, is the cause of half their errors. A contemporary author has well spoken of "the deep slumber of a decided opinion."

But what! (it may be asked) Is the absence of unanimity an indispensable condition of true knowledge? Is it necessary that some part of mankind should persist in error, to enable any to realize the truth? Does a belief cease to be real and vital as soon as it is generally received -- and is a proposition never thoroughly understood and felt unless some doubt of it remains? As soon as mankind have unanimously accepted a truth, does the truth perish within them? The highest aim and best result of improved intelligence, it has hitherto been thought, is to unite mankind more and more in the acknowledgment of all important truths: and does the intelligence only last as long as it has not achieved its object? Do the fruits of conquest perish by the very completeness of the victory?

I affirm no such thing. As mankind improve, the number of doctrines which are no longer disputed or doubted will be constantly on the increase: and the well-being of mankind may almost be measured by the number and gravity of the truths which have reached the point of being uncontested. The cessation, on one question after another, of serious controversy, is one of the necessary incidents of the consolidation of opinion; a consolidation as salutary in the case of true opinions, as it is dangerous and noxious when the opinions are erroneous. But though this gradual narrowing of the bounds of diversity of opinion is necessary in both senses of the term, being at once inevitable and indispensable, we are not therefore obliged to conclude that all its consequences must be beneficial. The loss of so important an aid to the intelligent and living apprehension of a truth, as is afforded by the necessity of explaining it to, or defending it against, opponents, though not sufficient to outweigh, is no trifling drawback from, the benefit of its universal recognition. Where this advantage can no longer be had, I confess I should like to see the teachers of mankind endeavoring to provide a substitute for it; some contrivance for making the difficulties of the question as present to the learner's consciousness, as if they were pressed upon him by a dissentient champion, eager for his conversion.

But instead of seeking contrivances for this purpose, they have lost those they formerly had. The Socratic dialectics, so magnificently exemplified in the dialogues of Plato, were a contrivance of this description. They were essentially a negative discussion of the great questions of philosophy and life, directed with consummate skill to the purpose of convincing any one who had merely adopted the commonplaces of received opinion, that he did not understand the subject -- that he as yet attached no definite meaning to the doctrines he professed; in order that, becoming aware of his ignorance, he might be put in the way to attain a stable belief, resting on a clear apprehension both of the meaning of doctrines and of their evidence. The school disputations of the Middle Ages had a somewhat similar object. They were intended to make sure that the pupil understood his own

opinion, and (by necessary correlation) the opinion opposed to it, and could enforce the grounds of the one and confute those of the other. These last-mentioned contests had indeed the incurable defect, that the premises appealed to were taken from authority, not from reason; and, as a discipline to the mind, they were in every respect inferior to the powerful dialectics which formed the intellects of the "Socratici viri:" but the modern mind owes far more to both than it is generally willing to admit, and the present modes of education contain nothing which in the smallest degree supplies the place either of the one or of the other. A person who derives all his instruction from teachers or books, even if he escape the besetting temptation of contenting himself with cram, is under no compulsion to hear both sides; accordingly it is far from a frequent accomplishment, even among thinkers, to know both sides; and the weakest part of what everybody says in defence of his opinion, is what he intends as a reply to antagonists. It is the fashion of the present time to disparage negative logic -- that which points out weaknesses in theory or errors in practice, without establishing positive truths. Such negative criticism would indeed be poor enough as an ultimate result; but as a means to attaining any positive knowledge or conviction worthy the name, it cannot be valued too highly; and until people are again systematically trained to it, there will be few great thinkers, and a low general average of intellect, in any but the mathematical and physical departments of speculation. On any other subject no one's opinions deserve the name of knowledge, except so far as he has either had forced upon him by others, or gone through of himself, the same mental process which would have been required of him in carrying on an active controversy with opponents. That, therefore, which when absent, it is so indispensable, but so difficult, to create, how worse than absurd is it to forego, when spontaneously offering itself! If there are any persons who contest a received opinion, or who will do so if law or opinion will let them, let us thank them for it, open our minds to listen to them, and rejoice that there is some one to do for us what we otherwise ought, if we have any regard for either the certainty or the vitality of our convictions, to do with much greater labor for ourselves.

It still remains to speak of one of the principal causes which make diversity of opinion advantageous, and will continue to do so until mankind shall have entered a stage of intellectual advancement which at present seems at an incalculable distance. We have hitherto considered only two possibilities: that the received opinion may be false, and some other opinion, consequently, true; or that, the received opinion being true, a conflict with the opposite error is essential to a clear apprehension and deep feeling of its truth. But there is a commoner case than either of these; when the conflicting doctrines, instead of being one true and the other false, share the truth between them; and the nonconforming opinion is needed to supply the remainder of the truth, of which the received doctrine embodies only a part. Popular opinions, on subjects not palpable to sense, are often true, but seldom or never the whole truth. They are a part of the truth; sometimes a greater, sometimes a smaller part, but exaggerated, distorted, and disjoined from the truths by which they ought to be accompanied and limited. Heretical opinions, on the other hand, are generally some of these suppressed and neglected truths, bursting the bonds which kept them down, and either seeking reconciliation with the truth contained in the common opinion, or fronting it as enemies, and setting themselves up, with similar exclusiveness, as the whole truth. The latter case is hitherto the most frequent, as, in the human mind, one-sidedness has always been the rule, and many-sidedness the exception. Hence, even in revolutions of opinion, one part of the truth usually sets while another rises. Even progress, which ought to superadd, for the most part only substitutes one partial and incomplete truth for another; improvement consisting chiefly in this, that the new fragment of truth is more wanted, more adapted to the needs of the time, than

that which it displaces. Such being the partial character of prevailing opinions, even when resting on a true foundation; every opinion which embodies somewhat of the portion of truth which the common opinion omits, ought to be considered precious, with whatever amount of error and confusion that truth may be blended. No sober judge of human affairs will feel bound to be indignant because those who force on our notice truths which we should otherwise have overlooked, overlook some of those which we see. Rather, he will think that so long as popular truth is one-sided, it is more desirable than otherwise that unpopular truth should have one-sided asserters too; such being usually the most energetic, and the most likely to compel reluctant attention to the fragment of wisdom which they proclaim as if it were the whole.

Thus, in the eighteenth century, when nearly all the instructed, and all those of the uninstructed who were led by them, were lost in admiration of what is called civilization, and of the marvels of modern science, literature, and philosophy, and while greatly overrating the amount of unlikeness between the men of modern and those of ancient times, indulged the belief that the whole of the difference was in their own favor; with what a salutary shock did the paradoxes of Rousseau explode like bombshells in the midst, dislocating the compact mass of one-sided opinion, and forcing its elements to recombine in a better form and with additional ingredients. Not that the current opinions were on the whole farther from the truth than Rousseau's were; on the contrary, they were nearer to it; they contained more of positive truth, and very much less of error. Nevertheless there lay in Rousseau's doctrine, and has floated down the stream of opinion along with it, a considerable amount of exactly those truths which the popular opinion wanted; and these are the deposit which was left behind when the flood subsided. The superior worth of simplicity of life, the enervating and demoralizing effect of the trammels and hypocrisies of artificial society, are ideas which have never been entirely absent from cultivated minds since Rousseau wrote; and they will in time produce their due effect, though at present needing to be asserted as much as ever, and to be asserted by deeds, for words, on this subject, have nearly exhausted their power.

In politics, again, it is almost a commonplace, that a party of order or stability, and a party of progress or reform, are both necessary elements of a healthy state of political life; until the one or the other shall have so enlarged its mental grasp as to be a party equally of order and of progress, knowing and distinguishing what is fit to be preserved from what ought to be swept away. Each of these modes of thinking derives its utility from the deficiencies of the other; but it is in a great measure the opposition of the other that keeps each within the limits of reason and sanity. Unless opinions favorable to democracy and to aristocracy, to property and to equality, to co-operation and to competition, to luxury and to abstinence, to sociality and individuality, to liberty and discipline, and all the other standing antagonisms of practical life, are expressed with equal freedom, and enforced and defended with equal talent and energy, there is no chance of both elements obtaining their due; one scale is sure to go up, and the other down. Truth, in the great practical concerns of life, is so much a question of the reconciling and combining of opposites, that very few have minds sufficiently capacious and impartial to make the adjustment with an approach to correctness, and it has to be made by the rough process of a struggle between combatants fighting under hostile banners. On any of the great open questions just enumerated, if either of the two opinions has a better claim than the other, not merely to be tolerated, but to be encouraged and countenanced, it is the one which happens at the particular time and place to be in a minority. That is the opinion which, for the time being, represents the neglected interests, the side of human well-being which is in danger of obtaining less than its share. I am aware that there is not, in this country, any intolerance of differences of opinion on most of these topics. They are

adduced to show, by admitted and multiplied examples, the universality of the fact, that only through diversity of opinion is there, in the existing state of human intellect, a chance of fair play to all sides of the truth. When there are persons to be found, who form an exception to the apparent unanimity of the world on any subject, even if the world is in the right, it is always probable that dissentients have something worth hearing to say for themselves, and that truth would lose something by their silence.

It may be objected, "But some received principles, especially on the highest and most vital subjects, are more than half-truths. The Christian morality, for instance, is the whole truth on that subject and if any one teaches a morality which varies from it, he is wholly in error." As this is of all cases the most important in practice, none can be fitter to test the general maxim. But before pronouncing what Christian morality is or is not, it would be desirable to decide what is meant by Christian morality. If it means the morality of the New Testament, I wonder that any one who derives his knowledge of this from the book itself, can suppose that it was announced, or intended, as a complete doctrine of morals. The Gospel always refers to a preexisting morality, and confines its precepts to the particulars in which that morality was to be corrected, or superseded by a wider and higher; expressing itself, moreover, in terms most general, often impossible to be interpreted literally, and possessing rather the impressiveness of poetry or eloquence than the precision of legislation. To extract from it a body of ethical doctrine, has never been possible without eking it out from the Old Testament, that is, from a system elaborate indeed, but in many respects barbarous, and intended only for a barbarous people. St. Paul, a declared enemy to this Judaical mode of interpreting the doctrine and filling up the scheme of his Master, equally assumes a preexisting morality, namely, that of the Greeks and Romans; and his advice to Christians is in a great measure a system of accommodation to that; even to the extent of giving an apparent sanction to slavery. What is called Christian, but should rather be termed theological, morality, was not the work of Christ or the Apostles, but is of much later origin, having been gradually built up by the Catholic Church of the first five centuries, and though not implicitly adopted by moderns and Protestants, has been much less modified by them than might have been expected. For the most part, indeed, they have contented themselves with cutting off the additions which had been made to it in the Middle Ages, each sect supplying the place by fresh additions, adapted to its own character and tendencies. That mankind owe a great debt to this morality, and to its early teachers, I should be the last person to deny; but I do not scruple to say of it, that it is, in many important points, incomplete and one-sided, and that unless ideas and feelings, not sanctioned by it, had contributed to the formation of European life and character, human affairs would have been in a worse condition than they now are. Christian morality (so called) has all the characters of a reaction; it is, in great part, a protest against Paganism. Its ideal is negative rather than positive; passive rather than active; Innocence rather than Nobleness; Abstinence from Evil, rather than energetic Pursuit of Good: in its precepts (as has been well said) "thou shalt not" predominates unduly over "thou shalt." In its horror of sensuality, it made an idol of asceticism, which has been gradually compromised away into one of legality. It holds out the hope of heaven and the threat of hell, as the appointed and appropriate motives to a virtuous life: in this falling far below the best of the ancients, and doing what lies in it to give to human morality an essentially selfish character, by disconnecting each man's feelings of duty from the interests of his fellow-creatures, except so far as a self-interested inducement is offered to him for consulting them. It is essentially a doctrine of passive obedience; it inculcates submission to all authorities found established; who indeed are not to be actively obeyed when they command what religion forbids, but who are not to be resisted, far

less rebelled against, for any amount of wrong to ourselves. And while, in the morality of the best Pagan nations, duty to the State holds even a disproportionate place, infringing on the just liberty of the individual; in purely Christian ethics that grand department of duty is scarcely noticed or acknowledged. It is in the Koran, not the New Testament, that we read the maxim -- "A ruler who appoints any man to an office, when there is in his dominions another man better qualified for it, sins against God and against the State." What little recognition the idea of obligation to the public obtains in modern morality, is derived from Greek and Roman sources, not from Christian; as, even in the morality of private life, whatever exists of magnanimity, high-mindedness, personal dignity, even the sense of honor, is derived from the purely human, not the religious part of our education, and never could have grown out of a standard of ethics in which the only worth, professedly recognized, is that of obedience.

I am as far as any one from pretending that these defects are necessarily inherent in the Christian ethics, in every manner in which it can be conceived, or that the many requisites of a complete moral doctrine which it does not contain, do not admit of being reconciled with it. Far less would I insinuate this of the doctrines and precepts of Christ himself. I believe that the sayings of Christ are all, that I can see any evidence of their having been intended to be; that they are irreconcilable with nothing which a comprehensive morality requires; that everything which is excellent in ethics may be brought within them, with no greater violence to their language than has been done to it by all who have attempted to deduce from them any practical system of conduct whatever. But it is quite consistent with this, to believe that they contain and were meant to contain, only a part of the truth; that many essential elements of the highest morality are among the things which are not provided for, nor intended to be provided for, in the recorded deliverances of the Founder of Christianity, and which have been entirely thrown aside in the system of ethics erected on the basis of those deliverances by the Christian Church. And this being so, I think it a great error to persist in attempting to find in the Christian doctrine that complete rule for our guidance, which its author intended it to sanction and enforce, but only partially to provide. I believe, too, that this narrow theory is becoming a grave practical evil, detracting greatly from the value of the moral training and instruction, which so many wellmeaning persons are now at length exerting themselves to promote. I much fear that by attempting to form the mind and feelings on an exclusively religious type, and discarding those secular standards (as for want of a better name they may be called) which heretofore coexisted with and supplemented the Christian ethics, receiving some of its spirit, and infusing into it some of theirs, there will result, and is even now resulting, a low, abject, servile type of character, which, submit itself as it may to what it deems the Supreme Will, is incapable of rising to or sympathizing in the conception of Supreme Goodness. I believe that other ethics than any one which can be evolved from exclusively Christian sources, must exist side by side with Christian ethics to produce the moral regeneration of mankind; and that the Christian system is no exception to the rule that in an imperfect state of the human mind, the interests of truth require a diversity of opinions. It is not necessary that in ceasing to ignore the moral truths not contained in Christianity, men should ignore any of those which it does contain. Such prejudice, or oversight, when it occurs, is altogether an evil; but it is one from which we cannot hope to be always exempt, and must be regarded as the price paid for an inestimable good. The exclusive pretension made by a part of the truth to be the whole, must and ought to be protested against, and if a reactionary impulse should make the protestors unjust in their turn, this one-sidedness, like the other, may be lamented, but must be tolerated. If Christians would teach infidels to be just to Christianity, they should themselves be just to infidelity. It can do truth no

service to blink the fact, known to all who have the most ordinary acquaintance with literary history, that a large portion of the noblest and most valuable moral teaching has been the work, not only of men who did not know, but of men who knew and rejected, the Christian faith.

I do not pretend that the most unlimited use of the freedom of enunciating all possible opinions would put an end to the evils of religious or philosophical sectarianism. Every truth which men of narrow capacity are in earnest about, is sure to be asserted, inculcated, and in many ways even acted on, as if no other truth existed in the world, or at all events none that could limit or qualify the first. I acknowledge that the tendency of all opinions to become sectarian is not cured by the freest discussion, but is often heightened and exacerbated thereby; the truth which ought to have been, but was not, seen, being rejected all the more violently because proclaimed by persons regarded as opponents. But it is not on the impassioned partisan, it is on the calmer and more disinterested bystander, that this collision of opinions works its salutary effect. Not the violent conflict between parts of the truth, but the quiet suppression of half of it, is the formidable evil: there is always hope when people are forced to listen to both sides; it is when they attend only to one that errors harden into prejudices, and truth itself ceases to have the effect of truth, by being exaggerated into falsehood. And since there are few mental attributes more rare than that judicial faculty which can sit in intelligent judgment between two sides of a question, of which only one is represented by an advocate before it, truth has no chance but in proportion as every side of it, every opinion which embodies any fraction of the truth, not only finds advocates, but is so advocated as to be listened to.

We have now recognized the necessity to the mental wellbeing of mankind (on which all their other well-being depends) of freedom of opinion, and freedom of the expression of opinion, on four distinct grounds; which we will now briefly recapitulate.

First, if any opinion is compelled to silence, that opinion may, for aught we can certainly know, be true. To deny this is to assume our own infallibility.

Secondly, though the silenced opinion be an error, it may, and very commonly does, contain a portion of truth; and since the general or prevailing opinion on any object is rarely or never the whole truth, it is only by the collision of adverse opinions that the remainder of the truth has any chance of being supplied.

Thirdly, even if the received opinion be not only true, but the whole truth; unless it is suffered to be, and actually is, vigorously and earnestly contested, it will, by most of those who receive it, be held in the manner of a prejudice, with little comprehension or feeling of its rational grounds. And not only this, but, fourthly, the meaning of the doctrine itself will be in danger of being lost, or enfeebled, and deprived of its vital effect on the character and conduct: the dogma becoming a mere formal profession, inefficacious for good, but cumbering the ground, and preventing the growth of any real and heartfelt conviction, from reason or personal experience.

Before quitting the subject of freedom of opinion, it is fit to take notice of those who say, that the free expression of all opinions should be permitted, on condition that the manner be temperate, and do not pass the bounds of fair discussion. Much might be said on the impossibility of fixing where these supposed bounds are to be placed; for if the test be offence to those whose opinion is attacked, I think experience testifies that this offence is given whenever the attack is telling and powerful, and that every opponent who pushes them hard, and whom they find it difficult to answer, appears to them, if he shows any strong feeling on the subject, an intemperate opponent. But this, though an important consideration in a practical point of view, merges in a more

fundamental objection. Undoubtedly the manner of asserting an opinion, even though it be a true one, may be very objectionable, and may justly incur severe censure. But the principal offences of the kind are such as it is mostly impossible, unless by accidental self-betrayal, to bring home to conviction. The gravest of them is, to argue sophistically, to suppress facts or arguments, to misstate the elements of the case, or misrepresent the opposite opinion. But all this, even to the most aggravated degree, is so continually done in perfect good faith, by persons who are not considered, and in many other respects may not deserve to be considered, ignorant or incompetent, that it is rarely possible on adequate grounds conscientiously to stamp the misrepresentation as morally culpable; and still less could law presume to interfere with this kind of controversial misconduct. With regard to what is commonly meant by intemperate discussion, namely, invective, sarcasm, personality, and the like, the denunciation of these weapons would deserve more sympathy if it were ever proposed to interdict them equally to both sides; but it is only desired to restrain the employment of them against the prevailing opinion: against the unprevailing they may not only be used without general disapproval, but will be likely to obtain for him who uses them the praise of honest zeal and righteous indignation. Yet whatever mischief arises from their use, is greatest when they are employed against the comparatively defenceless; and whatever unfair advantage can be derived by any opinion from this mode of asserting it, accrues almost exclusively to received opinions. The worst offence of this kind which can be committed by a polemic, is to stigmatize those who hold the contrary opinion as bad and immoral men. To calumny of this sort, those who hold any unpopular opinion are peculiarly exposed, because they are in general few and uninfluential, and nobody but themselves feels much interest in seeing justice done them; but this weapon is, from the nature of the case, denied to those who attack a prevailing opinion: they can neither use it with safety to themselves, nor if they could, would it do anything but recoil on their own cause. In general, opinions contrary to those commonly received can only obtain a hearing by studied moderation of language, and the most cautious avoidance of unnecessary offence, from which they hardly ever deviate even in a slight degree without losing ground: while unmeasured vituperation employed on the side of the prevailing opinion, really does deter people from professing contrary opinions, and from listening to those who profess them. For the interest, therefore, of truth and justice, it is far more important to restrain this employment of vituperative language than the other; and, for example, if it were necessary to choose, there would be much more need to discourage offensive attacks on infidelity, than on religion. It is, however, obvious that law and authority have no business with restraining either, while opinion ought, in every instance, to determine its verdict by the circumstances of the individual case; condemning every one, on whichever side of the argument he places himself, in whose mode of advocacy either want of candor, or malignity, bigotry or intolerance of feeling manifest themselves, but not inferring these vices from the side which a person takes, though it be the contrary side of the question to our own; and giving merited honor to every one, whatever opinion he may hold, who has calmness to see and honesty to state what his opponents and their opinions really are, exaggerating nothing to their discredit, keeping nothing back which tells, or can be supposed to tell, in their favor. This is the real morality of public discussion; and if often violated, I am happy to think that there are many controversialists who to a great extent observe it, and a still greater number who conscientiously strive towards it.

[1] These words had scarcely been written, when, as if to give them an emphatic contradiction, occurred the Government Press Prosecutions of 1858. That illjudged interference with the liberty of public discussion has not, however, induced me to alter a single word in the text, nor has it at all

weakened my conviction that, moments of panic excepted, the era of pains and penalties far political discussion has, in our own country, passed away. For, in the first place, the prosecutions were not persisted in; and in the second, they were never, properly speaking, political prosecutions. The offence charged was not that of criticizing institutions, or the acts or persons of rulers, but of circulating what was deemed an immoral doctrine, the lawfulness of Tyrannicide.

If the arguments of the present chapter are of any validity, there ought to exist the fullest liberty of professing and discussing, as a matter of ethical conviction, any doctrine, however immoral it may be considered. It would, therefore, be irrelevant and out of place to examine here, whether the doctrine of Tyrannicide deserves that title. I shall content myself with saying, that the subject has been at all times one of the open questions of morals, that the act of a private citizen in striking down a criminal, who, by raising himself above the law, has placed himself beyond the reach of legal punishment or control, has been accounted by whole nations, and by some of the best and wisest of men, not a crime, but an act of exalted virtue and that, right or wrong, it is not of the nature of assassination but of civil war. As such, I hold that the instigation to it, in a specific case, may be a proper subject of punishment, but only if an overt act has followed, and at least a probable connection can be established between the act and the instigation. Even then it is not a foreign government, but the very government assailed, which alone, in the exercise of self-defence, can legitimately punish attacks directed against its own existence.

[4] Baron de Gleichen, Marlborough Street Police Court, August 4, 1857.

[5] Ample warning may be drawn from the large infusion of the passions of a persecutor, which mingled with the general display of the worst parts of our national character on the occasion of the Sepoy insurrection. The ravings of fanatics or charlatans from the pulpit may be unworthy of notice; but the heads of the Evangelical party have announced as their principle, for the government of Hindoos and Mahomedans, that no schools be supported by public money in which the Bible is not taught, and by necessary consequence that no public employment be given to any but real or pretended Christians. An Under-Secretary of State, in a speech delivered to his constituents on the 12th of November, 1857, is reported to have said: "Toleration of their faith" (the faith of a hundred millions of British subjects), "the superstition which they called religion, by the British Government, had had the effect of retarding the ascendency of the British name, and preventing the salutary growth of Christianity.... Toleration was the great corner-stone of the religious liberties of this country; but do not let them abuse that precious word toleration. As he understood it, it meant the complete liberty to all, freedom of worship, among Christians, who worshipped upon the same foundation. It meant toleration of all sects and denominations of Christians who believed in the one mediation." I desire to call attention to the fact, that a man who has been deemed fit to fill a high office in the government of this country, under a liberal Ministry, maintains the doctrine that all who do not believe in the divinity of Christ are beyond the pale of toleration. Who, after this imbecile display, can indulge the illusion that religious persecution has passed away, never to return?

On Liberty

J.S. Mill

1859

Chapter III: On Individuality, As One Of The Elements Of Well-being

SUCH being the reasons which make it imperative that human beings should be free to form opinions, and to express their opinions without reserve; and such the baneful consequences to the intellectual, and through that to the moral nature of man, unless this liberty is either conceded, or asserted in spite of prohibition; let us next examine whether the same reasons do not require that men should be free to act upon their opinions -- to carry these out in their lives, without hindrance, either physical or moral, from their fellow-men, so long as it is at their own risk and peril. This last proviso is of course indispensable. No one pretends that actions should be as free as opinions. On the contrary, even opinions lose their immunity, when the circumstances in which they are expressed are such as to constitute their expression a positive instigation to some mischievous act. An opinion that corndealers are starvers of the poor, or that private property is robbery, ought to be unmolested when simply circulated through the press, but may justly incur punishment when delivered orally to an excited mob assembled before the house of a corn-dealer, or when handed about among the same mob in the form of a placard. Acts of whatever kind, which, without justifiable cause, do harm to others, may be, and in the more important cases absolutely require to be, controlled by the unfavorable sentiments, and, when needful, by the active interference of mankind. The liberty of the individual must be thus far limited; he must not make himself a nuisance to other people. But if he refrains from molesting others in what concerns them, and merely acts according to his own inclination and judgment in things which concern himself, the same reasons which show that opinion should be free, prove also that he should be allowed, without molestation, to carry his opinions into practice at his own cost. That mankind are not infallible; that their truths, for the most part, are only half-truths; that unity of opinion, unless resulting from the fullest and freest comparison of opposite opinions, is not desirable, and diversity not an evil, but a good, until mankind are much more capable than at present of recognizing all sides of the truth, are principles applicable to men's modes of action, not less than to their opinions. As it is useful that while mankind are imperfect there should be different opinions, so is it that there should be different experiments of living; that free scope should be given to varieties of character, short of injury to others; and that the worth of different modes of life should be proved practically, when any one thinks fit to try them. It is desirable, in short, that in things which do not primarily concern others, individuality should assert itself. Where, not the person's own character, but the traditions of customs of other people are the rule of conduct, there is wanting one of the principal

ingredients of human happiness, and quite the chief ingredient of individual and social progress.

In maintaining this principle, the greatest difficulty to be encountered does not lie in the appreciation of means towards an acknowledged end, but in the indifference of persons in general to the end itself. If it were felt that the free development of individuality is one of the leading essentials of well-being; that it is not only a coordinate element with all that is designated by the terms civilization, instruction, education, culture, but is itself a necessary part and condition of all those things; there would be no danger that liberty should be undervalued, and the adjustment of the boundaries between it and social control would present no extraordinary difficulty. But the evil is, that individual spontaneity is hardly recognized by the common modes of thinking as having any intrinsic worth, or deserving any regard on its own account. The majority, being satisfied with the ways of mankind as they now are (for it is they who make them what they are), cannot comprehend why those ways should not be good enough for everybody; and what is more, spontaneity forms no part of the ideal of the majority of moral and social reformers, but is rather looked on with jealousy, as a troublesome and perhaps rebellious obstruction to the general acceptance of what these reformers, in their own judgment, think would be best for mankind. Few persons, out of Germany, even comprehend the meaning of the doctrine which Wilhelm von Humboldt, so eminent both as a savant and as a politician, made the text of a treatise -- that "the end of man, or that which is prescribed by the eternal or immutable dictates of reason, and not suggested by vague and transient desires, is the highest and most harmonious development of his powers to a complete and consistent whole;" that, therefore, the object "towards which every human being must ceaselessly direct his efforts, and on which especially those who design to influence their fellow-men must ever keep their eyes, is the individuality of power and development;" that for this there are two requisites, "freedom, and a variety of situations;" and that from the union of these arise "individual vigor and manifold diversity," which combine themselves in "originality."[1]

Little, however, as people are accustomed to a doctrine like that of Von Humboldt, and surprising as it may be to them to find so high a value attached to individuality, the question, one must nevertheless think, can only be one of degree. No one's idea of excellence in conduct is that people should do absolutely nothing but copy one another. No one would assert that people ought not to put into their mode of life, and into the conduct of their concerns, any impress whatever of their own judgment, or of their own individual character. On the other hand, it would be absurd to pretend that people ought to live as if nothing whatever had been known in the world before they came into it; as if experience had as yet done nothing towards showing that one mode of existence, or of conduct, is preferable to another. Nobody denies that people should be so taught and trained in youth, as to know and benefit by the ascertained results of human experience. But it is the privilege and proper condition of a human being, arrived at the maturity of his faculties, to use and interpret experience in his own way. It is for him to find out what part of recorded experience is properly applicable to his own circumstances and character. The traditions and customs of other people are, to a certain extent, evidence of what their experience has taught them; presumptive evidence, and as such, have a claim to this deference: but, in the first place, their experience may be too narrow; or they may not have interpreted it rightly. Secondly, their interpretation of experience may be correct but unsuitable to him. Customs are made for customary circumstances, and customary characters: and his circumstances or his character may be uncustomary. Thirdly, though the customs be both good as customs, and suitable to him, yet to conform to custom, merely as custom, does not educate or develop in him any of the qualities which are the distinctive

endowment of a human being. The human faculties of perception, judgment, discriminative feeling, mental activity, and even moral preference, are exercised only in making a choice. He who does anything because it is the custom, makes no choice. He gains no practice either in discerning or in desiring what is best. The mental and moral, like the muscular powers, are improved only by being used. The faculties are called into no exercise by doing a thing merely because others do it, no more than by believing a thing only because others believe it. If the grounds of an opinion are not conclusive to the person's own reason, his reason cannot be strengthened, but is likely to be weakened by his adopting it: and if the inducements to an act are not such as are consentaneous to his own feelings and character (where affection, or the rights of others are not concerned), it is so much done towards rendering his feelings and character inert and torpid, instead of active and energetic.

He who lets the world, or his own portion of it, choose his plan of life for him, has no need of any other faculty than the ape-like one of imitation. He who chooses his plan for himself, employs all his faculties. He must use observation to see, reasoning and judgment to foresee, activity to gather materials for decision, discrimination to decide, and when he has decided, firmness and self-control to hold to his deliberate decision. And these qualities he requires and exercises exactly in proportion as the part of his conduct which he determines according to his own judgment and feelings is a large one. It is possible that he might be guided in some good path, and kept out of harm's way, without any of these things. But what will be his comparative worth as a human being? It really is of importance, not only what men do, but also what manner of men they are that do it. Among the works of man, which human life is rightly employed in perfecting and beautifying, the first in importance surely is man himself. Supposing it were possible to get houses built, corn grown, battles fought, causes tried, and even churches erected and prayers said, by machinery -- by automatons in human form -- it would be a considerable loss to exchange for these automatons even the men and women who at present inhabit the more civilized parts of the world, and who assuredly are but starved specimens of what nature can and will produce. Human nature is not a machine to be built after a model, and set to do exactly the work prescribed for it, but a tree, which requires to grow and develop itself on all sides, according to the tendency of the inward forces which make it a living thing.

It will probably be conceded that it is desirable people should exercise their understandings, and that an intelligent following of custom, or even occasionally an intelligent deviation from custom, is better than a blind and simply mechanical adhesion to it. To a certain extent it is admitted, that our understanding should be our own: but there is not the same willingness to admit that our desires and impulses should be our own likewise; or that to possess impulses of our own, and of any strength, is anything but a peril and a snare. Yet desires and impulses are as much a part of a perfect human being, as beliefs and restraints: and strong impulses are only perilous when not properly balanced; when one set of aims and inclinations is developed into strength, while others, which ought to coexist with them, remain weak and inactive. It is not because men's desires are strong that they act ill; it is because their consciences are weak. There is no natural connection between strong impulses and a weak conscience. The natural connection is the other way. To say that one person's desires and feelings are stronger and more various than those of another, is merely to say that he has more of the raw material of human nature, and is therefore capable, perhaps of more evil, but certainly of more good. Strong impulses are but another name for energy. Energy may be turned to bad uses; but more good may always be made of an energetic nature, than of an indolent and impassive one. Those who have most natural feeling, are always

those whose cultivated feelings may be made the strongest. The same strong susceptibilities which make the personal impulses vivid and powerful, are also the source from whence are generated the most passionate love of virtue, and the sternest selfcontrol. It is through the cultivation of these, that society both does its duty and protects its interests: not by rejecting the stuff of which heroes are made, because it knows not how to make them. A person whose desires and impulses are his own -- are the expression of his own nature, as it has been developed and modified by his own culture -- is said to have a character. One whose desires and impulses are not his owN, has no character, no more than a steam-engine has a character. If, in addition to being his own, his impulses are strong, and are under the government of a strong will, he has an energetic character. Whoever thinks that individuality of desires and impulses should not be encouraged to unfold itself, must maintain that society has no need of strong natures -- is not the better for containing many persons who have much character -- and that a high general average of energy is not desirable.

In some early states of society, these forces might be, and were, too much ahead of the power which society then possessed of disciplining and controlling them. There has been a time when the element of spontaneity and individuality was in excess, and the social principle had a hard struggle with it. The difficulty then was, to induce men of strong bodies or minds to pay obedience to any rules which required them to control their impulses. To overcome this difficulty, law and discipline, like the Popes struggling against the Emperors, asserted a power over the whole man, claiming to control all his life in order to control his character -- which society had not found any other sufficient means of binding. But society has now fairly got the better of individuality; and the danger which threatens human nature is not the excess, but the deficiency, of personal impulses and preferences. Things are vastly changed, since the passions of those who were strong by station or by personal endowment were in a state of habitual rebellion against laws and ordinances, and required to be rigorously chained up to enable the persons within their reach to enjoy any particle of security. In our times, from the highest class of society down to the lowest every one lives as under the eye of a hostile and dreaded censorship. Not only in what concerns others, but in what concerns only themselves, the individual, or the family, do not ask themselves -- what do I prefer? or, what would suit my character and disposition? or, what would allow the best and highest in me to have fair play, and enable it to grow and thrive? They ask themselves, what is suitable to my position? what is usually done by persons of my station and pecuniary circumstances? or (worse still) what is usually done by persons of a station and circumstances superior to mine? I do not mean that they choose what is customary, in preference to what suits their own inclination. It does not occur to them to have any inclination, except for what is customary. Thus the mind itself is bowed to the yoke: even in what people do for pleasure, conformity is the first thing thought of; they like in crowds; they exercise choice only among things commonly done: peculiarity of taste, eccentricity of conduct, are shunned equally with crimes: until by dint of not following their own nature, they have no nature to follow: their human capacities are withered and starved: they become incapable of any strong wishes or native pleasures, and are generally without either opinions or feelings of home growth, or properly their own. Now is this, or is it not, the desirable condition of human nature?

It is so, on the Calvinistic theory. According to that, the one great offence of man is Self-will. All the good of which humanity is capable, is comprised in Obedience. You have no choice; thus you must do, and no otherwise; "whatever is not a duty is a sin." Human nature being radically corrupt, there is no redemption for any one until human nature is killed within him. To one

holding this theory of life, crushing out any of the human faculties, capacities, and susceptibilities, is no evil: man needs no capacity, but that of surrendering himself to the will of God: and if he uses any of his faculties for any other purpose but to do that supposed will more effectually, he is better without them. That is the theory of Calvinism; and it is held, in a mitigated form, by many who do not consider themselves Calvinists; the mitigation consisting in giving a less ascetic interpretation to the alleged will of God; asserting it to be his will that mankind should gratify some of their inclinations; of course not in the manner they themselves prefer, but in the way of obedience, that is, in a way prescribed to them by authority; and, therefore, by the necessary conditions of the case, the same for all.

In some such insidious form there is at present a strong tendency to this narrow theory of life, and to the pinched and hidebound type of human character which it patronizes. Many persons, no doubt, sincerely think that human beings thus cramped and dwarfed, are as their Maker designed them to be; just as many have thought that trees are a much finer thing when clipped into pollards, or cut out into figures of animals, than as nature made them. But if it be any part of religion to believe that man was made by a good Being, it is more consistent with that faith to believe, that this Being gave all human faculties that they might be cultivated and unfolded, not rooted out and consumed, and that he takes delight in every nearer approach made by his creatures to the ideal conception embodied in them, every increase in any of their capabilities of comprehension, of action, or of enjoyment. There is a different type of human excellence from the Calvinistic; a conception of humanity as having its nature bestowed on it for other purposes than merely to be abnegated. "Pagan selfassertion" is one of the elements of human worth, as well as "Christian self-denial."[2] There is a Greek ideal of self-development, which the Platonic and Christian ideal of self-government blends with, but does not supersede. It may be better to be a John Knox than an Alcibiades, but it is better to be a Pericles than either; nor would a Pericles, if we had one in these days, be without anything good which belonged to John Knox.

It is not by wearing down into uniformity all that is individual in themselves, but by cultivating it and calling it forth, within the limits imposed by the rights and interests of others, that human beings become a noble and beautiful object of contemplation; and as the works partake the character of those who do them, by the same process human life also becomes rich, diversified, and animating, furnishing more abundant aliment to high thoughts and elevating feelings, and strengthening the tie which binds every individual to the race, by making the race infinitely better worth belonging to. In proportion to the development of his individuality, each person becomes more valuable to himself, and is therefore capable of being more valuable to others. There is a greater fulness of life about his own existence, and when there is more life in the units there is more in the mass which is composed of them. As much compression as is necessary to prevent the stronger specimens of human nature from encroaching on the rights of others, cannot be dispensed with; but for this there is ample compensation even in the point of view of human development. The means of development which the individual loses by being prevented from gratifying his inclinations to the injury of others, are chiefly obtained at the expense of the development of other people. And even to himself there is a full equivalent in the better development of the social part of his nature, rendered possible by the restraint put upon the selfish part. To be held to rigid rules of justice for the sake of others, develops the feelings and capacities which have the good of others for their object. But to be restrained in things not affecting their good, by their mere displeasure, develops nothing valuable, except such force of character as may unfold itself in resisting the restraint. If acquiesced in, it dulls and blunts the whole nature. To give any fair play to the nature

of each, it is essential that different persons should be allowed to lead different lives. In proportion as this latitude has been exercised in any age, has that age been noteworthy to posterity. Even despotism does not produce its worst effects, so long as Individuality exists under it; and whatever crushes individuality is despotism, by whatever name it may be called, and whether it professes to be enforcing the will of God or the injunctions of men.

Having said that Individuality is the same thing with development, and that it is only the cultivation of individuality which produces, or can produce, well-developed human beings, I might here close the argument: for what more or better can be said of any condition of human affairs, than that it brings human beings themselves nearer to the best thing they can be? or what worse can be said of any obstruction to good, than that it prevents this? Doubtless, however, these considerations will not suffice to convince those who most need convincing; and it is necessary further to show, that these developed human beings are of some use to the undeveloped -- to point out to those who do not desire liberty, and would not avail themselves of it, that they may be in some intelligible manner rewarded for allowing other people to make use of it without hindrance.

In the first place, then, I would suggest that they might possibly learn something from them. It will not be denied by anybody, that originality is a valuable element in human affairs. There is always need of persons not only to discover new truths, and point out when what were once truths are true no longer, but also to commence new practices, and set the example of more enlightened conduct, and better taste and sense in human life. This cannot well be gainsaid by anybody who does not believe that the world has already attained perfection in all its ways and practices. It is true that this benefit is not capable of being rendered by everybody alike: there are but few persons, in comparison with the whole of mankind, whose experiments, if adopted by others, would be likely to be any improvement on established practice. But these few are the salt of the earth; without them, human life would become a stagnant pool. Not only is it they who introduce good things which did not before exist; it is they who keep the life in those which already existed. If there were nothing new to be done, would human intellect cease to be necessary? Would it be a reason why those who do the old things should forget why they are done, and do them like cattle, not like human beings? There is only too great a tendency in the best beliefs and practices to degenerate into the mechanical; and unless there were a succession of persons whose ever-recurring originality prevents the grounds of those beliefs and practices from becoming merely traditional, such dead matter would not resist the smallest shock from anything really alive, and there would be no reason why civilization should not die out, as in the Byzantine Empire. Persons of genius, it is true, are, and are always likely to be, a small minority; but in order to have them, it is necessary to preserve the soil in which they grow. Genius can only breathe freely in an atmosphere of freedom. Persons of genius are, ex vi termini, more individual than any other people -- less capable, consequently, of fitting themselves, without hurtful compression, into any of the small number of moulds which society provides in order to save its members the trouble of forming their own character. If from timidity they consent to be forced into one of these moulds, and to let all that part of themselves which cannot expand under the pressure remain unexpanded, society will be little the better for their genius. If they are of a strong character, and break their fetters they become a mark for the society which has not succeeded in reducing them to common-place, to point at with solemn warning as "wild," "erratic," and the like; much as if one should complain of the Niagara river for not flowing smoothly between its banks like a Dutch canal.

I insist thus emphatically on the importance of genius, and the necessity of allowing it to unfold itself freely both in thought and in practice, being well aware that no one will deny the position in

theory, but knowing also that almost every one, in reality, is totally indifferent to it. People think genius a fine thing if it enables a man to write an exciting poem, or paint a picture. But in its true sense, that of originality in thought and action, though no one says that it is not a thing to be admired, nearly all, at heart, think they can do very well without it. Unhappily this is too natural to be wondered at. Originality is the one thing which unoriginal minds cannot feel the use of. They cannot see what it is to do for them: how should they? If they could see what it would do for them, it would not be originality. The first service which originality has to render them, is that of opening their eyes: which being once fully done, they would have a chance of being themselves original. Meanwhile, recollecting that nothing was ever yet done which some one was not the first to do, and that all good things which exist are the fruits of originality, let them be modest enough to believe that there is something still left for it to accomplish, and assure themselves that they are more in need of originality, the less they are conscious of the want.

In sober truth, whatever homage may be professed, or even paid, to real or supposed mental superiority, the general tendency of things throughout the world is to render mediocrity the ascendant power among mankind. In ancient history, in the Middle Ages, and in a diminishing degree through the long transition from feudality to the present time, the individual was a power in himself; and If he had either great talents or a high social position, he was a considerable power. At present individuals are lost in the crowd. In politics it is almost a triviality to say that public opinion now rules the world. The only power deserving the name is that of masses, and of governments while they make themselves the organ of the tendencies and instincts of masses. This is as true in the moral and social relations of private life as in public transactions. Those whose opinions go by the name of public opinion, are not always the same sort of public: in America, they are the whole white population; in England, chiefly the middle class. But they are always a mass, that is to say, collective mediocrity. And what is still greater novelty, the mass do not now take their opinions from dignitaries in Church or State, from ostensible leaders, or from books. Their thinking is done for them by men much like themselves, addressing them or speaking in their name, on the spur of the moment, through the newspapers. I am not complaining of all this. I do not assert that anything better is compatible, as a general rule, with the present low state of the human mind. But that does not hinder the government of mediocrity from being mediocre government. No government by a democracy or a numerous aristocracy, either in its political acts or in the opinions, qualities, and tone of mind which it fosters, ever did or could rise above mediocrity, except in so far as the sovereign Many have let themselves be guided (which in their best times they always have done) by the counsels and influence of a more highly gifted and instructed One or Few. The initiation of all wise or noble things, comes and must come from individuals; generally at first from some one individual. The honor and glory of the average man is that he is capable of following that initiative; that he can respond internally to wise and noble things, and be led to them with his eyes open. I am not countenancing the sort of "hero-worship" which applauds the strong man of genius for forcibly seizing on the government of the world and making it do his bidding in spite of itself. All he can claim is, freedom to point out the way. The power of compelling others into it, is not only inconsistent with the freedom and development of all the rest, but corrupting to the strong man himself. It does seem, however, that when the opinions of masses of merely average men are everywhere become or becoming the dominant power, the counterpoise and corrective to that tendency would be, the more and more pronounced individuality of those who stand on the higher eminences of thought. It Is in these circumstances most especially, that exceptional individuals, instead of being deterred, should be encouraged in

acting differently from the mass. In other times there was no advantage in their doing so, unless they acted not only differently, but better. In this age the mere example of non-conformity, the mere refusal to bend the knee to custom, is itself a service. Precisely because the tyranny of opinion is such as to make eccentricity a reproach, it is desirable, in order to break through that tyranny, that people should be eccentric. Eccentricity has always abounded when and where strength of character has abounded; and the amount of eccentricity in a society has generally been proportional to the amount of genius, mental vigor, and moral courage which it contained. That so few now dare to be eccentric, marks the chief danger of the time.

I have said that it is important to give the freest scope possible to uncustomary things, in order that it may in time appear which of these are fit to be converted into customs. But independence of action, and disregard of custom are not solely deserving of encouragement for the chance they afford that better modes of action, and customs more worthy of general adoption, may be struck out; nor is it only persons of decided mental superiority who have a just claim to carry on their lives in their own way. There is no reason that all human existences should be constructed on some one, or some small number of patterns. If a person possesses any tolerable amount of common sense and experience, his own mode of laying out his existence is the best, not because it is the best in itself, but because it is his own mode. Human beings are not like sheep; and even sheep are not undistinguishably alike. A man cannot get a coat or a pair of boots to fit him, unless they are either made to his measure, or he has a whole warehouseful to choose from: and is it easier to fit him with a life than with a coat, or are human beings more like one another in their whole physical and spiritual conformation than in the shape of their feet? If it were only that people have diversities of taste that is reason enough for not attempting to shape them all after one model. But different persons also require different conditions for their spiritual development; and can no more exist healthily in the same moral, than all the variety of plants can in the same physical atmosphere and climate. The same things which are helps to one person towards the cultivation of his higher nature, are hindrances to another. The same mode of life is a healthy excitement to one, keeping all his faculties of action and enjoyment in their best order, while to another it is a distracting burden, which suspends or crushes all internal life. Such are the differences among human beings in their sources of pleasure, their susceptibilities of pain, and the operation on them of different physical and moral agencies, that unless there is a corresponding diversity in their modes of life, they neither obtain their fair share of happiness, nor grow up to the mental, moral, and aesthetic stature of which their nature is capable. Why then should tolerance, as far as the public sentiment is concerned, extend only to tastes and modes of life which extort acquiescence by the multitude of their adherents? Nowhere (except in some monastic institutions) is diversity of taste entirely unrecognized; a person may without blame, either like or dislike rowing, or smoking, or music, or athletic exercises, or chess, or cards, or study, because both those who like each of these things, and those who dislike them, are too numerous to be put down. But the man, and still more the woman, who can be accused either of doing "what nobody does," or of not doing "what everybody does," is the subject of as much depreciatory remark as if he or she had committed some grave moral delinquency. Persons require to possess a title, or some other badge of rank, or the consideration of people of rank, to be able to indulge somewhat in the luxury of doing as they like without detriment to their estimation. To indulge somewhat, I repeat: for whoever allow themselves much of that in dulgence, incur the risk of something worse than disparaging speeches -- they are in peril of a commission de lunatico, and of having their property taken from them and given to their relations.[3]

There is one characteristic of the present direction of public opinion, peculiarly calculated to make it intolerant of any marked demonstration of individuality. The general average of mankind are not only moderate in intellect, but also moderate in inclinations: they have no tastes or wishes strong enough to incline them to do anything unusual, and they consequently do not understand those who have, and class all such with the wild and intemperate whom they are accustomed to look down upon. Now, in addition to this fact which is general, we have only to suppose that a strong movement has set in towards the improvement of morals, and it is evident what we have to expect. In these days such a movement has set in; much has actually been effected in the way of increased regularity of conduct, and discouragement of excesses; and there is a philanthropic spirit abroad, for the exercise of which there is no more inviting field than the moral and prudential improvement of our fellow-creatures. These tendencies of the times cause the public to be more disposed than at most former periods to prescribe general rules of conduct, and endeavor to make every one conform to the approved standard. And that standard, express or tacit, is to desire nothing strongly. Its ideal of character is to be without any marked character; to maim by compression, like a Chinese lady's foot, every part of human nature which stands out prominently, and tends to make the person markedly dissimilar in outline to commonplace humanity.

As is usually the case with ideals which exclude one half of what is desirable, the present standard of approbation produces only an inferior imitation of the other half. Instead of great energies guided by vigorous reason, and strong feelings strongly controlled by a conscientious will, its result is weak feelings and weak energies, which therefore can be kept in outward conformity to rule without any strength either of will or of reason. Already energetic characters on any large scale are becoming merely traditional. There is now scarcely any outlet for energy in this country except business. The energy expended in that may still be regarded as considerable. What little is left from that employment, is expended on some hobby; which may be a useful, even a philanthropic hobby, but is always some one thing, and generally a thing of small dimensions. The greatness of England is now all collective: individually small, we only appear capable of anything great by our habit of combining; and with this our moral and religious philanthropists are perfectly contented. But it was men of another stamp than this that made England what it has been; and men of another stamp will be needed to prevent its decline.

The despotism of custom is everywhere the standing hindrance to human advancement, being in unceasing antagonism to that disposition to aim at something better than customary, which is called, according to circumstances, the spirit of liberty, or that of progress or improvement. The spirit of improvement is not always a spirit of liberty, for it may aim at forcing improvements on an unwilling people; and the spirit of liberty, in so far as it resists such attempts, may ally itself locally and temporarily with the opponents of improvement; but the only unfailing and permanent source of improvement is liberty, since by it there are as many possible independent centres of improvement as there are individuals. The progressive principle, however, in either shape, whether as the love of liberty or of improvement, is antagonistic to the sway of Custom, involving at least emancipation from that yoke; and the contest between the two constitutes the chief interest of the history of mankind. The greater part of the world has, properly speaking, no history, because the despotism of Custom is complete. This is the case over the whole East. Custom is there, in all things, the final appeal; Justice and right mean conformity to custom; the argument of custom no one, unless some tyrant intoxicated with power, thinks of resisting. And we see the result. Those nations must once have had originality; they did not start out of the ground populous, lettered, and versed in many of the arts of life; they made themselves all this, and were then the greatest and

most powerful nations in the world. What are they now? The subjects or dependents of tribes whose forefathers wandered in the forests when theirs had magnificent palaces and gorgeous temples, but over whom custom exercised only a divided rule with liberty and progress. A people, it appears, may be progressive for a certain length of time, and then stop: when does it stop? When it ceases to possess individuality. If a similar change should befall the nations of Europe, it will not be in exactly the same shape: the despotism of custom with which these nations are threatened is not precisely stationariness. It proscribes singularity, but it does not preclude change, provided all change together. We have discarded the fixed costumes of our forefathers; every one must still dress like other people, but the fashion may change once or twice a year. We thus take care that when there is change, it shall be for change's sake, and not from any idea of beauty or convenience; for the same idea of beauty or convenience would not strike all the world at the same moment, and be simultaneously thrown aside by all at another moment. But we are progressive as well as changeable: we continually make new inventions in mechanical things, and keep them until they are again superseded by better; we are eager for improvement in politics, in education, even in morals, though in this last our idea of improvement chiefly consists in persuading or forcing other people to be as good as ourselves. It is not progress that we object to; on the contrary, we flatter ourselves that we are the most progressive people who ever lived. It is individuality that we war against: we should think we had done wonders if we had made ourselves all alike; forgetting that the unlikeness of one person to another is generally the first thing which draws the attention of either to the imperfection of his own type, and the superiority of another, or the possibility, by combining the advantages of both, of producing something better than either. We have a warning example in China -- a nation of much talent, and, in some respects, even wisdom, owing to the rare good fortune of having been provided at an early period with a particularly good set of customs, the work, in some measure, of men to whom even the most enlightened European must accord, under certain limitations, the title of sages and philosophers. They are remarkable, too, in the excellence of their apparatus for impressing, as far as possible, the best wisdom they possess upon every mind in the community, and securing that those who have appropriated most of it shall occupy the posts of honor and power. Surely the people who did this have discovered the secret of human progressiveness, and must have kept themselves steadily at the head of the movement of the world. On the contrary, they have become stationary -- have remained so for thousands of years; and if they are ever to be farther improved, it must be by foreigners. They have succeeded beyond all hope in what English philanthropists are so industriously working at -- in making a people all alike, all governing their thoughts and conduct by the same maxims and rules; and these are the fruits. The modern regime of public opinion is, in an unorganized form, what the Chinese educational and political systems are in an organized; and unless individuality shall be able successfully to assert itself against this yoke, Europe, notwithstanding its noble antecedents and its professed Christianity, will tend to become another China.

What is it that has hitherto preserved Europe from this lot? What has made the European family of nations an improving, instead of a stationary portion of mankind? Not any superior excellence in them, which when it exists, exists as the effect, not as the cause; but their remarkable diversity of character and culture. Individuals, classes, nations, have been extremely unlike one another: they have struck out a great variety of paths, each leading to something valuable; and although at every period those who travelled in different paths have been intolerant of one another, and each would have thought it an excellent thing if all the rest could have been compelled to travel his road, their attempts to thwart each other's development have rarely had any permanent success, and each has

in time endured to receive the good which the others have offered. Europe is, in my judgment, wholly indebted to this plurality of paths for its progressive and many-sided development. But it already begins to possess this benefit in a considerably less degree. It is decidedly advancing towards the Chinese ideal of making all people alike. M. de Tocqueville, in his last important work, remarks how much more the Frenchmen of the present day resemble one another, than did those even of the last generation. The same remark might be made of Englishmen in a far greater degree. In a passage already quoted from Wilhelm von Humboldt, he points out two things as necessary conditions of human development, because necessary to render people unlike one another; namely, freedom, and variety of situations. The second of these two conditions is in this country every day diminishing. The circumstances which surround different classes and individuals, and shape their characters, are daily becoming more assimilated. Formerly, different ranks, different neighborhoods, different trades and professions lived in what might be called different worlds; at present, to a great degree, in the same. Comparatively speaking, they now read the same things, listen to the same things, see the same things, go to the same places, have their hopes and fears directed to the same objects, have the same rights and liberties, and the same means of asserting them. Great as are the differences of position which remain, they are nothing to those which have ceased. And the assimilation is still proceeding. All the political changes of the age promote it, since they all tend to raise the low and to lower the high. Every extension of education promotes it, because education brings people under common influences, and gives them access to the general stock of facts and sentiments. Improvements in the means of communication promote it, by bringing the inhabitants of distant places into personal contact, and keeping up a rapid flow of changes of residence between one place and another. The increase of commerce and manufactures promotes it, by diffusing more widely the advantages of easy circumstances, and opening all objects of ambition, even the highest, to general competition, whereby the desire of rising becomes no longer the character of a particular class, but of all classes. A more powerful agency than even all these, in bringing about a general similarity among mankind, is the complete establishment, in this and other free countries, of the ascendancy of public opinion in the State. As the various social eminences which enabled persons entrenched on them to disregard the opinion of the multitude, gradually became levelled; as the very idea of resisting the will of the public, when it is positively known that they have a will, disappears more and more from the minds of practical politicians; there ceases to be any social support for non-conformity -- any substantive power in society, which, itself opposed to the ascendancy of numbers, is interested in taking under its protection opinions and tendencies at variance with those of the public.

The combination of all these causes forms so great a mass of influences hostile to Individuality, that it is not easy to see how it can stand its ground. It will do so with increasing difficulty, unless the intelligent part of the public can be made to feel its value -- to see that it is good there should be differences, even though not for the better, even though, as it may appear to them, some should be for the worse. If the claims of Individuality are ever to be asserted, the time is now, while much is still wanting to complete the enforced assimilation. It is only in the earlier stages that any stand can be successfully made against the encroachment. The demand that all other people shall resemble ourselves, grows by what it feeds on. If resistance waits till life is reduced nearly to one uniform type, all deviations from that type will come to be considered impious, immoral, even monstrous and contrary to nature. Mankind speedily become unable to conceive diversity, when they have been for some time unaccustomed to see it.

11-13.

[2] Sterling's Essays.

[3] There is something both contemptible and frightful in the sort of evidence on which, of late years, any person can be judicially declared unfit for the management of his affairs; and after his death, his disposal of his property can be set aside, if there is enough of it to pay the expenses of litigation -- which are charged on the property itself. All of the minute details of his daily life are pried into, and whatever is found which, seen through the medium of the perceiving and escribing faculties of the lowest of the low, bears an appearance unlike absolute commonplace, is laid before the jury as evidence of insanity, and often with success; the jurors being little, if at all, less vulgar and ignorant than the witnesses; while the judges, with that extraordinary want of knowledge of human nature and life which continually astonishes us in English lawyers, often help to mislead them. These trials speak volumes as to the state of feeling and opinion among the vulgar with regard to human liberty. So far from setting any value on individuality -- so far from respecting the rights of each individual to act, in things indifferent, as seems good to his own judgment and inclinations, judges and juries cannot even conceive that a person in a state of sanity can desire such freedom. In former days, when it was proposed to burn atheists, charitable people used to suggest putting them in a madhouse instead: it would be nothing surprising now-a-days were we to see this done, and the doers applauding themselves, because, instead of persecuting for religion, they had adopted so humane and Christian a mode of treating these unfortunates, not without a silent satisfaction at their having thereby obtained their deserts.

Chapter IV: Of The Limits To The Authority Of Society Over The Individual

WHAT, then, is the rightful limit to the sovereignty of the individual over himself? Where does the authority of society begin? How much of human life should be assigned to individuality, and how much to society?

Each will receive its proper share, if each has that which more particularly concerns it. To individuality should belong the part of life in which it is chiefly the individual that is interested; to society, the part which chiefly interests society.

Though society is not founded on a contract, and though no good purpose is answered by inventing a contract in order to deduce social obligations from it, every one who receives the protection of society owes a return for the benefit, and the fact of living in society renders it indispensable that each should be bound to observe a certain line of conduct towards the rest. This conduct consists, first, in not injuring the interests of one another; or rather certain interests, which, either by express legal provision or by tacit understanding, ought to be considered as rights; and secondly, in each person's bearing his share (to be fixed on some equitable principle) of the labors and sacrifices incurred for defending the society or its members from injury and molestation. These conditions society is justified in enforcing, at all costs to those who endeavor to withhold fulfilment. Nor is this all that society may do. The acts of an individual may be hurtful to others, or wanting in due consideration for their welfare, without going the length of violating any of their constituted rights. The offender may then be justly punished by opinion, though not by law. As soon as any part of a person's conduct affects prejudicially the interests of others, society has jurisdiction over it, and the question whether the general welfare will or will not be promoted by interfering with it, becomes open to discussion. But there is no room for entertaining any such question when a person's conduct affects the interests of no persons besides himself, or needs not affect them unless they like (all the persons concerned being of full age, and the ordinary amount of understanding). In all such cases there should be perfect freedom, legal and social, to do the action and stand the consequences.

It would be a great misunderstanding of this doctrine, to suppose that it is one of selfish indifference, which pretends that human beings have no business with each other's conduct in life, and that they should not concern themselves about the well-doing or well-being of one another, unless their own interest is involved. Instead of any diminution, there is need of a great increase of disinterested exertion to promote the good of others. But disinterested benevolence can find other

instruments to persuade people to their good, than whips and scourges, either of the literal or the metaphorical sort. I am the last person to undervalue the self-regarding virtues; they are only second in importance, if even second, to the social. It is equally the business of education to cultivate both. But even education works by conviction and persuasion as well as by compulsion, and it is by the former only that, when the period of education is past, the self-regarding virtues should be inculcated. Human beings owe to each other help to distinguish the better from the worse, and encouragement to choose the former and avoid the latter. They should be forever stimulating each other to increased exercise of their higher faculties, and increased direction of their feelings and aims towards wise instead of foolish, elevating instead of degrading, objects and contemplations. But neither one person, nor any number of persons, is warranted in saying to another human creature of ripe years, that he shall not do with his life for his own benefit what he chooses to do with it. He is the person most interested in his own well-being, the interest which any other person, except in cases of strong personal attachment, can have in it, is trifling, compared with that which he himself has; the interest which society has in him individually (except as to his conduct to others) is fractional, and altogether indirect: while, with respect to his own feelings and circumstances, the most ordinary man or woman has means of knowledge immeasurably surpassing those that can be possessed by any one else. The interference of society to overrule his judgment and purposes in what only regards himself, must be grounded on general presumptions; which may be altogether wrong, and even if right, are as likely as not to be misapplied to individual cases, by persons no better acquainted with the circumstances of such cases than those are who look at them merely from without. In this department, therefore, of human affairs, Individuality has its proper field of action. In the conduct of human beings towards one another, it is necessary that general rules should for the most part be observed, in order that people may know what they have to expect; but in each person's own concerns, his individual spontaneity is entitled to free exercise. Considerations to aid his judgment, exhortations to strengthen his will, may be offered to him, even obtruded on him, by others; but he, himself, is the final judge. All errors which he is likely to commit against advice and warning, are far outweighed by the evil of allowing others to constrain him to what they deem his good.

I do not mean that the feelings with which a person is regarded by others, ought not to be in any way affected by his self-regarding qualities or deficiencies. This is neither possible nor desirable. If he is eminent in any of the qualities which conduce to his own good, he is, so far, a proper object of admiration. He is so much the nearer to the ideal perfection of human nature. If he is grossly deficient in those qualities, a sentiment the opposite of admiration will follow. There is a degree of folly, and a degree of what may be called (though the phrase is not unobjectionable) lowness or depravation of taste, which, though it cannot justify doing harm to the person who manifests it, renders him necessarily and properly a subject of distaste, or, in extreme cases, even of contempt: a person could not have the opposite qualities in due strength without entertaining these feelings. Though doing no wrong to any one, a person may so act as to compel us to judge him, and feel to him, as a fool, or as a being of an inferior order: and since this judgment and feeling are a fact which he would prefer to avoid, it is doing him a service to warn him of it beforehand, as of any other disagreeable consequence to which he exposes himself. It would be well, indeed, if this good office were much more freely rendered than the common notions of politeness at present permit, and if one person could honestly point out to another that he thinks him in fault, without being considered unmannerly or presuming. We have a right, also, in various ways, to act upon our unfavorable opinion of any one, not to the oppression of his individuality, but in the exercise of

ours. We are not bound, for example, to seek his society; we have a right to avoid it (though not to parade the avoidance), for we have a right to choose the society most acceptable to us. We have a right, and it may be our duty, to caution others against him, if we think his example or conversation likely to have a pernicious effect on those with whom he associates. We may give others a preference over him in optional good offices, except those which tend to his improvement. In these various modes a person may suffer very severe penalties at the hands of others, for faults which directly concern only himself; but he suffers these penalties only in so far as they are the natural, and, as it were, the spontaneous consequences of the faults themselves, not because they are purposely inflicted on him for the sake of punishment. A person who shows rashness, obstinacy, self-conceit -- who cannot live within moderate means -- who cannot restrain himself from hurtful indulgences -- who pursues animal pleasures at the expense of those of feeling and intellect -- must expect to be lowered in the opinion of others, and to have a less share of their favorable sentiments, but of this he has no right to complain, unless he has merited their favor by special excellence in his social relations, and has thus established a title to their good offices, which is not affected by his demerits towards himself.

What I contend for is, that the inconveniences which are strictly inseparable from the unfavorable judgment of others, are the only ones to which a person should ever be subjected for that portion of his conduct and character which concerns his own good, but which does not affect the interests of others in their relations with him. Acts injurious to others require a totally different treatment. Encroachment on their rights; infliction on them of any loss or damage not justified by his own rights; falsehood or duplicity in dealing with them; unfair or ungenerous use of advantages over them; even selfish abstinence from defending them against injury -- these are fit objects of moral reprobation, and, in grave cases, of moral retribution and punishment. And not only these acts, but the dispositions which lead to them, are properly immoral, and fit subjects of disapprobation which may rise to abhorrence. Cruelty of disposition; malice and ill-nature; that most anti-social and odious of all passions, envy; dissimulation and insincerity, irascibility on insufficient cause, and resentment disproportioned to the provocation; the love of domineering over others; the desire to engross more than one's share of advantages (the [greekword] of the Greeks); the pride which derives gratification from the abasement of others; the egotism which thinks self and its concerns more important than everything else, and decides all doubtful questions in his own favor; -- these are moral vices, and constitute a bad and odious moral character: unlike the self-regarding faults previously mentioned, which are not properly immoralities, and to whatever pitch they may be carried, do not constitute wickedness. They may be proofs of any amount of folly, or want of personal dignity and self-respect; but they are only a subject of moral reprobation when they involve a breach of duty to others, for whose sake the individual is bound to have care for himself. What are called duties to ourselves are not socially obligatory, unless circumstances render them at the same time duties to others. The term duty to oneself, when it means anything more than prudence, means self-respect or self-development; and for none of these is any one accountable to his fellow-creatures, because for none of them is it for the good of mankind that he be held accountable to them.

The distinction between the loss of consideration which a person may rightly incur by defect of prudence or of personal dignity, and the reprobation which is due to him for an offence against the rights of others, is not a merely nominal distinction. It makes a vast difference both in our feelings and in our conduct towards him, whether he displeases us in things in which we think we have a right to control him, or in things in which we know that we have not. If he displeases us, we may

express our distaste, and we may stand aloof from a person as well as from a thing that displeases us; but we shall not therefore feel called on to make his life uncomfortable. We shall reflect that he already bears, or will bear, the whole penalty of his error; if he spoils his life by mismanagement, we shall not, for that reason, desire to spoil it still further: instead of wishing to punish him, we shall rather endeavor to alleviate his punishment, by showing him how he may avoid or cure the evils his conduct tends to bring upon him. He may be to us an object of pity, perhaps of dislike, but not of anger or resentment; we shall not treat him like an enemy of society: the worst we shall think ourselves justified in doing is leaving him to himself, If we do not interfere benevolently by showing interest or concern for him. It is far otherwise if he has infringed the rules necessary for the protection of his fellow-creatures, individually or collectively. The evil consequences of his acts do not then fall on himself, but on others; and society, as the protector of all its members, must retaliate on him; must inflict pain on him for the express purpose of punishment, and must take care that it be sufficiently severe. In the one case, he is an offender at our bar, and we are called on not only to sit in judgment on him, but, in one shape or another, to execute our own sentence: in the other case, it is not our part to inflict any suffering on him, except what may incidentally follow from our using the same liberty in the regulation of our own affairs, which we allow to him in his.

The distinction here pointed out between the part of a person's life which concerns only himself, and that which concerns others, many persons will refuse to admit. How (it may be asked) can any part of the conduct of a member of society be a matter of indifference to the other members? No person is an entirely isolated being; it is impossible for a person to do anything seriously or permanently hurtful to himself, without mischief reaching at least to his near connections, and often far beyond them. If he injures his property, he does harm to those who directly or indirectly derived support from it, and usually diminishes, by a greater or less amount, the general resources of the community. If he deteriorates his bodily or mental faculties, he not only brings evil upon all who depended on him for any portion of their happiness, but disqualifies himself for rendering the services which he owes to his fellow-creatures generally; perhaps becomes a burden on their affection or benevolence; and if such conduct were very frequent, hardly any offence that is committed would detract more from the general sum of good. Finally, if by his vices or follies a person does no direct harm to others, he is nevertheless (it may be said) injurious by his example; and ought to be compelled to control himself, for the sake of those whom the sight or knowledge of his conduct might corrupt or mislead.

And even (it will be added) if the consequences of misconduct could be confined to the vicious or thoughtless individual, ought society to abandon to their own guidance those who are manifestly unfit for it? If protection against themselves is confessedly due to children and persons under age, is not society equally bound to afford it to persons of mature years who are equally incapable of self-government? If gambling, or drunkenness, or incontinence, or idleness, or uncleanliness, are as injurious to happiness, and as great a hindrance to improvement, as many or most of the acts prohibited by law, why (it may be asked) should not law, so far as is consistent with practicability and social convenience, endeavor to repress these also? And as a supplement to the unavoidable imperfections of law, ought not opinion at least to organize a powerful police against these vices, and visit rigidly with social penalties those who are known to practise them? There is no question here (it may be said) about restricting individuality, or impeding the trial of new and original experiments in living. The only things it is sought to prevent are things which have been tried and condemned from the beginning of the world until now; things which experience has shown not to be useful or suitable to any person's individuality. There must be some length of time and amount

of experience, after which a moral or prudential truth may be regarded as established, and it is merely desired to prevent generation after generation from falling over the same precipice which has been fatal to their predecessors.

I fully admit that the mischief which a person does to himself, may seriously affect, both through their sympathies and their interests, those nearly connected with him, and in a minor degree, society at large. When, by conduct of this sort, a person is led to violate a distinct and assignable obligation to any other person or persons, the case is taken out of the self-regarding class, and becomes amenable to moral disapprobation in the proper sense of the term. If, for example, a man, through intemperance or extravagance, becomes unable to pay his debts, or, having undertaken the moral responsibility of a family, becomes from the same cause incapable of supporting or educating them, he is deservedly reprobated, and might be justly punished; but it is for the breach of duty to his family or creditors, not for the extravagence. If the resources which ought to have been devoted to them, had been diverted from them for the most prudent investment, the moral culpability would have been the same. George Barnwell murdered his uncle to get money for his mistress, but if he had done it to set himself up in business, he would equally have been hanged. Again, in the frequent case of a man who causes grief to his family by addiction to bad habits, he deserves reproach for his unkindness or ingratitude; but so he may for cultivating habits not in themselves vicious, if they are painful to those with whom he passes his life, or who from personal ties are dependent on him for their comfort. Whoever fails in the consideration generally due to the interests and feelings of others, not being compelled by some more imperative duty, or justified by allowable self-preference, is a subject of moral disapprobation for that failure, but not for the cause of it, nor for the errors, merely personal to himself, which may have remotely led to it. In like manner, when a person disables himself, by conduct purely self-regarding, from the performance of some definite duty incumbent on him to the public, he is guilty of a social offence. No person ought to be punished simply for being drunk; but a soldier or a policeman should be punished for being drunk on duty. Whenever, in short, there is a definite damage, or a definite risk of damage, either to an individual or to the public, the case is taken out of the province of liberty, and placed in that of morality or law.

But with regard to the merely contingent or, as it may be called, constructive injury which a person causes to society, by conduct which neither violates any specific duty to the public, nor occasions perceptible hurt to any assignable individual except himself; the inconvenience is one which society can afford to bear, for the sake of the greater good of human freedom. If grown persons are to be punished for not taking proper care of themselves, I would rather it were for their own sake, than under pretence of preventing them from impairing their capacity of rendering to society benefits which society does not pretend it has a right to exact. But I cannot consent to argue the point as if society had no means of bringing its weaker members up to its ordinary standard of rational conduct, except waiting till they do something irrational, and then punishing them, legally or morally, for it. Society has had absolute power over them during all the early portion of their existence: it has had the whole period of childhood and nonage in which to try whether it could make them capable of rational conduct in life. The existing generation is master both of the training and the entire circumstances of the generation to come; it cannot indeed make them perfectly wise and good, because it is itself so lamentably deficient in goodness and wisdom; and its best efforts are not always, in individual cases, its most successful ones; but it is perfectly well able to make the rising generation, as a whole, as good as, and a little better than, itself. If society lets any considerable number of its members grow up mere children, incapable of being

acted on by rational consideration of distant motives, society has itself to blame for the consequences. Armed not only with all the powers of education, but with the ascendency which the authority of a received opinion always exercises over the minds who are least fitted to judge for themselves; and aided by the natural penalties which cannot be prevented from falling on those who incur the distaste or the contempt of those who know them; let not society pretend that it needs, besides all this, the power to issue commands and enforce obedience in the personal concerns of individuals, in which, on all principles of justice and policy, the decision ought to rest with those who are to abide the consequences. Nor is there anything which tends more to discredit and frustrate the better means of influencing conduct, than a resort to the worse. If there be among those whom it is attempted to coerce into prudence or temperance, any of the material of which vigorous and independent characters are made, they will infallibly rebel against the yoke. No such person will ever feel that others have a right to control him in his concerns, such as they have to prevent him from injuring them in theirs; and it easily comes to be considered a mark of spirit and courage to fly in the face of such usurped authority, and do with ostentation the exact opposite of what it enjoins; as in the fashion of grossness which succeeded, in the time of Charles II., to the fanatical moral intolerance of the Puritans. With respect to what is said of the necessity of protecting society from the bad example set to others by the vicious or the self-indulgent; it is true that bad example may have a pernicious effect, especially the example of doing wrong to others with impunity to the wrong-doer. But we are now speaking of conduct which, while it does no wrong to others, is supposed to do great harm to the agent himself: and I do not see how those who believe this, can think otherwise than that the example, on the whole, must be more salutary than hurtful, since, if it displays the misconduct, it displays also the painful or degrading consequences which, if the conduct is justly censured, must be supposed to be in all or most cases attendant on it.

But the strongest of all the arguments against the interference of the public with purely personal conduct, is that when it does interfere, the odds are that it interferes wrongly, and in the wrong place. On questions of social morality, of duty to others, the opinion of the public, that is, of an overruling majority, though often wrong, is likely to be still oftener right; because on such questions they are only required to judge of their own interests; of the manner in which some mode of conduct, if allowed to be practised, would affect themselves. But the opinion of a similar majority, imposed as a law on the minority, on questions of self-regarding conduct, is quite as likely to be wrong as right; for in these cases public opinion means, at the best, some people's opinion of what is good or bad for other people; while very often it does not even mean that; the public, with the most perfect indifference, passing over the pleasure or convenience of those whose conduct they censure, and considering only their own preference. There are many who consider as an injury to themselves any conduct which they have a distaste for, and resent it as an outrage to their feelings; as a religious bigot, when charged with disregarding the religious feelings of others, has been known to retort that they disregard his feelings, by persisting in their abominable worship or creed. But there is no parity between the feeling of a person for his own opinion, and the feeling of another who is offended at his holding it; no more than between the desire of a thief to take a purse, and the desire of the right owner to keep it. And a person's taste is as much his own peculiar concern as his opinion or his purse. It is easy for any one to imagine an ideal public, which leaves the freedom and choice of individuals in all uncertain matters undisturbed, and only requires them to abstain from modes of conduct which universal experience has condemned. But where has there been seen a public which set any such limit to its censorship? or when does the public trouble itself about universal experience. In its interferences with personal conduct it is

seldom thinking of anything but the enormity of acting or feeling differently from itself; and this standard of judgment, thinly disguised, is held up to mankind as the dictate of religion and philosophy, by nine tenths of all moralists and speculative writers. These teach that things are right because they are right; because we feel them to be so. They tell us to search in our own minds and hearts for laws of conduct binding on ourselves and on all others. What can the poor public do but apply these instructions, and make their own personal feelings of good and evil, if they are tolerably unanimous in them, obligatory on all the world?

The evil here pointed out is not one which exists only in theory; and it may perhaps be expected that I should specify the instances in which the public of this age and country improperly invests its own preferences with the character of moral laws. I am not writing an essay on the aberrations of existing moral feeling. That is too weighty a subject to be discussed parenthetically, and by way of illustration. Yet examples are necessary, to show that the principle I maintain is of serious and practical moment, and that I am not endeavoring to erect a barrier against imaginary evils. And it is not difficult to show, by abundant instances, that to extend the bounds of what may be called moral police, until it encroaches on the most unquestionably legitimate liberty of the individual, is one of the most universal of all human propensities.

As a first instance, consider the antipathies which men cherish on no better grounds than that persons whose religious opinions are different from theirs, do not practise their religious observances, especially their religious abstinences. To cite a rather trivial example, nothing in the creed or practice of Christians does more to envenom the hatred of Mahomedans against them, than the fact of their eating pork. There are few acts which Christians and Europeans regard with more unaffected disgust, than Mussulmans regard this particular mode of satisfying hunger. It is, in the first place, an offence against their religion; but this circumstance by no means explains either the degree or the kind of their repugnance; for wine also is forbidden by their religion, and to partake of it is by all Mussulmans accounted wrong, but not disgusting. Their aversion to the flesh of the "unclean beast" is, on the contrary, of that peculiar character, resembling an instinctive antipathy, which the idea of uncleanness, when once it thoroughly sinks into the feelings, seems always to excite even in those whose personal habits are anything but scrupulously cleanly and of which the sentiment of religious impurity, so intense in the Hindoos, is a remarkable example. Suppose now that in a people, of whom the majority were Mussulmans, that majority should insist upon not permitting pork to be eaten within the limits of the country. This would be nothing new in Mahomedan countries.[1] Would it be a legitimate exercise of the moral authority of public opinion? and if not, why not? The practice is really revolting to such a public. They also sincerely think that it is forbidden and abhorred by the Deity. Neither could the prohibition be censured as religious persecution. It might be religious in its origin, but it would not be persecution for religion, since nobody's religion makes it a duty to eat pork. The only tenable ground of condemnation would be, that with the personal tastes and self-regarding concerns of individuals the public has no business to interfere.

To come somewhat nearer home: the majority of Spaniards consider it a gross impiety, offensive in the highest degree to the Supreme Being, to worship him in any other manner than the Roman Catholic; and no other public worship is lawful on Spanish soil. The people of all Southern Europe look upon a married clergy as not only irreligious, but unchaste, indecent, gross, disgusting. What do Protestants think of these perfectly sincere feelings, and of the attempt to enforce them against non-Catholics? Yet, if mankind are justified in interfering with each other's liberty in things which do not concern the interests of others, on what principle is it possible consistently to exclude these

cases? or who can blame people for desiring to suppress what they regard as a scandal in the sight of God and man?

No stronger case can be shown for prohibiting anything which is regarded as a personal immorality, than is made out for suppressing these practices in the eyes of those who regard them as impieties; and unless we are willing to adopt the logic of persecutors, and to say that we may persecute others because we are right, and that they must not persecute us because they are wrong, we must beware of admitting a principle of which we should resent as a gross injustice the application to ourselves.

The preceding instances may be objected to, although unreasonably, as drawn from contingencies impossible among us: opinion, in this country, not being likely to enforce abstinence from meats, or to interfere with people for worshipping, and for either marrying or not marrying, according to their creed or inclination. The next example, however, shall be taken from an interference with liberty which we have by no means passed all danger of. Wherever the Puritans have been sufficiently powerful, as in New England, and in Great Britain at the time of the Commonwealth, they have endeavored, with considerable success, to put down all public, and nearly all private, amusements: especially music, dancing, public games, or other assemblages for purposes of diversion, and the theatre. There are still in this country large bodies of persons by whose notions of morality and religion these recreations are condemned; and those persons belonging chiefly to the middle class, who are the ascendant power in the present social and political condition of the kingdom, it is by no means impossible that persons of these sentiments may at some time or other command a majority in Parliament. How will the remaining portion of the community like to have the amusements that shall be permitted to them regulated by the religious and moral sentiments of the stricter Calvinists and Methodists? Would they not, with considerable peremptoriness, desire these intrusively pious members of society to mind their own business? This is precisely what should be said to every government and every public, who have the pretension that no person shall enjoy any pleasure which they think wrong. But if the principle of the pretension be admitted, no one can reasonably object to its being acted on in the sense of the majority, or other preponderating power in the country; and all persons must be ready to conform to the idea of a Christian commonwealth, as understood by the early settlers in New England, if a religious profession similar to theirs should ever succeed in regaining its lost ground, as religions supposed to be declining have so often been known to do.

To imagine another contingency, perhaps more likely to be realized than the one last mentioned. There is confessedly a strong tendency in the modern world towards a democratic constitution of society, accompanied or not by popular political institutions. It is affirmed that in the country where this tendency is most completely realized -- where both society and the government are most democratic -- the United States -- the feeling of the majority, to whom any appearance of a more showy or costly style of living than they can hope to rival is disagreeable, operates as a tolerably effectual sumptuary law, and that in many parts of the Union it is really difficult for a person possessing a very large income, to find any mode of spending it, which will not incur popular disapprobation. Though such statements as these are doubtless much exaggerated as a representation of existing facts, the state of things they describe is not only a conceivable and possible, but a probable result of democratic feeling, combined with the notion that the public has a right to a veto on the manner in which individuals shall spend their incomes. We have only further to suppose a considerable diffusion of Socialist opinions, and it may become infamous in the eyes of the majority to possess more property than some very small amount, or any income not

earned by manual labor. Opinions similar in principle to these, already prevail widely among the artisan class, and weigh oppressively on those who are amenable to the opinion chiefly of that class, namely, its own members. It is known that the bad workmen who form the majority of the operatives in many branches of industry, are decidedly of opinion that bad workmen ought to receive the same wages as good, and that no one ought to be allowed, through piecework or otherwise, to earn by superior skill or industry more than others can without it. And they employ a moral police, which occasionally becomes a physical one, to deter skilful workmen from receiving, and employers from giving, a larger remuneration for a more useful service. If the public have any jurisdiction over private concerns, I cannot see that these people are in fault, or that any individual's particular public can be blamed for asserting the same authority over his individual conduct, which the general public asserts over people in general.

But, without dwelling upon supposititious cases, there are, in our own day, gross usurpations upon the liberty of private life actually practised, and still greater ones threatened with some expectation of success, and opinions proposed which assert an unlimited right in the public not only to prohibit by law everything which it thinks wrong, but in order to get at what it thinks wrong, to prohibit any number of things which it admits to be innocent.

Under the name of preventing intemperance the people of one English colony, and of nearly half the United States, have been interdicted by law from making any use whatever of fermented drinks, except for medical purposes: for prohibition of their sale is in fact, as it is intended to be, prohibition of their use. And though the impracticability of executing the law has caused its repeal in several of the States which had adopted it, including the one from which it derives its name, an attempt has notwithstanding been commenced, and is prosecuted with considerable zeal by many of the professed philanthropists, to agitate for a similar law in this country. The association, or "Alliance" as it terms itself, which has been formed for this purpose, has acquired some notoriety through the publicity given to a correspondence between its Secretary and one of the very few English public men who hold that a politician's opinions ought to be founded on principles. Lord Stanley's share in this correspondence is calculated to strengthen the hopes already built on him, by those who know how rare such qualities as are manifested in some of his public appearances, unhappily are among those who figure in political life. The organ of the Alliance, who would "deeply deplore the recognition of any principle which could be wrested to justify bigotry and persecution," undertakes to point out the "broad and impassable barrier" which divides such principles from those of the association. "All matters relating to thought, opinion, conscience, appear to me," he says, "to be without the sphere of legislation; all pertaining to social act, habit, relation, subject only to a discretionary power vested in the State itself, and not in the individual, to be within it." No mention is made of a third class, different from either of these, viz., acts and habits which are not social, but individual; although it is to this class, surely, that the act of drinking fermented liquors belongs. Selling fermented liquors, however, is trading, and trading is a social act. But the infringement complained of is not on the liberty of the seller, but on that of the buyer and consumer; since the State might just as well forbid him to drink wine, as purposely make it impossible for him to obtain it. The Secretary, however, says, "I claim, as a citizen, a right to legislate whenever my social rights are invaded by the social act of another." And now for the definition of these "social rights." "If anything invades my social rights, certainly the traffic in strong drink does. It destroys my primary right of security, by constantly creating and stimulating social disorder. It invades my right of equality, by deriving a profit from the creation of a misery, I am taxed to support. It impedes my right to free moral and intellectual development, by

surrounding my path with dangers, and by weakening and demoralizing society, from which I have a right to claim mutual aid and intercourse." A theory of "social rights," the like of which probably never before found its way into distinct language -- being nothing short of this -- that it is the absolute social right of every individual, that every other individual shall act in every respect exactly as he ought; that whosoever fails thereof in the smallest particular, violates my social right, and entitles me to demand from the legislature the removal of the grievance. So monstrous a principle is far more dangerous than any single interference with liberty; there is no violation of liberty which it would not justify; it acknowledges no right to any freedom whatever, except perhaps to that of holding opinions in secret, without ever disclosing them; for the moment an opinion which I consider noxious, passes any one's lips, it invades all the "social rights" attributed to me by the Alliance. The doctrine ascribes to all mankind a vested interest in each other's moral, intellectual, and even physical perfection, to be defined by each claimant according to his own standard.

Another important example of illegitimate interference with the rightful liberty of the individual, not simply threatened, but long since carried into triumphant effect, is Sabbatarian legislation. Without doubt, abstinence on one day in the week, so far as the exigencies of life permit, from the usual daily occupation, though in no respect religiously binding on any except Jews, is a highly beneficial custom. And inasmuch as this custom cannot be observed without a general consent to that effect among the industrious classes, therefore, in so far as some persons by working may impose the same necessity on others, it may be allowable and right that the law should guarantee to each, the observance by others of the custom, by suspending the greater operations of industry on a particular day. But this justification, grounded on the direct interest which others have in each individual's observance of the practice, does not apply to the self-chosen occupations in which a person may think fit to employ his leisure; nor does it hold good, in the smallest degree, for legal restrictions on amusements. It is true that the amusement of some is the day's work of others; but the pleasure, not to say the useful recreation, of many, is worth the labor of a few, provided the occupation is freely chosen, and can be freely resigned. The operatives are perfectly right in thinking that if all worked on Sunday, seven days' work would have to be given for six days' wages: but so long as the great mass of employments are suspended, the small number who for the enjoyment of others must still work, obtain a proportional increase of earnings; and they are not obliged to follow those occupations, if they prefer leisure to emolument. If a further remedy is sought, it might be found in the establishment by custom of a holiday on some other day of the week for those particular classes of persons. The only ground, therefore, on which restrictions on Sunday amusements can be defended, must be that they are religiously wrong; a motive of legislation which never can be too earnestly protested against. "Deorum injuriae Diis curae." It remains to be proved that society or any of its officers holds a commission from on high to avenge any supposed offence to Omnipotence, which is not also a wrong to our fellow-creatures. The notion that it is one man's duty that another should be religious, was the foundation of all the religious persecutions ever perpetrated, and if admitted, would fully justify them. Though the feeling which breaks out in the repeated attempts to stop railway travelling on Sunday, in the resistance to the opening of Museums, and the like, has not the cruelty of the old persecutors, the state of mind indicated by it is fundamentally the same. It IS a determination not to tolerate others in doing what is permitted by their religion, because it is not permitted by the persecutor's religion. It is a belief that God not only abominates the act of the misbeliever, but will not hold us guiltless if we leave him unmolested.

I cannot refrain from adding to these examples of the little account commonly made of human liberty, the language of downright persecution which breaks out from the press of this country, whenever it feels called on to notice the remarkable phenomenon of Mormonism. Much might be said on the unexpected and instructive fact, that an alleged new revelation, and a religion, founded on it, the product of palpable imposture, not even supported by the prestige of extraordinary qualities in its founder, is believed by hundreds of thousands, and has been made the foundation of a society, in the age of newspapers, railways, and the electric telegraph. What here concerns us is, that this religion, like other and better religions, has its martyrs; that its prophet and founder was, for his teaching, put to death by a mob; that others of its adherents lost their lives by the same lawless violence; that they were forcibly expelled, in a body, from the country in which they first grew up; while, now that they have been chased into a solitary recess in the midst of a desert, many in this country openly declare that it would be right (only that it is not convenient) to send an expedition against them, and compel them by force to conform to the opinions of other people. The article of the Mormonite doctrine which is the chief provocative to the antipathy which thus breaks through the ordinary restraints of religious tolerance, is its sanction of polygamy; which, though permitted to Mahomedans, and Hindoos, and Chinese, seems to excite unquenchable animosity when practised by persons who speak English, and profess to be a kind of Christians. No one has a deeper disapprobation than I have of this Mormon institution; both for other reasons, and because, far from being in any way countenanced by the principle of liberty, it is a direct infraction of that principle, being a mere riveting of the chains of one half of the community, and an emancipation of the other from reciprocity of obligation towards them. Still, it must be remembered that this relation is as much voluntary on the part of the women concerned in it, and who may be deemed the sufferers by it, as is the case with any other form of the marriage institution; and however surprising this fact may appear, it has its explanation in the common ideas and customs of the world, which teaching women to think marriage the one thing needful, make it intelligible that many a woman should prefer being one of several wives, to not being a wife at all. Other countries are not asked to recognize such unions, or release any portion of their inhabitants from their own laws on the score of Mormonite opinions. But when the dissentients have conceded to the hostile sentiments of others, far more than could justly be demanded; when they have left the countries to which their doctrines were unacceptable, and established themselves in a remote corner of the earth, which they have been the first to render habitable to human beings; it is difficult to see on what principles but those of tyranny they can be prevented from living there under what laws they please, provided they commit no aggression on other nations, and allow perfect freedom of departure to those who are dissatisfied with their ways. A recent writer, in some respects of considerable merit, proposes (to use his own words,) not a crusade, but a civilizade, against this polygamous community, to put an end to what seems to him a retrograde step in civilization. It also appears so to me, but I am not aware that any community has a right to force another to be civilized. So long as the sufferers by the bad law do not invoke assistance from other communities, I cannot admit that persons entirely unconnected with them ought to step in and require that a condition of things with which all who are directly interested appear to be satisfied, should be put an end to because it is a scandal to persons some thousands of miles distant, who have no part or concern in it. Let them send missionaries, if they please, to preach against it; and let them, by any fair means, (of which silencing the teachers is not one,) oppose the progress of similar doctrines among their own people. If civilization has got the better of barbarism when barbarism had the world to itself, it is too much to profess to be afraid lest barbarism, after having been fairly got under, should revive and conquer civilization. A civilization that can thus succumb to its

vanquished enemy must first have become so degenerate, that neither its appointed priests and teachers, nor anybody else, has the capacity, or will take the trouble, to stand up for it. If this be so, the sooner such a civilization receives notice to quit, the better. It can only go on from bad to worse, until destroyed and regenerated (like the Western Empire) by energetic barbarians.

[1] The case of the Bombay Parsees is a curious instance in point. When this industrious and enterprising tribe, the descendants of the Persian fireworshippers, flying from their native country before the Caliphs, arrived in Western India, they were admitted to toleration by the Hindoo sovereigns, on condition of not eating beef. When those regions afterwards fell under the dominion of Mahomedan conquerors, the Parsees obtained from them a continuance of indulgence, on condition of refraining from pork. What was at first obedience to authority became a second nature, and the Parsees to this day abstain both from beef and pork. Though not required by their religion, the double abstinence has had time to grow into a custom of their tribe; and custom, in the East, is a religion.

Chapter V: Applications

The principles asserted in these pages must be more generally admitted as the basis for discussion of details, before a consistent application of them to all the various departments of government and morals can be attempted with any prospect of advantage. The few observations I propose to make on questions of detail, are designed to illustrate the principles, rather than to follow them out to their consequences. I offer, not so much applications, as specimens of application; which may serve to bring into greater clearness the meaning and limits of the two maxims which together form the entire doctrine of this Essay and to assist the judgment in holding the balance between them, in the cases where it appears doubtful which of them is applicable to the case.

The maxims are, first, that the individual is not accountable to society for his actions, in so far as these concern the interests of no person but himself. Advice, instruction, persuasion, and avoidance by other people, if thought necessary by them for their own good, are the only measures by which society can justifiably express its dislike or disapprobation of his conduct. Secondly, that for such actions as are prejudicial to the interests of others, the individual is accountable, and may be subjected either to social or to legal punishments, if society is of opinion that the one or the other is requisite for its protection.

In the first place, it must by no means be supposed, because damage, or probability of damage, to the interests of others, can alone justify the interference of society, that therefore it always does justify such interference. In many cases, an individual, in pursuing a legitimate object, necessarily and therefore legitimately causes pain or loss to others, or intercepts a good which they had a reasonable hope of obtaining. Such oppositions of interest between individuals often arise from bad social institutions, but are unavoidable while those institutions last; and some would be unavoidable under any institutions. Whoever succeeds in an overcrowded profession, or in a competitive examination; whoever is preferred to another in any contest for an object which both desire, reaps benefit from the loss of others, from their wasted exertion and their disappointment. But it is, by common admission, better for the general interest of mankind, that persons should pursue their objects undeterred by this sort of consequences. In other words, society admits no right, either legal or moral, in the disappointed competitors, to immunity from this kind of suffering; and feels called on to interfere, only when means of success have been employed which it is contrary to the general interest to permit -- namely, fraud or treachery, and force.

Again, trade is a social act. Whoever undertakes to sell any description of goods to the public, does what affects the interest of other persons, and of society in general; and thus his conduct, in

principle, comes within the jurisdiction of society: accordingly, it was once held to be the duty of governments, in all cases which were considered of importance, to fix prices, and regulate the processes of manufacture. But it is now recognized, though not till after a long struggle, that both the cheapness and the good quality of commodities are most effectually provided for by leaving the producers and sellers perfectly free, under the sole check of equal freedom to the buyers for supplying themselves elsewhere. This is the so-called doctrine of Free Trade, which rests on grounds different from, though equally solid with, the principle of individual liberty asserted in this Essay. Restrictions on trade, or on production for purposes of trade, are indeed restraints; and all restraint, qua restraint, is an evil: but the restraints in question affect only that part of conduct which society is competent to restrain, and are wrong solely because they do not really produce the results which it is desired to produce by them. As the principle of individual liberty is not involved in the doctrine of Free Trade so neither is it in most of the questions which arise respecting the limits of that doctrine: as for example, what amount of public control is admissible for the prevention of fraud by adulteration; how far sanitary precautions, or arrangements to protect work-people employed in dangerous occupations, should be enforced on employers. Such questions involve considerations of liberty, only in so far as leaving people to themselves is always better, caeteris paribus, than controlling them: but that they may be legitimately controlled for these ends, is in principle undeniable. On the other hand, there are questions relating to interference with trade which are essentially questions of liberty; such as the Maine Law, already touched upon; the prohibition of the importation of opium into China; the restriction of the sale of poisons; all cases, in short, where the object of the interference is to make it impossible or difficult to obtain a particular commodity. These interferences are objectionable, not as infringements on the liberty of the producer or seller, but on that of the buyer.

One of these examples, that of the sale of poisons, opens a new question; the proper limits of what may be called the functions of police; how far liberty may legitimately be invaded for the prevention of crime, or of accident. It is one of the undisputed functions of government to take precautions against crime before it has been committed, as well as to detect and punish it afterwards. The preventive function of government, however, is far more liable to be abused, to the prejudice of liberty, than the punitory function; for there is hardly any part of the legitimate freedom of action of a human being which would not admit of being represented, and fairly too, as increasing the facilities for some form or other of delinquency. Nevertheless, if a public authority, or even a private person, sees any one evidently preparing to commit a crime, they are not bound to look on inactive until the crime is committed, but may interfere to prevent it. If poisons were never bought or used for any purpose except the commission of murder, it would be right to prohibit their manufacture and sale. They may, however, be wanted not only for innocent but for useful purposes, and restrictions cannot be imposed in the one case without operating in the other. Again, it is a proper office of public authority to guard against accidents. If either a public officer or any one else saw a person attempting to cross a bridge which had been ascertained to be unsafe, and there were no time to warn him of his danger, they might seize him and turn him back without any real infringement of his liberty; for liberty consists in doing what one desires, and he does not desire to fall into the river. Nevertheless, when there is not a certainty, but only a danger of mischief, no one but the person himself can judge of the sufficiency of the motive which may prompt him to incur the risk: in this case, therefore, (unless he is a child, or delirious, or in some state of excitement or absorption incompatible with the full use of the reflecting faculty,) he ought, I conceive, to be only warned of the danger; not forcibly prevented from exposing himself to it.

Similar considerations, applied to such a question as the sale of poisons, may enable us to decide which among the possible modes of regulation are or are not contrary to principle. Such a precaution, for example, as that of labelling the drug with some word expressive of its dangerous character, may be enforced without violation of liberty: the buyer cannot wish not to know that the thing he possesses has poisonous qualities. But to require in all cases the certificate of a medical practitioner, would make it sometimes impossible, always expensive, to obtain the article for legitimate uses. The only mode apparent to me, in which difficulties may be thrown in the way of crime committed through this means, without any infringement, worth taking into account, Upon the liberty of those who desire the poisonous substance for other purposes, consists in providing what, in the apt language of Bentham, is called "preappointed evidence." This provision is familiar to every one in the case of contracts. It is usual and right that the law, when a contract is entered into, should require as the condition of its enforcing performance, that certain formalities should be observed, such as signatures, attestation of witnesses, and the like, in order that in case of subsequent dispute, there may be evidence to prove that the contract was really entered into, and that there was nothing in the circumstances to render it legally invalid: the effect being, to throw great obstacles in the way of fictitious contracts, or contracts made in circumstances which, if known, would destroy their validity. Precautions of a similar nature might be enforced in the sale of articles adapted to be instruments of crime. The seller, for example, might be required to enter in a register the exact time of the transaction, the name and address of the buyer, the precise quality and quantity sold; to ask the purpose for which it was wanted, and record the answer he received. When there was no medical prescription, the presence of some third person might be required, to bring home the fact to the purchaser, in case there should afterwards be reason to believe that the article had been applied to criminal purposes. Such regulations would in general be no material impediment to obtaining the article, but a very considerable one to making an improper use of it without detection.

The right inherent in society, to ward off crimes against itself by antecedent precautions, suggests the obvious limitations to the maxim, that purely self-regarding misconduct cannot properly be meddled with in the way of prevention or punishment. Drunkennesses, for example, in ordinary cases, is not a fit subject for legislative interference; but I should deem it perfectly legitimate that a person, who had once been convicted of any act of violence to others under the influence of drink, should be placed under a special legal restriction, personal to himself; that if he were afterwards found drunk, he should be liable to a penalty, and that if when in that state he committed another offence, the punishment to which he would be liable for that other offence should be increased in severity. The making himself drunk, in a person whom drunkenness excites to do harm to others, is a crime against others. So, again, idleness, except in a person receiving support from the public, or except when it constitutes a breach of contract, cannot without tyranny be made a subject of legal punishment; but if either from idleness or from any other avoidable cause, a man fails to perform his legal duties to others, as for instance to support his children, it is no tyranny to force him to fulfil that obligation, by compulsory labor, if no other means are available.

Again, there are many acts which, being directly injurious only to the agents themselves, ought not to be legally interdicted, but which, if done publicly, are a violation of good manners, and coming thus within the category of offences against others, may rightfully be prohibited. Of this kind are offences against decency; on which it is unnecessary to dwell, the rather as they are only connected indirectly with our subject, the objection to publicity being equally strong in the case of many actions not in themselves condemnable, nor supposed to be so.

There is another question to which an answer must be found, consistent with the principles which have been laid down. In cases of personal conduct supposed to be blameable, but which respect for liberty precludes society from preventing or punishing, because the evil directly resulting falls wholly on the agent; what the agent is free to do, ought other persons to be equally free to counsel or instigate? This question is not free from difficulty. The case of a person who solicits another to do an act, is not strictly a case of self-regarding conduct. To give advice or offer inducements to any one, is a social act, and may therefore, like actions in general which affect others, be supposed amenable to social control. But a little reflection corrects the first impression, by showing that if the case is not strictly within the definition of individual liberty, yet the reasons on which the principle of individual liberty is grounded, are applicable to it. If people must be allowed, in whatever concerns only themselves, to act as seems best to themselves at their own peril, they must equally be free to consult with one another about what is fit to be so done; to exchange opinions, and give and receive suggestions. Whatever it is permitted to do, it must be permitted to advise to do. The question is doubtful, only when the instigator derives a personal benefit from his advice; when he makes it his occupation, for subsistence, or pecuniary gain, to promote what society and the State consider to be an evil. Then, indeed, a new element of complication is introduced; namely, the existence of classes of persons with an interest opposed to what is considered as the public weal, and whose mode of living is grounded on the counteraction of it. Ought this to be interfered with, or not? Fornication, for example, must be tolerated, and so must gambling; but should a person be free to be a pimp, or to keep a gambling-house? The case is one of those which lie on the exact boundary line between two principles, and it is not at once apparent to which of the two it properly belongs. There are arguments on both sides. On the side of toleration it may be said, that the fact of following anything as an occupation, and living or profiting by the practice of it, cannot make that criminal which would otherwise be admissible; that the act should either be consistently permitted or consistently prohibited; that if the principles which we have hitherto defended are true, society has no business, as society, to decide anything to be wrong which concerns only the individual; that it cannot go beyond dissuasion, and that one person should be as free to persuade, as another to dissuade. In opposition to this it may be contended, that although the public, or the State, are not warranted in authoritatively deciding, for purposes of repression or punishment, that such or such conduct affecting only the interests of the individual is good or bad, they are fully justified in assuming, if they regard it as bad, that its being so or not is at least a disputable question: That, this being supposed, they cannot be acting wrongly in endeavoring to exclude the influence of solicitations which are not disinterested, of instigators who cannot possibly be impartial -- who have a direct personal interest on one side, and that side the one which the State believes to be wrong, and who confessedly promote it for personal objects only. There can surely, it may be urged, be nothing lost, no sacrifice of good, by so ordering matters that persons shall make their election, either wisely or foolishly, on their own prompting, as free as possible from the arts of persons who stimulate their inclinations for interested purposes of their own. Thus (it may be said) though the statutes respecting unlawful games are utterly indefensible -- though all persons should be free to gamble in their own or each other's houses, or in any place of meeting established by their own subscriptions, and open only to the members and their visitors -- yet public gambling-houses should not be permitted. It is true that the prohibition is never effectual, and that whatever amount of tyrannical power is given to the police, gamblinghouses can always be maintained under other pretences; but they may be compelled to conduct their operations with a certain degree of secrecy and mystery, so that nobody knows anything about them but those who seek them; and more than this society ought not to aim at. There is considerable force in these

arguments. I will not venture to decide whether they are sufficient to justify the moral anomaly of punishing the accessary, when the principal is (and must be) allowed to go free; of fining or imprisoning the procurer, but not the fornicator, the gambling-house keeper, but not the gambler. Still less ought the common operations of buying and selling to be interfered with on analogous grounds. Almost every article which is bought and sold may be used in excess, and the sellers have a pecuniary interest in encouraging that excess; but no argument can be founded on this, in favor, for instance, of the Maine Law; because the class of dealers in strong drinks, though interested in their abuse, are indispensably required for the sake of their legitimate use. The interest, however, of these dealers in promoting intemperance is a real evil, and justifies the State in imposing restrictions and requiring guarantees, which but for that justification would be infringements of legitimate liberty.

A further question is, whether the State while it permits, should nevertheless indirectly discourage conduct which it deems contrary to the best interests of the agent; whether, for example, it should take measures to render the means of drunkenness more costly, or add to the difficulty of procuring them, by limiting the number of the places of sale. On this as on most other practical questions, many distinctions require to be made. To tax stimulants for the sole purpose of making them more difficult to be obtained, is a measure differing only in degree from their entire prohibition; and would be justifiable only if that were justifiable. Every increase of cost is a prohibition, to those whose means do not come up to the augmented price; and to those who do, it is a penalty laid on them for gratifying a particular taste. Their choice of pleasures, and their mode of expending their income, after satisfying their legal and moral obligations to the State and to individuals, are their own concern, and must rest with their own judgment. These considerations may seem at first sight to condemn the selection of stimulants as special subjects of taxation for purposes of revenue. But it must be remembered that taxation for fiscal purposes is absolutely inevitable; that in most countries it is necessary that a considerable part of that taxation should be indirect; that the State, therefore, cannot help imposing penalties, which to some persons may be prohibitory, on the use of some articles of consumption. It is hence the duty of the State to consider, in the imposition of taxes, what commodities the consumers can best spare; and a fortiori, to select in preference those of which it deems the use, beyond a very moderate quantity, to be positively injurious. Taxation, therefore, of stimulants, up to the point which produces the largest amount of revenue (supposing that the State needs all the revenue which it yields) is not only admissible, but to be approved of.

The question of making the sale of these commodities a more or less exclusive privilege, must be answered differently, according to the purposes to which the restriction is intended to be subservient. All places of public resort require the restraint of a police, and places of this kind peculiarly, because offences against society are especially apt to originate there. It is, therefore, fit to confine the power of selling these commodities (at least for consumption on the spot) to persons of known or vouched-for respectability of conduct; to make such regulations respecting hours of opening and closing as may be requisite for public surveillance, and to withdraw the license if breaches of the peace repeatedly take place through the connivance or incapacity of the keeper of the house, or if it becomes a rendezvous for concocting and preparing offences against the law. Any further restriction I do not conceive to be, in principle, justifiable. The limitation in number, for instance, of beer and spirit-houses, for the express purpose of rendering them more difficult of access, and diminishing the occasions of temptation, not only exposes all to an inconvenience because there are some by whom the facility would be abused, but is suited only to a state of society

in which the laboring classes are avowedly treated as children or savages, and placed under an education of restraint, to fit them for future admission to the privileges of freedom. This is not the principle on which the laboring classes are professedly governed in any free country; and no person who sets due value on freedom will give his adhesion to their being so governed, unless after all efforts have been exhausted to educate them for freedom and govern them as freemen, and it has been definitively proved that they can only be governed as children. The bare statement of the alternative shows the absurdity of supposing that such efforts have been made in any case which needs be considered here. It is only because the institutions of this country are a mass of inconsistencies, that things find admittance into our practice which belong to the system of despotic, or what is called paternal, government, while the general freedom of our institutions precludes the exercise of the amount of control necessary to render the restraint of any real efficacy as a moral education.

It was pointed out in an early part of this Essay, that the liberty of the individual, in things wherein the individual is alone concerned, implies a corresponding liberty in any number of individuals to regulate by mutual agreement such things as regard them jointly, and regard no persons but themselves. This question presents no difficulty, so long as the will of all the persons implicated remains unaltered; but since that will may change, it is often necessary, even in things in which they alone are concerned, that they should enter into engagements with one another; and when they do, it is fit, as a general rule, that those engagements should be kept. Yet in the laws probably, of every country, this general rule has some exceptions. Not only persons are not held to engagements which violate the rights of third parties, but it is sometimes considered a sufficient reason for releasing them from an engagement, that it is injurious to themselves. In this and most other civilized countries, for example, an engagement by which a person should sell himself, or allow himself to be sold, as a slave, would be null and void; neither enforced by law nor by opinion. The ground for thus limiting his power of voluntarily disposing of his own lot in life, is apparent, and is very clearly seen in this extreme case. The reason for not interfering, unless for the sake of others, with a person's voluntary acts, is consideration for his liberty. His voluntary choice is evidence that what he so chooses is desirable, or at the least endurable, to him, and his good is on the whole best provided for by allowing him to take his own means of pursuing it. But by selling himself for a slave, he abdicates his liberty; he foregoes any future use of it, beyond that single act. He therefore defeats, in his own case, the very purpose which is the justification of allowing him to dispose of himself. He is no longer free; but is thenceforth in a position which has no longer the presumption in its favor, that would be afforded by his voluntarily remaining in it. The principle of freedom cannot require that he should be free not to be free. It is not freedom, to be allowed to alienate his freedom. These reasons, the force of which is so conspicuous in this peculiar case, are evidently of far wider application; yet a limit is everywhere set to them by the necessities of life, which continually require, not indeed that we should resign our freedom, but that we should consent to this and the other limitation of it. The principle, however, which demands uncontrolled freedom of action in all that concerns only the agents themselves, requires that those who have become bound to one another, in things which concern no third party, should be able to release one another from the engagement: and even without such voluntary release, there are perhaps no contracts or engagements, except those that relate to money or money's worth, of which one can venture to say that there ought to be no liberty whatever of retractation. Baron Wilhelm von Humboldt, in the excellent Essay from which I have already quoted, states it as his conviction, that engagements which involve personal relations or services, should never be legally binding beyond a

limited duration of time; and that the most important of these engagements, marriage, having the peculiarity that its objects are frustrated unless the feelings of both the parties are in harmony with it, should require nothing more than the declared will of either party to dissolve it. This subject is too important, and too complicated, to be discussed in a parenthesis, and I touch on it only so far as is necessary for purposes of illustration. If the conciseness and generality of Baron Humboldt's dissertation had not obliged him in this instance to content himself with enunciating his conclusion without discussing the premises, he would doubtless have recognized that the question cannot be decided on grounds so simple as those to which he confines himself. When a person, either by express promise or by conduct, has encouraged another to rely upon his continuing to act in a certain way -- to build expectations and calculations, and stake any part of his plan of life upon that supposition, a new series of moral obligations arises on his part towards that person, which may possibly be overruled, but can not be ignored. And again, if the relation between two contracting parties has been followed by consequences to others; if it has placed third parties in any peculiar position, or, as in the case of marriage, has even called third parties into existence, obligations arise on the part of both the contracting parties towards those third persons, the fulfilment of which, or at all events, the mode of fulfilment, must be greatly affected by the continuance or disruption of the relation between the original parties to the contract. It does not follow, nor can I admit, that these obligations extend to requiring the fulfilment of the contract at all costs to the happiness of the reluctant party; but they are a necessary element in the question; and even if, as Von Humboldt maintains, they ought to make no difference in the legal freedom of the parties to release themselves from the engagement (and I also hold that they ought not to make much difference), they necessarily make a great difference in the moral freedom. A person is bound to take all these circumstances into account, before resolving on a step which may affect such important interests of others; and if he does not allow proper weight to those interests, he is morally responsible for the wrong. I have made these obvious remarks for the better illustration of the general principle of liberty, and not because they are at all needed on the particular question, which, on the contrary, is usually discussed as if the interest of children was everything, and that of grown persons nothing.

I have already observed that, owing to the absence of any recognized general principles, liberty is often granted where it should be withheld, as well as withheld where it should be granted; and one of the cases in which, in the modern European world, the sentiment of liberty is the strongest, is a case where, in my view, it is altogether misplaced. A person should be free to do as he likes in his own concerns; but he ought not to be free to do as he likes in acting for another under the pretext that the affairs of another are his own affairs. The State, while it respects the liberty of each in what specially regards himself, is bound to maintain a vigilant control over his exercise of any power which it allows him to possess over others. This obligation is almost entirely disregarded in the case of the family relations, a case, in its direct influence on human happiness, more important than all the others taken together. The almost despotic power of husbands over wives needs not be enlarged upon here, because nothing more is needed for the complete removal of the evil, than that wives should have the same rights, and should receive the protection of law in the same manner, as all other persons; and because, on this subject, the defenders of established injustice do not avail themselves of the plea of liberty, but stand forth openly as the champions of power. It is in the case of children, that misapplied notions of liberty are a real obstacle to the fulfilment by the State of its duties. One would almost think that a man's children were supposed to be literally, and not metaphorically, a part of himself, so jealous is opinion of the smallest interference of law with his

absolute and exclusive control over them; more jealous than of almost any interference with his own freedom of action: so much less do the generality of mankind value liberty than power. Consider, for example, the case of education. Is it not almost a selfevident axiom, that the State should require and compel the education, up to a certain standard, of every human being who is born its citizen? Yet who is there that is not afraid to recognize and assert this truth? Hardly any one indeed will deny that it is one of the most sacred duties of the parents (or, as law and usage now stand, the father), after summoning a human being into the world, to give to that being an education fitting him to perform his part well in life towards others and towards himself. But while this is unanimously declared to be the father's duty, scarcely anybody, in this country, will bear to hear of obliging him to perform it. Instead of his being required to make any exertion or sacrifice for securing education to the child, it is left to his choice to accept it or not when it is provided gratis! It still remains unrecognized, that to bring a child into existence without a fair prospect of being able, not only to provide food for its body, but instruction and training for its mind, is a moral crime, both against the unfortunate offspring and against society; and that if the parent does not fulfil this obligation, the State ought to see it fulfilled, at the charge, as far as possible, of the parent.

Were the duty of enforcing universal education once admitted, there would be an end to the difficulties about what the State should teach, and how it should teach, which now convert the subject into a mere battle-field for sects and parties, causing the time and labor which should have been spent in educating, to be wasted in quarrelling about education. If the government would make up its mind to require for every child a good education, it might save itself the trouble of providing one. It might leave to parents to obtain the education where and how they pleased, and content itself with helping to pay the school fees of the poorer classes of children, and defraying the entire school expenses of those who have no one else to pay for them. The objections which are urged with reason against State education, do not apply to the enforcement of education by the State, but to the State's taking upon itself to direct that education: which is a totally different thing. That the whole or any large part of the education of the people should be in State hands, I go as far as any one in deprecating. All that has been said of the importance of individuality of character, and diversity in opinions and modes of conduct, involves, as of the same unspeakable importance, diversity of education. A general State education is a mere contrivance for moulding people to be exactly like one another: and as the mould in which it casts them is that which pleases the predominant power in the government, whether this be a monarch, a priesthood, an aristocracy, or the majority of the existing generation, in proportion as it is efficient and successful, it establishes a despotism over the mind, leading by natural tendency to one over the body. An education established and controlled by the State, should only exist, if it exist at all, as one among many competing experiments, carried on for the purpose of example and stimulus, to keep the others up to a certain standard of excellence. Unless, indeed, when society in general is in so backward a state that it could not or would not provide for itself any proper institutions of education, unless the government undertook the task; then, indeed, the government may, as the less of two great evils, take upon itself the business of schools and universities, as it may that of joint-stock companies, when private enterprise, in a shape fitted for undertaking great works of industry does not exist in the country. But in general, if the country contains a sufficient number of persons qualified to provide education under government auspices, the same persons would be able and willing to give an equally good education on the voluntary principle, under the assurance of remuneration afforded by a law rendering education compulsory, combined with State aid to those unable to

defray the expense.

The instrument for enforcing the law could be no other than public examinations, extending to all children, and beginning at an early age. An age might be fixed at which every child must be examined, to ascertain if he (or she) is able to read. If a child proves unable, the father, unless he has some sufficient ground of excuse, might be subjected to a moderate fine, to be worked out, if necessary, by his labor, and the child might be put to school at his expense. Once in every year the examination should be renewed, with a gradually extending range of subjects, so as to make the universal acquisition, and what is more, retention, of a certain minimum of general knowledge, virtually compulsory. Beyond that minimum, there should be voluntary examinations on all subjects, at which all who come up to a certain standard of proficiency might claim a certificate. To prevent the State from exercising through these arrangements, an improper influence over opinion, the knowledge required for passing an examination (beyond the merely instrumental parts of knowledge, such as languages and their use) should, even in the higher class of examinations, be confined to facts and positive science exclusively. The examinations on religion, politics, or other disputed topics, shouLd not turn on the truth or falsehood of opinions, but on the matter of fact that such and such an opinion is held, on such grounds, by such authors, or schools, or churches. Under this system, the rising generation would be no worse off in regard to all disputed truths, than they are at present; they would be brought up either churchmen or dissenters as they now are, the State merely taking care that they should be instructed churchmen, or instructed dissenters. There would be nothing to hinder them from being taught religion, if their parents chose, at the same schools where they were taught other things. All attempts by the State to bias the conclusions of its citizens on disputed subjects, are evil; but it may very properly offer to ascertain and certify that a person possesses the knowledge requisite to make his conclusions, on any given subject, worth attending to. A student of philosophy would be the better for being able to stand an examination both in Locke and in Kant, whichever of the two he takes up with, or even if with neither: and there is no reasonable objection to examining an atheist in the evidences of Christianity, provided he is not required to profess a belief in them. The examinations, however, in the higher branches of knowledge should, I conceive, be entirely voluntary. It would be giving too dangerous a power to governments, were they allowed to exclude any one from professions, even from the profession of teacher, for alleged deficiency of qualifications: and I think, with Wilhelm von Humboldt, that degrees, or other public certificates of scientific or professional acquirements, should be given to all who present themselves for examination, and stand the test; but that such certificates should confer no advantage over competitors, other than the weight which may be attached to their testimony by public opinion.

It is not in the matter of education only that misplaced notions of liberty prevent moral obligations on the part of parents from being recognized, and legal obligations from being imposed, where there are the strongest grounds for the former always, and in many cases for the latter also. The fact itself, of causing the existence of a human being, is one of the most responsible actions in the range of human life. To undertake this responsibility -- to bestow a life which may be either a curse or a blessing -- unless the being on whom it is to be bestowed will have at least the ordinary chances of a desirable existence, is a crime against that being. And in a country either over-peopled or threatened with being so, to produce children, beyond a very small number, with the effect of reducing the reward of labor by their competition, is a serious offence against all who live by the remuneration of their labor. The laws which, in many countries on the Continent, forbid marriage unless the parties can show that they have the means of supporting a family, do not exceed the

legitimate powers of the State: and whether such laws be expedient or not (a question mainly dependent on local circumstances and feelings), they are not objectionable as violations of liberty. Such laws are interferences of the State to prohibit a mischievous act -- an act injurious to others, which ought to be a subject of reprobation, and social stigma, even when it is not deemed expedient to superadd legal punishment. Yet the current ideas of liberty, which bend so easily to real infringements of the freedom of the individual, in things which concern only himself, would repel the attempt to put any restraint upon his inclinations when the consequence of their indulgence is a life, or lives, of wretchedness and depravity to the offspring, with manifold evils to those sufficiently within reach to be in any way affected by their actions. When we compare the strange respect of mankind for liberty, with their strange want of respect for it, we might imagine that a man had an indispensable right to do harm to others, and no right at all to please himself without giving pain to any one.

I have reserved for the last place a large class of questions respecting the limits of government interference, which, though closely connected with the subject of this Essay, do not, in strictness, belong to it. These are cases in which the reasons against interference do not turn upon the principle of liberty: the question is not about restraining the actions of individuals, but about helping them: it is asked whether the government should do, or cause to be done, something for their benefit, instead of leaving it to be done by themselves, individually, or in voluntary combination.

The objections to government interference, when it is not such as to involve infringement of liberty, may be of three kinds.

The first is, when the thing to be done is likely to be better done by individuals than by the government. Speaking generally, there is no one so fit to conduct any business, or to determine how or by whom it shall be conducted, as those who are personally interested in it. This principle condemns the interferences, once so common, of the legislature, or the officers of government, with the ordinary processes of industry. But this part of the subject has been sufficiently enlarged upon by political economists, and is not particularly related to the principles of this Essay.

The second objection is more nearly allied to our subject. In many cases, though individuals may not do the particular thing so well, on the average, as the officers of government, it is nevertheless desirable that it should be done by them, rather than by the government, as a means to their own mental education -- a mode of strengthening their active faculties, exercising their judgment, and giving them a familiar knowledge of the subjects with which they are thus left to deal. This is a principal, though not the sole, recommendation of jury trial (in cases not political); of free and popular local and municipal institutions; of the conduct of industrial and philanthropic enterprises by voluntary associations. These are not questions of liberty, and are connected with that subject only by remote tendencies; but they are questions of development. It belongs to a different occasion from the present to dwell on these things as parts of national education; as being, in truth, the peculiar training of a citizen, the practical part of the political education of a free people, taking them out of the narrow circle of personal and family selfishness, and accustoming them to the comprehension of joint interests, the management of joint concerns -- habituating them to act from public or semipublic motives, and guide their conduct by aims which unite instead of isolating them from one another. Without these habits and powers, a free constitution can neither be worked nor preserved, as is exemplified by the too-often transitory nature of political freedom in countries where it does not rest upon a sufficient basis of local liberties. The management of purely local business by the localities, and of the great enterprises of industry by the union of those who

voluntarily supply the pecuniary means, is further recommended by all the advantages which have been set forth in this Essay as belonging to individuality of development, and diversity of modes of action. Government operations tend to be everywhere alike. With individuals and voluntary associations, on the contrary, there are varied experiments, and endless diversity of experience. What the State can usefully do, is to make itself a central depository, and active circulator and diffuser, of the experience resulting from many trials. Its business is to enable each experimentalist to benefit by the experiments of others, instead of tolerating no experiments but its own.

The third, and most cogent reason for restricting the interference of government, is the great evil of adding unnecessarily to its power. Every function superadded to those already exercised by the government, causes its influence over hopes and fears to be more widely diffused, and converts, more and more, the active and ambitious part of the public into hangers-on of the government, or of some party which aims at becoming the government. If the roads, the railways, the banks, the insurance offices, the great joint-stock companies, the universities, and the public charities, were all of them branches of the government; if, in addition, the municipal corporations and local boards, with all that now devolves on them, became departments of the central administration; if the employes of all these different enterprises were appointed and paid by the government, and looked to the government for every rise in life; not all the freedom of the press and popular constitution of the legislature would make this or any other country free otherwise than in name. And the evil would be greater, the more efficiently and scientifically the administrative machinery was constructed -- the more skilful the arrangements for obtaining the best qualified hands and heads with which to work it. In England it has of late been proposed that all the members of the civil service of government should be selected by competitive examination, to obtain for those employments the most intelligent and instructed persons procurable; and much has been said and written for and against this proposal. One of the arguments most insisted on by its opponents is that the occupation of a permanent official servant of the State does not hold out sufficient prospects of emolument and importance to attract the highest talents, which will always be able to find a more inviting career in the professions, or in the service of companies and other public bodies. One would not have been surprised if this argument had been used by the friends of the proposition, as an answer to its principal difficulty. Coming from the opponents it is strange enough. What is urged as an objection is the safety-valve of the proposed system. If indeed all the high talent of the country could be drawn into the service of the government, a proposal tending to bring about that result might well inspire uneasiness. If every part of the business of society which required organized concert, or large and comprehensive views, were in the hands of the government, and if government offices were universally filled by the ablest men, all the enlarged culture and practised intelligence in the country, except the purely speculative, would be concentrated in a numerous bureaucracy, to whom alone the rest of the community would look for all things: the multitude for direction and dictation in all they had to do; the able and aspiring for personal advancement. To be admitted into the ranks of this bureaucracy, and when admitted, to rise therein, would be the sole objects of ambition. Under this regime, not only is the outside public ill-qualified, for want of practical experience, to criticize or check the mode of operation of the bureaucracy, but even if the accidents of despotic or the natural working of popular institutions occasionally raise to the summit a ruler or rulers of reforming inclinations, no reform can be effected which is contrary to the interest of the bureaucracy. Such is the melancholy condition of the Russian empire, as is shown in the accounts of those who have had sufficient opportunity of observation. The Czar himself is powerless against the bureaucratic body: he can send any one of

them to Siberia, but he cannot govern without them, or against their will. On every decree of his they have a tacit veto, by merely refraining from carrying it into effect. In countries of more advanced civilization and of a more insurrectionary spirit the public, accustomed to expect everything to be done for them by the State, or at least to do nothing for themselves without asking from the State not only leave to do it, but even how it is to be done, naturally hold the State responsible for all evil which befalls them, and when the evil exceeds their amount of patience, they rise against the government and make what is called a revolution; whereupon somebody else, with or without legitimate authority from the nation, vaults into the seat, issues his orders to the bureaucracy, and everything goes on much as it did before; the bureaucracy being unchanged, and nobody else being capable of taking their place.

A very different spectacle is exhibited among a people accustomed to transact their own business. In France, a large part of the people having been engaged in military service, many of whom have held at least the rank of noncommissioned officers, there are in every popular insurrection several persons competent to take the lead, and improvise some tolerable plan of action. What the French are in military affairs, the Americans are in every kind of civil business; let them be left without a government, every body of Americans is able to improvise one, and to carry on that or any other public business with a sufficient amount of intelligence, order and decision. This is what every free people ought to be: and a people capable of this is certain to be free; it will never let itself be enslaved by any man or body of men because these are able to seize and pull the reins of the central administration. No bureaucracy can hope to make such a people as this do or undergo anything that they do not like. But where everything is done through the bureaucracy, nothing to which the bureaucracy is really adverse can be done at all. The constitution of such countries is an organization of the experience and practical ability of the nation, into a disciplined body for the purpose of governing the rest; and the more perfect that organization is in itself, the more successful in drawing to itself and educating for itself the persons of greatest capacity from all ranks of the community, the more complete is the bondage of all, the members of the bureaucracy included. For the governors are as much the slaves of their organization and discipline, as the governed are of the governors. A Chinese mandarin is as much the tool and creature of a despotism as the humblest cultivator. An individual Jesuit is to the utmost degree of abasement the slave of his order though the order itself exists for the collective power and importance of its members.

It is not, also, to be forgotten, that the absorption of all the principal ability of the country into the governing body is fatal, sooner or later, to the mental activity and progressiveness of the body itself. Banded together as they are -- working a system which, like all systems, necessarily proceeds in a great measure by fixed rules -- the official body are under the constant temptation of sinking into indolent routine, or, if they now and then desert that mill-horse round, of rushing into some half-examined crudity which has struck the fancy of some leading member of the corps: and the sole check to these closely allied, though seemingly opposite, tendencies, the only stimulus which can keep the ability of the body itself up to a high standard, is liability to the watchful criticism of equal ability outside the body. It is indispensable, therefore, that the means should exist, independently of the government, of forming such ability, and furnishing it with the opportunities and experience necessary for a correct judgment of great practical affairs. If we would possess permanently a skilful and efficient body of functionaries -- above all, a body able to originate and willing to adopt improvements; if we would not have our bureaucracy degenerate into a pedantocracy, this body must not engross all the occupations which form and cultivate the faculties

required for the government of mankind.

To determine the point at which evils, so formidable to human freedom and advancement begin, or rather at which they begin to predominate over the benefits attending the collective application of the force of society, under its recognized chiefs, for the removal of the obstacles which stand in the way of its well-being, to secure as much of the advantages of centralized power and intelligence, as can be had without turning into governmental channels too great a proportion of the general activity, is one of the most difficult and complicated questions in the art of government. It is, in a great measure, a question of detail, in which many and various considerations must be kept in view, and no absolute rule can be laid down. But I believe that the practical principle in which safety resides, the ideal to be kept in view, the standard by which to test all arrangements intended for overcoming the difficulty, may be conveyed in these words: the greatest dissemination of power consistent with efficiency; but the greatest possible centralization of information, and diffusion of it from the centre. Thus, in municipal administration, there would be, as in the New England States, a very minute division among separate officers, chosen by the localities, of all business which is not better left to the persons directly interested; but besides this, there would be, in each department of local affairs, a central superintendence, forming a branch of the general government. The organ of this superintendence would concentrate, as in a focus, the variety of information and experience derived from the conduct of that branch of public business in all the localities, from everything analogous which is done in foreign countries, and from the general principles of political science. This central organ should have a right to know all that is done, and its special duty should be that of making the knowledge acquired in one place available for others. Emancipated from the petty prejudices and narrow views of a locality by its elevated position and comprehensive sphere of observation, its advice would naturally carry much authority; but its actual power, as a permanent institution, should, I conceive, be limited to compelling the local officers to obey the laws laid down for their guidance. In all things not provided for by general rules, those officers should be left to their own judgment, under responsibility to their constituents. For the violation of rules, they should be responsible to law, and the rules themselves should be laid down by the legislature; the central administrative authority only watching over their execution, and if they were not properly carried into effect, appealing, according to the nature of the case, to the tribunal to enforce the law, or to the constituencies to dismiss the functionaries who had not executed it according to its spirit. Such, in its general conception, is the central superintendence which the Poor Law Board is intended to exercise over the administrators of the Poor Rate throughout the country. Whatever powers the Board exercises beyond this limit, were right and necessary in that peculiar case, for the cure of rooted habits of mal-administration in matters deeply affecting not the localities merely, but the whole community; since no locality has a moral right to make itself by mismanagement a nest of pauperism, necessarily overflowing into other localities, and impairing the moral and physical condition of the whole laboring community. The powers of administrative coercion and subordinate legislation possessed by the Poor Law Board (but which, owing to the state of opinion on the subject, are very scantily exercised by them), though perfectly justifiable in a case of a first-rate national interest, would be wholly out of place in the superintendence of interests purely local. But a central organ of information and instruction for all the localities, would be equally valuable in all departments of administration. A government cannot have too much of the kind of activity which does not impede, but aids and stimulates, individual exertion and development. The mischief begins when, instead of calling forth the activity and powers of individuals and bodies, it substitutes its own activity for theirs; when, instead of informing,

advising, and upon occasion denouncing, it makes them work in fetters or bids them stand aside and does their work instead of them. The worth of a State, in the long run, is the worth of the individuals composing it; and a State which postpones the interests of their mental expansion and elevation, to a little more of administrative skill or that semblance of it which practice gives, in the details of business; a State, which dwarfs its men, in order that they may be more docile instruments in its hands even for beneficial purposes, will find that with small men no great thing can really be accomplished; and that the perfection of machinery to which it has sacrificed everything, will in the end avail it nothing, for want of the vital power which, in order that the machine might work more smoothly, it has preferred to banish.
